BR04	E: Survey frequency	9, 13, 14, 16, 20	15 years
		16, 20	10 years
BR05	F: Strategic surveys	1*, 9	Yes + CV = (0.25, 0.25)
		1*, 9	Yes + CV = (0.34, 0.25)
BR06	G: Survey bias time dependence	1	Historic bias: 1.5 constant; Future bias: decreasing (1.5→1)
		1	Historic bias: 0.67 constant; Future bias: increasing (0.67→1)
		9, 9^S	Future bias: sinusoidal from base value in yr 0 to maximum of 150% in eayr 40
		12, 12^S	Future bias: decreases (1.5→1)
		14	Future bias: increases from 1→1.5 in year 25 and constant thereafter (formerly BE15)
BR07	H: Future survey *CV*	1	CV = (0.1, 0.1)
		1*, 1^S	CV = (0.34, 0.25)
		9	(0.1, 0.1) + sinusoidal survey bias (factor G)
BR08	I: Historic catch bias	14, 16*, 16^S,20*	0.5
		14, 16, 16^S	1.5
BR09	K: Time dependence in *K*	1, 2*, 9, 10	*K* halves linearly over 100 years
		1, 2*, 9, 10	*K* doubles linearly over 100 years
		1	*K* varies sinusoidally from base value in year 0 to maximum of 150% in year 40
		1, 21	Tent *K: K* doubles linearly between years -50 to 0 and halves between years 0 to 50
		1, 9	*K* halves linearly over 100 years + strategic surveys
BR10	L: Time dependence in *MSYR*	10	*MSYR* halves linearly over 100 years
		9	*MSYR* doubles linearly over 100 years
		1, 2*, 8	Step *MSYR* 2½%→1%→2½% every 33 years (alone)
		1, 2*, 8	Step *MSYR* 2½%→1%→2½% every 33 years in sync with *M* (compute *MSYR* first) – if it is practical (halve *M* for each age class)
		1	*K* and *MSYR* halve linearly over 100 years
		1, 21	*K* and *MSYR* vary as tent *K* (see BR09)
BR11	M: Time dependence in *M*	1, 2*, 9, 10	*M* halves linearly over 100 years
		1, 2*, 9, 10	*M* doubles linearly over 100 years
BR12	N: Episodic events	1, 1^S, 2*, 9, 9^S, 10*, 10^S*	Two events in which 20% of animals die occur between years 1-50
BR13	O: Integrated.	1, 11, 14	$MSYR_{1+}$~U[0.01, 0.04]; fixed $MSYL_{1+}$=0.6
		11, 14	$MSYR_{1+}$~U[0.01, 0.04]; $MSYL_{1+}$~U[0.4, 0.8]
		1, 1^S, 2*, 11, 11^S, 14	$MSYR_{1+}$~U[0.01, 0.04]; $MSYL_{1+}$~U[0.4, 0.8]; historical catch bias ~U[0.5, 1.5]; Serial correlation ~ U[0.47, 0.95]
		1^S, 11^S	$MSYR_{1+}$~U[0.01, 0.04]; $MSYL_{1+}$~U[0.4, 0.8]; historical catch bias ~U[0.5, 1.5]; Serial correlation ~ U[0.47, 0.95]; time delay in density dependence ~U[0, 30]
BR14	P: Initial year of population projection	1, 9, 10*	1940 (reference or base case level is 1848)
BR15	Q: $MSYL_{1+}=0.9$	1, 9, 10	
BR16	R: Different stochastic parameters	1^S	Correlation in recruitment ρ = *-0.75*
		1^S	Correlation in recruitment ρ = *0.9*
		1^S, 9^S, 10^S	Correlation in recruitment ρ = *0.9;* + episodic events
		1^S	Change s_e^2 to give 3* variation in population size at equilibrium
		1^S, 9^S	Serial correlation = *0.9* + change s_e^2 to give 3* equilibrium variation +episodic events
BR17	S: Time lag in density dependence	9*	20 year time lag

Table 3

Factors and ranges for constructing the *Cross-validation Trial*s.

Factor	Range
$MSYR_{1+}$	1 – 4%
$MSYL_{1+}$	0.4 – 0.8
Final need	67 – 201
Survey bias in future year 25	0.67 – 1.5
Estimated survey CV	0.1 – 0.4*
Time-lag	0 – 20

* Modified from 0.25 agreed at the last meeting.

Dr N. Grandy, Secretary to the Commission, 25 April 2005

Preface

Welcome to the seventh of the series, the '*Annual Report of the International Whaling Commission*'. Subscription details for the publications of the International Whaling Commission can be found on the Commission web site (*www.iwcoffice.org*), by e-mailing *subscriptions@iwcoffice.org* or by the more traditional means of writing, telephoning or faxing the Office of the Commission (details are given on the title page and on the back cover of this volume).

This report contains the Chair's Report of the Fifty-Sixth meeting of the IWC, held in Sorrento, Italy in July 2004. The text of the Convention and its Protocol are also included, as well as the latest versions of the Schedule to the Convention and the Rules of Procedure and Financial Regulations. The Chair's Report includes the reports of the Commission's technical and working groups as annexes.

This year has seen the retirement of one of the longest-serving members of the Secretariat, Daphne Ransom, the Assistant to the Executive Officer. Daphne had served the IWC admirably since the establishment of a permanent Secretariat in 1976. The Commission offers its best wishes for her in the future.

Cover photograph: Statue of St Antonino, an Abbot and the patron Saint of Sorrento, thought to have died on 14 February 830AD. He is a popular saint amongst seamen. The most famous miracle attributed to him was that he freed a young boy swallowed by a whale.

G.P. DONOVAN

SUMMARY OF MAIN OUTCOMES, DECISIONS AND REQUIRED ACTIONS FROM THE 56TH ANNUAL MEETING

The main outcomes, decisions and required actions arising from the 56th Annual Meeting of the IWC are summarised in the table below.

Issue	Outcomes, decisions and required actions
Status of stocks	**Antarctic minke whales** • Completion of the revised abundance estimate for Antarctic minke whales continues to be a high priority given that there is no agreed current estimate. **Western North Pacific common minke whales** • The Scientific Committee expects to begin an in-depth assessment of western North Pacific common minke whales, with a focus on the J stock, at next year's Annual Meeting. **Southern Hemisphere blue whales** • The Scientific Committee agreed that (1) on average, the Antarctic blue whale population is increasing at a mean rate of 7.3% per year; (2) had an estimated circumpolar population size of 1,700 (95% CI 860-2,900) in 1996; and (3) that this population is still severely depleted compared with pre-exploitation levels. **Right whales** • The Scientific Committee again reiterated its recommendation that it is a matter of absolute urgency that every effort be made to reduce anthropogenic mortality in the North Atlantic right whale stock to zero. Right whales continue to die or become seriously injured by entanglements in fishing gear or ship strikes. The remaining population is estimated at between 300 and 350 animals. **Western North Pacific gray whales** • The Scientific Committee noted with great concern that the evidence is compelling that this population (only about 100 whales) is in serious danger of extinction and that it faces an obvious and immediate threat from industrial activities, including noise, vessel traffic and the potential for a catastrophic oil spill. It recommended as a matter of urgency that measures be taken to protect this population and its habitat off Sakhalin Island and that research and monitoring programmes on this stock by range states continue and expand. • The Commission adopted Resolution 2004-1 that *inter alia*: (1) endorsed the Scientific Committee's conclusions and recommendations; (2) called on range states to actively pursue all practicable actions to eliminate anthropogenic mortality in this stock and to minimise anthropogenic disturbances in the migration corridor and on breeding and feeding grounds; and (3) requested the Secretariat to offer its services and scientific expertise to organisations concerned with oil and gas development projects and exploration projects in the Sakhalin area. **Small cetaceans** • The Scientific Committee reviewed the status of franciscana and made a number of recommendations including the need for improved estimates of abundance and bycatch. The Committee expressed concern over the status of the vaquita and West Greenland stocks of white whales and narwhals.
Aboriginal subsistence whaling	**Aboriginal Whaling Management Procedure** • The Commission endorsed and adopted the *Strike Limit Algorithm (SLA)* for eastern North Pacific gray whales proposed by the Scientific Committee. This follows the 2002 adoption of an *SLA* for the Bering-Chukchi-Beaufort stock of bowhead whales. The Committee will now work to develop a similar approach for the management of Greenlandic whaling. **Catch limits** • The Commission agreed that no changes to the block quotas renewed in 2002 were needed. The Scientific Committee reiterated its grave concern at being unable to provide management advice on Greenlandic whaling. **Review of Schedule paragraph 13** • Schedule language dealing with the different aboriginal subsistence hunts was consolidated and harmonised.

Issue	Outcomes, decisions and required actions
Whale killing methods and associated welfare issues	• The Commission passed Resolution 2004-3 requesting further work from the Working Group on Whale Killing Methods and Associated Welfare Issues, and in particular to: ➢ examine methods for reducing struck and lost rates; ➢ consider the welfare implications of methods used to kill whales caught in nets; ➢ advise the Commission on establishing better criteria for determining the onset of irreversible insensibility and death, methods for improving the efficiency of whale killing methods and reducing times to death and other associated welfare issues.
The Revised Management Scheme (RMS)	• The Commission endorsed the Scientific Committee's *Requirements and Guidelines for Implementations* and the revised *Requirements and Guidelines for Conducting Surveys and Analysing Data within the RMP.* • The Commission endorsed the Scientific Committee recommendation to initiate a *pre-implementation assessment* for North Atlantic fin whales and the plans to hold a Workshop on the *pre-implementation assessment* of western North Pacific Bryde's whales. • The Commission reviewed a proposal from the Chair for an RMS 'package' of measures. No agreement was reached but Resolution 2004-6 was adopted aimed at having draft text and technical details of an RMS ready for consideration, including for possible adoption, at IWC/57, and/or to identify any outstanding policy and technical issues. The Resolution included a plan of work that revived the RMS Working Group (that last met at IWC/54 in 2002), established a Small Drafting Group and various technical specialist groups and required considerable intersessional work.
Sanctuaries	**Southern Ocean Sanctuary (SOS)** • The Scientific Committee completed its review of the sanctuary as required by the Schedule. The Committee agreed that: (1) whales are not effectively protected from whaling in the SOS, because such Sanctuaries apply only to commercial whaling, and because (apart from stocks that migrate to the IOS) whales also migrate outside of the SOS boundaries; (2) the boundaries of the SOS were appropriately established for some, but not for all stocks; (3) it was not possible to completely evaluate the effectiveness of the SOS because the scientific objectives are not clear and are not associated with quantifiable performance measures. The Committee respectfully requested that the Commission considers clarifying the objective(s) of the SOS in order to allow the Committee to discriminate among designs that would, *inter alia*: protect whales; protect whale species diversity; and increase whaling yields outside the Sanctuary. • A proposed Schedule amendment that would abolish the Southern Ocean Sanctuary and authorise the take of 2,914 minke whales for each of the 2004/05 to 2008/09 seasons was not adopted. • The next SOS review will take place in 2014 unless the Commission decides otherwise. **Proposals for new sanctuaries in the South Pacific and South Atlantic** • As last year, two Schedule amendments were proposed to create sanctuaries in (1) the South Pacific and (2) the South Atlantic. Neither was adopted.
Socio-economic implications and small-type whaling	• Two proposed Schedule amendments that would allow the resumption of community based whaling in Japan were not adopted. One proposal was for the taking of 100 minke whales each year for 3 years from the Okhotsk Sea-West Pacific stock. The other was for the taking of 150 Bryde's whales each year for 5 years from the western North Pacific stock. • Resolution 2004-2 was adopted, reaffirming the Commission's commitment to work expeditiously to alleviate the continued difficulties to the Japanese coastal communities of Abashiri, Ayukawa, Wadaura and Taiji caused by the cessation of minke whaling.
Scientific Permits	• Discussions of the Scientific Committee focused on reviewing the results and future plans for the ongoing programmes of Japan (i.e. JARPA and JARPNII) and Iceland. No consensus recommendations were made. Given that 2004/05 would be the last year of JARPA, the Committee agreed that it will undertake a full review of results from this 16-year programme once they are available, i.e. some time after the Annual Meeting in 2005. • Last year, the Commission adopted Resolution 2003-3 that *inter alia*: (1) called on the Government of Japan to halt the JARPA programme or limit it to non-lethal research methodologies; and (2) recommended that no additional JARPA programmes be considered until the Scientific Committee has completed a review of (a) all JARPA results and (b) its abundance estimates for Southern Hemisphere minke whales. The Resolution also recommended that any future programmes should be limited to non-lethal research. As this Resolution remains in force, and to save time, Australia and other co-sponsors withdrew a similar proposed Resolution this year.

Issue	Outcomes, decisions and required actions
Environmental issues	• The Scientific Committee agreed that there is now compelling evidence that military sonar has a direct impact on beaked whales in particular and that evidence suggests that some sound from other sources, including ships and seismic activities, gives cause for concern. • The Committee reported on progress with work on other habitat-related issues, including POLLUTION 2000+, collaborative research in the Antarctic, SOCER, Arctic issues and the habitat degradation workshop scheduled to take place in Siena in November 2004. • Discussions on ways to advance collaboration between the Standing Working Group on the Environment and the assessment-related sub-committees and working groups was initiated.
Conservation Committee	• The first meeting of the Conservation Committee took place. It addressed general issues relating to the establishment and purpose of the Committee and considered: (1) its relationship with other bodies within the Commission; (2) terms of reference and working methods; (3) items that should fall under its auspices; (4) collaboration with other organisations; and (5) the development of a Conservation Agenda.
Co-operation with other organisations	• The Commission adopted Resolution 2004-5 that requested the Secretariat, *inter alia*, to explore possible synergies between IWC and the Global Environment Facility, including possible support of the involvement of developing country IWC members in projects related to scientific research and/or policies for scientific research concerning the conservation and management of whales.
Future work of the Scientific Committee	• The Commission adopted the report from the Scientific Committee, including its proposed work plan for 2004/2005 that includes activities in the following areas: • Revised Management Procedure (RMP), particularly with respect to (1) finalising the guidelines and requirements for implementing the RMP; (2) completion of the *pre-implementation assessment* for western North Pacific Bryde's whales; and (3) development of stock structure hypotheses as part of the *pre-implementation assessment* for North Atlantic fin whales. • Estimation of bycatch based on genetic data and data from fisheries and observer programmes. • Aboriginal Subsistence Whaling Management Procedure development particularly in relation to Greenlandic whaling. • Annual reviews of catch data and management advice for eastern North Pacific gray whales, BCB bowhead whales, minke and fin whales off Greenland and humpback whales off St. Vincent and The Grenadines; • In-depth assessments, with particular emphasis on abundance estimates for Southern Hemisphere minke and humpback whales; • Review of the stock identity concept in a management context; • Environmental concerns, with a focus on reviewing the report of the Habitat Degradation Workshop and the outcome of the special session on sea ice and whale habitat; • Whalewatching (WW), with a focus on assessing possible population level impacts of WW on whales and the development of a scientific foundation for WW guidelines; • Small cetaceans, including a review of the status of the finless porpoise. • The Scientific Committee also agreed, that given the case- and area-specific nature of the bycatch problem, to hold a series of broad-based regional Workshops focusing on regions where bycatch problems: (1) have been given priority by the Scientific Committee as part of its normal review process; and (2) are not already being addressed.
Secret ballots	• A proposed amendment to the Commission's Rules of Procedure that would increase the opportunities for using secret ballots was not adopted.
Dealing with legal issues	• The Commission reviewed a paper outlining options on how it might address future legal issues arising within the IWC. The matter was referred to the meeting of the F&A Committee at IWC/57.
Administration	**Simultaneous interpretation and document translation** • The Commission agreed that from IWC/57 next year, equipment facilities for simultaneous interpretation into French and Spanish should be provided for the Commission's sub-groups (but not the Scientific Committee), the Commission plenary and private meetings of Commissioners. Governments wishing to make use of these facilities would have to provide the interpreters at their own cost.

Issue	Outcomes, decisions and required actions
Administration cont.	• The Commission also agreed to establish a small Task Force to work with the Secretariat to develop cost estimates and implications for the provision of document translation at Annual Meetings and to report to the F&A Committee at IWC/57. **Amendments to the Rules of Procedure and Financial Regulations** • The Commission adopted revised rules regarding the procedure for the appointment of the Chair and Vice-Chair of the Scientific Committee. **Frequency of meetings** • Via Resolution 2004-7 the Commission decided to explore the principle of IWC meetings being held less frequently than annually as at present. It agreed to establish a working group to investigate and make recommendations on the implications of less frequent meetings. The Working Group should report to the Commission next year.
Financial Contributions	Interim Measure • The Commission adopted Resolution 2004-4 designed to take into account the special position of very small countries in calculating financial contributions. Under the Interim Measure for calculating contributions, member countries are allocated into four capacity-to-pay groups based on their GNI and GNI per capita. Via Resolution 2004-4, the Commission decided that Monaco and San Marino should be transferred from capacity-to-pay Group 3 to Group 2 in view of their much smaller GNI compared with other countries in Group 3. This has the effect of reducing the financial contributions of Monaco and San Marino.
Finance and Budget	**Financial statements and budget estimates** • The Commission approved the Provisional Financial Statement for 2003-2004 subject to audit. It also approved the budget for 2004-2005, including the research budget, and increases in the NGO observer fee from £570 to £590 and in the media fee from £30 to £35 for 2005. **Secretariat office accommodation** • The Commission agreed that for a number of reasons it would not be practical to relocate the Secretariat's offices away from the Cambridge area, but requested the Secretariat to explore alternative premises locally. **Budgetary Sub-committee** • The Commission agreed changes to the membership rota for the Budgetary Sub-committee that included extending the term of members from two to three years, appointing a Vice-Chair as well as a Chair and creating two 'open seats' in addition to the nine allocated on the basis of the capacity-to-pay grouping. The Budgetary Sub-committee was requested to clarify the term for the open seats and the status of observers from Contracting Governments not members of the Sub-committee.
Non-governmental organisations	**Participation** • The Commission requested the Secretariat to work with the Advisory Committee to explore how the Rules of Procedure might be amended with respect to criteria and fees for NGO participation (e.g. removal of the current requirement that NGOs must have offices in more than three countries; allowing NGOs to have more than one observer in the meeting room at any one time; revising the fee structure such that the effect of these changes, if put in place, would not have a significant impact on fees). **Code of Conduct** • The Commission agreed to establish a Working Group comprising Dominica, Iceland (convenor), Japan, the Netherlands, New Zealand, St. Kitts and Nevis, Sweden and the USA to develop a draft Code of Conduct for NGOs for review at IWC/57. The code was to focus on NGO activities during the Annual Meeting and could, if appropriate, include provisions related to the loss of accreditation.
Date and place of Annual Meetings	• The 57th Annual and associated meetings in 2005 will be held in Ulsan, Republic of Korea during the period 30 May to 24 June. • The 58th Annual Meeting in 2006 will be held in St Kitts and Nevis. The dates are to be determined.
Election of the Vice Chair	• Horst Kleinschmidt (South Africa) was elected as Vice-Chair to replace Carlos Dominguez Diaz (Spain).
Advisory Committee	• The Commissioner from Dominica was elected onto the Advisory Committee for a further two years to join the Chair (Denmark), the Vice-Chair (South Africa), the Head of Finance and Administration (Norway) and the UK Commissioner.

Chair's Report of the 56th Annual Meeting

1. INTRODUCTORY ITEMS

1.1 Date and place

The 56th Annual Meeting of the International Whaling Commission (IWC) took place from 19-22 July 2004 at the Hilton Sorrento Palace Hotel, Italy. In the absence of the Chair, Henrik Fischer (Denmark) and Vice-Chair, Carlos Dominguez (Spain) who were both unable to attend, the Commission elected by consensus Rolland Schmitten (USA) and Minoru Morimoto (Japan) as Acting Chair and Vice-Chair respectively for the duration of the meeting. A list of delegates and observers attending the meeting is provided in Annex A. The associated meetings of the Scientific Committee and Commission sub-groups were held at the same venue in the period 28 June to 16 July.

1.2 Welcome addresses

On the first morning of the meeting, Dr Giuseppe Ambrosio, Italy's Commissioner to IWC welcomed all participants on behalf of the Government of Italy. He began by noting that while Italy gives great importance to the protection of cetaceans and is against the resumption of commercial whaling, it also respects those having different cultures and beliefs. He believed that because the concept of conservation is inextricably intertwined with the sustainable use of natural resources, it is logical that the conservation of whales be given due attention. Referring to Italy's concern with regard to degradation of the marine environment, Dr Ambrosio was pleased to note that an IWC workshop on the effects of habitat degradation on cetaceans was scheduled to take place in Siena later in the year. He stressed the importance Italy gives to the use of sanctuaries and marine protected areas in cetacean conservation, given the uncertainties regarding the effects global changes have on the environment, and noted that together with France and Monaco, Italy had established a large sanctuary for the protection of cetaceans in the Mediterranean – 50% of which is in the high seas. Dr Ambrosio indicated that Italy would support the establishment of new sanctuaries in the Southern Hemisphere. Finally, he hoped that the pleasant setting of Sorrento would be conducive to the work of the Commission and that its deliberations would lead to concrete progress in protecting an important natural heritage for which all share responsibility.

A welcome address was also given by the On. Scarpa, Undersecretary of State, Ministero delle Politiche Agricole e Forestali at the opening of the second day of the meeting. Recognising fisheries as an ancient activity on the one hand but at the same time a modern and very topical activity, the On. Scarpa noted that regulating fisheries is as hard, if not harder than regulating other sectors of the economy because of the pressure placed on those responsible. He further noted that fisheries is an area where new policies are being tested to find the right balance between the conservation of natural resources and their commercial use, and referred to work within the European Union to develop a set of shared goals for fisheries in the Mediterranean. He stressed the need to involve all stakeholders, including the fishermen themselves. While being aware of the need to manage the social and cultural problems encountered in conservation, the On. Scarpa believed that cetacean conservation also requires scientists, governments, NGOs and the few whalers left to reflect on how this resource can be protected, noting the multiple risks to which cetaceans are exposed. He considered that the notion of a common resource is particularly cogent for cetaceans and referred to the United Nations Convention of Law of the Sea (UNCLOS) that allows governments to adopt more stringent conservation measures for cetaceans that those that might apply to other species. He also referred to the Monaco Agreement of November 1996 that acknowledges cetaceans as an integral part of the ecosystem and an agreement that has led governments to adopt a common approach to addressing a problem of common interest. Finally, he did not want the negative opinion expressed by some on whaling (an activity in which few are engaged) to influence the general opinion on fisheries (an activity that affects everyone). He saw no need for conflict between the environment and fishermen, stressing that there must be a relationship of mutual understanding with shared goals.

1.3 Opening statements

The Chair welcomed the following six new Contracting Governments who had adhered since the last Annual Meeting:

- Mauritania – adhered on 23 December 2003;
- Hungary – adhered 1 June 2004;
- Tuvalu – adhered 30 June 2004;
- Côte d'Ivoire – adhered 8 July 2004;
- Belgium – adhered 14 July 2004; and
- Suriname – adhered 14 July 2004.

Reminding the meeting that the Commission's practice is to invite oral opening statements only from new Contracting Governments – existing Contracting Governments and observers can submit written opening statements – the Chair invited the new member countries to address the meeting.

Mauritania noted that as a state with a coastline of over 700km, fishing has a predominant role, generating more than 50% of export income and about 25% of budgetary income. Its strategy for the exploitation of marine fishery resources is based on their sustainable use, but it also supports the protection of endangered marine species. Mauritania explained that this strategy is also the basis for its adherence to the IWC and to all other institutions involved in the regulation and management of marine resources. It noted that it will base its decisions on science and, where insufficient data are available, on the application of the precautionary principle.

Hungary noted that as a small country with high biodiversity, it has made great efforts to protect its environment. These efforts have been further strengthened by its recent accession to the European Union. It reported that over 10% of its territory is protected, with 10 national parks – one of which was established over 30 years ago. It has more than 1,000 protected species for which trade is prohibited. Although it is a land-locked country, Hungary believed that it could contribute to the preservation of the oceans – a common heritage of mankind.

Tuvalu noted that its territory comprises eight low-lying atolls and reef islands scattered across the central Pacific Ocean. While its total land area is only 26 square kilometres, its ocean area covers almost one million square kilometres. Tuvalu therefore relies heavily on marine resources and is keenly aware of the impact of overfishing. It wishes to use and conserve marine resources wisely and prevent overexploitation. Since 1978, its national policies have tried to increase fish catches in Tuvalu waters, identify new stocks that have the potential for commercial exploitation, maximise financial returns from foreign fishing operators, and to improve the domestic management of its marine resources. Although whales migrate through its waters, there is no reliable inventory of species and numbers. Tuvalu wishes to establish a long-term whale research programme and would be pleased to receive any technical support, assistance and guidance from IWC or from any of its members in launching such an initiative. It looked forward to working closely with members of the Commission to achieve the Commission's long term goals.

Côte d'Ivoire noted that it has given full support to Conventions aimed at the rational and sustainable exploitation of natural resources, particularly marine resources and adheres fully to the spirit and word of the International Convention for the Regulation of Whaling. It would support Commission resolutions for a sustainable and responsible use of whale resources based on sound science and to this end suggested that the RMS should be completed and implemented. It also noted its determination to work with other Contracting Governments to ensure the preservation of whale stocks.

Belgium noted that its adherence to the Convention was supported strongly by its parliament and civil society. It believed its adherence is coherent with Belgium's early expeditions in Antarctica and its participation as founding members of the Antarctic Treaty and CCAMLR. It also believed it significant that Belgium was joining IWC at the time the Conservation Committee is being launched. It noted that it will work actively and constructively with all Commission members towards a high level of governance, transparency and efficiency with a view to taking the right decisions for the benefit of present and future generations and in collaboration with other international bodies.

Suriname noted that it supports the principle of the sustainable use of all marine living resources, including cetaceans. As part of the Amazon region, it is well-endowed with freshwater and arable land as well as valuable fishery resources. Deep-sea fishing is the largest exporting industry within Suriname's agricultural sector. Suriname has made significant investments to make its fishing industry viable and has taken measures to comply with all international regulations regarding sustainability and biodiversity. It has followed the debate in IWC for many years and is surprised that whales, which consume large quantities of fish, are regarded by many as a resource that should remain unutilised at a time when nations are striving to maintain food security. Suriname recognised IWC as the global authority in relation to the management of whales and the regulation of whaling, but expected it to respect the interests of both the resources and the users of those resources and to base decisions on the best scientific advice available.

1.4 Credentials and voting rights

The Secretary reported that the credentials committee, comprising Japan, New Zealand and the Secretary, agreed that all credentials were in order. She noted that voting rights were suspended for Costa Rica, Côte d'Ivoire, Morocco and Senegal and that when voting commenced she would call on Gabon first. Senegal's voting rights were restored later in the meeting.

1.5 Meeting arrangements

The Chair asked Contracting Governments to:

(1) keep Resolutions to a minimum and to consult widely in their preparation; and
(2) be brief and to the point in their interventions, and to associate themselves, where possible, with earlier speakers who had similar views.

He reconfirmed previous arrangements regarding speaking rights for Intergovernmental Organisations (IGOs), i.e. that he would allow them to make one intervention on a substantive agenda item and that any IGO wishing to speak should let him know in advance. The Secretary drew attention to the arrangements for the submission of Resolutions and other documents.

2. ADOPTION OF THE AGENDA

The Chair drew attention to the provisional annotated agenda and to his proposed order of business. He noted that because of the change in responsibilities of Carlos Dominguez that prevented him from continuing as Vice-Chair of the Commission, a new Vice-Chair needed to be elected. He proposed that a new Item 25 be inserted to deal with this matter. The adopted agenda is given in Annex B. Noting that he was aware of differing views among Contracting Governments as to whether some of the items should be on the agenda, he proposed that, as in previous years, these differences be noted and the agenda adopted with all items retained.

As last year, Japan indicated that it believed a number of items on the agenda were contrary to the objectives or outside the scope of the Convention and that discussion of these matters detracts from the time and resources available to address what in its view were more serious and substantive issues. Japan therefore proposed deletion of Item 7 on whale killing methods and associated welfare issues, Items 8.3 and 8.4 on sanctuaries for the South Pacific and South Atlantic respectively (which had already been discussed thoroughly and rejected by the Commission many times), Item 11 on environmental and health issues, Item 12 on whalewatching, Item 14.1 on small cetaceans and Item 15 on the Conservation Committee. Benin, Republic of Palau, Republic of Guinea, Norway, Gabon, Iceland, St. Kitts and Nevis, St. Lucia, Dominica, Nicaragua, Mauritania, and Morocco spoke in support of Japan. However, the UK, supported by Germany, New Zealand, Italy, India, the USA, Mexico, Brazil, Monaco, Peru, Australia, Spain, and Sweden, could not agree to Japan's proposals. The UK referred to the lengthy discussion on the same issue at last year's Annual Meeting, noted Japan's views, but considered that the items mentioned were legitimate and that it was vital they remained on the agenda and were discussed.

Japan noted the many views both for and against its proposals. Not wishing to prolong the discussion, it withdrew its proposals to delete certain items but indicated that it would make its positions on them clear when those items were discussed.

3. SECRET BALLOTS

3.1 Proposed amendment to Rule of Procedure E.3(d)

Japan again introduced its proposed amendment (that was unsuccessful at the 2001, 2002 and 2003 Annual Meetings[1]) to broaden the application of secret ballots, i.e.

> 'Votes can be taken by show of hands, or by roll call, as in the opinion of the Chairman appears to be most suitable, or by secret ballot if requested by a Commissioner and seconded by at least five other Commissioners except that on any matter related to aboriginal subsistence whaling, voting by secret ballot shall only be used when all the Commissioners representing the Contracting Parties where the aboriginal subsistence take or takes will occur requests the use of a secret ballot and where such requests are seconded by at least five other Commissioners.'

In addition to being available for electing the Chair and Vice-Chair of the Commission, appointing the Secretary of the Commission and selecting Annual Meeting venues – the current situation, Japan believed that voting by secret ballot should be possible for setting catch limits and deciding other regulatory measures. It again noted that the secret ballot is a system commonly used in other international organisations including fisheries management bodies and saw no reason why its proposal should not be accepted by the Commission.

3.2 Commission discussions and action arising

Iceland, Republic of Guinea, Dominica, Antigua and Barbuda, Mauritania, Republic of Korea, Republic of Palau, Norway, Benin, St. Kitts and Nevis, Grenada, St. Vincent and The Grenadines, St. Lucia, Nicaragua, China, Gabon, Tuvalu, Morocco and Dominica spoke in support of Japan's proposal. Iceland noted that national elections are performed by secret ballot and that the same principles should apply internationally. It felt it important that less powerful nations should be able to work without undue pressure from others. As in previous years, Norway believed that transparency should be employed wherever possible but supported Japan's proposal given the real threats of coercion and intimidation surrounding the whaling debate. Others made similar remarks.

The USA, New Zealand, Germany, Italy, UK, Kenya, Australia, Brazil, Monaco, Mexico, Sweden, South Africa, India, Peru, Netherlands, Argentina, Finland, Denmark, Spain, Portugal, France and Switzerland indicated that they could not support the proposal believing it to be contrary to the principles of openness and transparency. Referring to Iceland's comment, Switzerland accepted that secret ballots are appropriate at the level of the individual citizen, but that in the context of intergovernmental organisations, it believed it important that the public be aware of how their countries vote.

In response to a question from Argentina regarding why, in the proposal, there were additional conditions related to secret votes for aboriginal subsistence whaling, Japan explained that this had been included in view of the frequent calls for matters related to aboriginal subsistence whaling to be decided by consensus. Regarding the number of seconds required for a secret ballot, Japan noted that within CITES, a secret ballot can proceed if requested by one country and seconded by 10 others. As IWC has fewer member governments than CITES, Japan proposed that a call for a secret ballot need only be seconded by five countries.

On being put to a vote, the proposal failed to achieve a majority and was therefore not adopted. There were 24 votes in support of the proposal and 29 against.

4. WHALE STOCKS[2]

4.1 In-depth assessment of western North Pacific common minke whales

4.1.1 Report of the Scientific Committee

The Committee reviewed the progress made by an intersessional steering group established last year to plan for the in-depth assessment of western North Pacific common minke whales, with a focus on 'J' stock. The Committee developed a series of priority research items that needed to be accomplished before an assessment could be undertaken, including: analysis of survey data; further work on stock identity; and consideration of ways to elucidate the proportion of 'J' stock animals found in the Sea of Japan. It entrusted this work to a further intersessional group.

4.1.2 Commission discussion and action arising

Japan believed that a reported increase in bycatch of 'J' stock animals is a sign of increasing abundance of this stock which its own research suggests to be greater than 15,000 animals. It anticipated that this would be elucidated by the in-depth assessment. The Republic of Korea was pleased to have started work on this stock around the Korean Peninsular. It too believed that the 'J' stock is increasing, but believed that it should be referred to as the 'Korean peninsular stock'.

The UK, supported by Australia, was concerned by the apparent change in position regarding the abundance of this stock. It recalled that last year, the Scientific Committee had taken a very precautionary variant when determining stock abundance. While it did not dispute that bycatch could be increasing, it suggested that this could be due to a number of reasons, including changes in the distribution of the animals or the effort expended in setting nets.

The Commission noted the Scientific Committee report and endorsed its recommendations.

4.2 Antarctic minke whales

4.2.1 Report of the Scientific Committee

The Committee has carried out annual surveys in the Antarctic (south of 60°S) since the late 1970s. The last agreed estimates for each of the six management Areas for minke whales were for the period 1982/83 to 1989/90. At the 2000 meeting, the Committee agreed that whilst these represented the best estimates for the years surveyed, they were no longer appropriate as estimates of current abundance. An initial analysis of available recent data had

[1] *Ann. Rep. Whaling Comm.* 2001:8, 2002:8 and 2003:6.

[2] For details of the Scientific Committee's deliberation on this item see *J. Cetacean Res. Manage.* 7 (Suppl.).

suggested that current estimates might be appreciably lower than the previous estimates[3].

Subsequently, considerable time has been spent considering Antarctic minke whales with a view to obtaining final estimates of abundance and considering any trend in these. This has included a review of data collection methods and analytical methodology. After considering many of the factors affecting abundance estimates, there is still evidence of a decline in the abundance *estimates*, although it is not clear how this reflects any *actual* change in minke abundance. Three hypotheses that might explain these results have been identified:

(1) a real change in minke abundance;
(2) changes in the proportion of the population present in the survey region at the time of the survey; or
(3) changes in the survey process over time that compromise the comparability of estimates across years.

A considerable amount of work has been undertaken and further work is ongoing. The final part of the Third Circumpolar Survey undertaken as part of the IWC's SOWER research programme has been completed. This work will again be a priority item for discussion at next year's Scientific Committee meeting. Particular attention will be given to the potential relationship between minke whale distribution and the extent and nature of sea ice.

4.2.2 Commission discussion and action arising

Japan considered that the difference in abundance estimates between CPII and CPIII cannot be fully explained by biological reasons and that the employment of different survey designs, survey methods and timing between the series, as well as differences in sea ice, may have had an impact. It was therefore pleased to see that the Scientific Committee is now working on elucidating the reasons for these differences and awaited the outcome with interest. Japan noted that results from JARPA do not show any sign of declines in abundance and concluded that stock abundance is stable, supporting the view that the differences between CPII and CPIII are apparent.

Australia noted that Japan's suggestion that abundance estimates are stable is not the consensus view of the Scientific Committee. Rather it believed it to be clear that uncertainty surrounding stock abundance continues and drew attention to the high priority given by the Scientific Committee on this issue. Referring to its comments on this matter in earlier years, Australia again expressed concern that a large number of minke whales are being taken in the Antarctic despite the uncertainty in stock abundance. The USA and Germany agreed.

St. Lucia congratulated those involved in the SOWER series and thanked Japan for providing the vessels and support to this work. It urged other governments with similar resources to contribute in a similar fashion to ensure continuation of this important work.

The Commission noted the Scientific Committee report and endorsed its recommendations.

[3] *J. Cetacean Res. Manage.* 3 (Suppl.): 29-32.

4.3 Southern Hemisphere whales other than minke whales

4.3.1 Report of the Scientific Committee

4.3.1.1 HUMPBACK WHALES

Considerable progress has been made in recent years in working towards an assessment of humpback whales. Attention has focussed both on data from historic whaling operations and on newly acquired photo-identification, biopsy and sightings data. The Committee made a number of research recommendations to further progress towards an assessment. An intersessional group was established last year to review progress and determine whether it is feasible to set a deadline for the assessment to be completed. Further work was identified this year and progress was reviewed. Further work remains to be completed.

4.3.1.2 BLUE WHALES

The Committee is beginning the process of reviewing the status of Southern Hemisphere blue whales. An important part of this work is to try to develop methods to identify pygmy blue whales from 'true' blue whales at sea and progress is being made on this. Work on genetic and acoustic differentiation techniques is continuing and there is considerable progress with morphological methods. The Committee has agreed on a number of issues that need to be resolved before it is in a position to carry out an assessment, which it believes should commence in 2006. This year, the Committee reviewed a paper by Branch *et al.* (2004[4]). The Committee agreed that this research supported the conclusions that: (1) on average, the Antarctic blue whale population is increasing at a mean rate of 7.3% per annum (95% CI 1.4–11.6%); (2) had an estimated circumpolar population size of 1,700 (95% CI 860–2,900) in 1996; and (3) that this population is still severely depleted with the 1996 population estimate estimated to be at 0.7% (95% CI 0.3–1.3%) of the estimated pre-exploitation level.

4.3.2 Commission discussion and action arising

Australia was encouraged that Southern Hemisphere humpback whales are apparently increasing in and around its waters and reported that it is good news for its whalewatching industry that relies on increasing numbers of humpback whales. Believing that some sightings surveys and modelling exercises may be over-estimating the numbers of some humpback populations, Australia looked forward to greater clarity of what it believed were apparent anomalies.

Japan reported that results from JARPA indicated sharp increases in the numbers of humpback and fin whales. It quoted estimates of 41,000 for humpbacks whales and 15,000 for fin whales in the north of the survey area (suggesting an estimate of 68,000 for the total stock). Australia, the UK and New Zealand believed these estimates to be flawed. Japan responded that the areas where these increases have been seen are south of 60°S. It believed that there are certain biological reasons for these increases but also suggested that some animals may have moved south from Australian waters. Japan also suggested that the increase in numbers of various large whale species in the Southern Hemisphere may not be helpful to the recovery of blue whales, given interspecific competition. Brazil, supported by Australia did not agree.

[4] Branch, T.A., Matsuoka, K. and Miyashita, T. 2004. Evidence for increases in Antarctic blue whales based on Bayesian modelling. *Mar. Mammal Sci.* 20(4): 726-754.

The Commission noted the Scientific Committee report and endorsed its recommendations.

4.4 Other small stocks – bowhead, right and gray whales

4.4.1 Report of the Scientific Committee

4.4.1.1 SMALL STOCKS OF BOWHEAD WHALES

The Committee received information of a number of analyses on the stock identity, movements and abundance of bowhead whales from the Davis Strait/Baffin Bay and Hudson Bay/Foxe basin regions. There were no reports of any catches in 2004.

4.4.1.2 NORTH ATLANTIC RIGHT WHALES

The Committee has paid particular attention to the status of the North Atlantic right whale in the western North Atlantic in recent years (e.g. see *JCRM* Special Issue 2: *Right Whales: Worldwide Status*). The Committee is extremely concerned about this population, which, whilst probably the only potentially viable population of this species, is in serious danger (*ca* 300 animals). By any management criteria applied by the IWC in terms of either commercial whaling or aboriginal subsistence whaling, there should be no direct anthropogenic removals from this stock.

This year, the Committee once again noted that individuals from this stock are continuing to die or become seriously injured as a result of becoming entangled in fishing gear or being struck by ships. It repeated that it is a matter of absolute urgency that every effort be made to reduce anthropogenic mortality in this population to zero. This is perhaps the only way in which its chances of survival can be directly improved. There is no need to wait for further research before implementing any currently available management actions that can reduce anthropogenic mortalities.

The Committee reviewed progress on a number of research and management recommendations concerning this stock.

4.4.1.3 NORTH PACIFIC RIGHT WHALES

The Committee received reports of sightings of the endangered North Pacific right whales, including news of one biopsy sample and three photo-identification photographs

4.4.1.4 SOUTHERN RIGHT WHALES

The Committee received reports of continuing increases in Southern right whale numbers off South Africa. It was estimated that there are more right whales there now than at any time in the last 150 years. The Committee recommends that the over 30 year monitoring programme be continued, noting its value to conservation and management.

The Committee also received reports of right whales off Brazil and Argentina, and reviewed the report of a photo-identification workshop held in Adelaide, Australia.

4.4.1.5 WESTERN NORTH PACIFIC GRAY WHALES

This is one of the most endangered populations of great whales in the world. It numbers less than 100 animals and there are a number of proposed oil and gas-related projects in and near its only known feeding ground. The Committee held a Workshop in October 2002 to review this further. The Workshop report was published in *J. Cetacean Res. Manage.* 6 (Suppl.). Overall, the Workshop agreed with the conclusions of previous reviews on western gray whales. Specifically, that the population is very small, and suffers from a low number of reproductive females, low calf survival, male-biased sex ratio, dependence upon a restricted feeding area and apparent nutritional stress (as reflected in a large number of skinny whales). Other major potential concerns include behavioural reactions to noise (notably in light of increasing industrial activity in the area) and the threat of an oil spill off Sakhalin which could cover all or part of the Piltun area and thus potentially exclude animals from this feeding ground. The Workshop had noted that assessments of the potential impact of any single threat to the survival and reproduction of western gray whales were insufficient and had strongly recommended that risk assessments consider the cumulative impact of multiple threats (from both natural and anthropogenic sources). Last year, the Committee adopted the Workshop report and endorsed its recommendations, including the research and monitoring plan.

In reviewing progress this year, the Committee noted with great concern that the evidence is compelling that this population is in serious danger of extinction. It reiterated that the population is small (only about 100 whales) and appears to have biological problems (only 23 reproductive females, three or more years calving interval, male biased sex ratio, and apparent low calf survival). Furthermore, there is only a single known coastal feeding habitat (approximately 60km long and 5km wide) used by females and calves which faces an obvious and immediate threat from industrial activities, including noise, vessel traffic and the potential for a catastrophic oil spill. Noting, its similarly strong concerns for North Atlantic right whales, the Committee recommended as a matter of absolute urgency that measures be taken to protect this population and its habitat off Sakhalin Island.

Plans for the Russia-USA research collaboration and national research plans from Russia and Korea were presented. As in previous years, the Committee strongly recommended that the ongoing Russia-USA and Russian and Korean national programmes on western gray whale research and monitoring continue and expand into the future. Results from these programmes will be the only way to monitor and assess the status of this critically endangered population.

The Committee also strongly recommended that all range states develop or expand national monitoring and research programmes on western gray whales. The Committee noted particularly that the precise location and status of the breeding grounds of this highly endangered whale (presumably in Chinese waters) are still unknown.

4.4.2 Commission discussion and action arising

New Zealand welcomed the news that there are more southern right whales now than there have been for the past 150 years but noted that the global population is still only around 10% of its estimated pre-exploitation level. It also noted that all these small stocks were once abundant and suggested that it will be centuries, if ever, before they recover.

Further discussion focused on the western North Pacific stock of gray whales. Noting the concern expressed by the Scientific Committee regarding this stock, the Russian Federation considered that as yet there is no evidence that the oil development programme off Sakhalin Island is having an actual impact on the gray whales. The Republic of Korea shared the Scientific Committee's concern and believed that more studies were needed to assess the impact, if any of the oil industry's activities. It noted the historic and cultural importance of this species to the

Korean peoples and that in 1962, the Korean Government had declared its migration corridor a national treasure. It reported that it had conducted a national census that would complement the work of the Scientific Committee, and stressed the importance of involving range states in work on this stock. The USA, Germany and Italy also expressed concern regarding the status of this stock and welcomed the Scientific Committee's recommendations. Japan considered that the countries in which the headquarters of the major oil companies involved are based should work closely with range states on this issue.

The Commission noted the Scientific Committee report and endorsed its recommendations.

RESOLUTION ON WESTERN NORTH PACIFIC GRAY WHALE

The UK introduced a draft Resolution on western North Pacific gray whales of behalf of the other co-sponsors South Africa, Belgium and Germany. Among other things, the draft Resolution:

(1) endorsed all of the Scientific Committee's conclusions and recommendations;
(2) requested the Secretariat to offer its services and scientific expertise to the organisations concerned with oil and gas development projects and to participate actively in any international panels convened to consider the impacts of these projects on the western gray whale; and
(3) requested all range states to develop, begin or continue scientific research programmes on the migration, distribution, breeding, population assessment and other research of the entire range of this stock.

While the general sentiment of the draft Resolution was supported by all, the Republic of Korea, Norway and Japan questioned whether it was necessary given that it was largely a repeat of the Scientific Committee recommendations. Referring to the third pre-ambular paragraph, the Russian Federation repeated its earlier comments that there is no evidence that oil and gas exploration is having an impact on the population and that this population was under threat of extinction prior to these activities beginning. It proposed some revisions to the text to reflect its view. Japan questioned why the co-sponsors had not consulted with the range states. Iceland objected to the last pre-ambular paragraph referring to IWC as the international recognised body for the conservation of whale stocks and believed this statement to be contrary to UNCLOS.

The UK explained that the key difference between the draft Resolution and the Scientific Committee recommendations was that the former urges governments to involve IWC in the independent work taking place around Sakhalin Island. It could not support the Russian Federation's proposed amendments since these would not reflect the Scientific Committee views, and it believed that it had consulted with range states and invited them to comment on the draft Resolution.

Sensing strong support for the draft Resolution, the Chair requested parties to consult to try to resolve differences. Such consultation took place and a revised draft Resolution was submitted with Germany, Italy, Switzerland and Austria being added to the list of sponsors. The Russian Federation believed that the revised proposal would help it in its discussions with the oil and gas industry and called on range states to participate. It hoped that the draft Resolution could be adopted by consensus. The Republic of Korea associated itself with these remarks and urged members to be cognisant of the sovereign rights of range states. Norway's view on the need for a Resolution remained unchanged, believing it to be superfluous. It indicated it would abstain from any vote. Japan was of a similar view and indicated that it too would abstain. In the end, the revised Resolution (2004-1, see Annex C) was adopted by consensus, noting the views of Norway and Japan.

5. ABORIGINAL SUBSISTENCE WHALING[5]

The meeting of the Aboriginal Subsistence Whaling Sub-committee took place on 14 July chaired by Andrea Nouak (Austria). Delegates from 30 Contracting Governments participated. The Chair of the Scientific Committee's Standing Working Group on the Development of an Aboriginal Whaling Management Procedure (SWG) reported the outcome of the Committee's work and discussions. A summary of the discussions of the Sub-committee is included below. The full Sub-committee report is available as Annex D.

5.1 Aboriginal subsistence whaling procedure

5.1.1 Report of the Aboriginal Subsistence Whaling Sub-committee

5.1.1.1 EASTERN NORTH PACIFIC GRAY WHALES

As anticipated, the Scientific Committee had been able to recommend a *Strike Limit Algorithm* (*SLA*) for eastern North Pacific gray whales to the Commission. This was the second *SLA* that the Scientific Committee has recommended in the development process, the first being that for the Bering-Chukchi-Beaufort stock of bowhead whales at the Annual Meeting in 2002.

The candidate procedures for the gray whale case were tested for a broad range of uncertainty in a variety of factors, including: changes in *MSYR* and *MSYL*; model uncertainty; time dependent changes in carrying capacity, natural mortality and productivity; episodic events; stochasticity; survey bias and variability; survey frequency and errors in the historic catch series. The overall performance of candidate *SLA*s was judged by a combination of an examination of the detailed conservation and need satisfaction statistics for each of the *Evaluation Trials* and *Robustness Trials* and human integration of these results in the context of the relative plausibility each member assigns to the individual trials.

Two procedures, J-B2 and the GUP2 (Grand Unified Procedure) based on J-B2 and D-M2 procedures, had performed equally well in the trials. However, after examination of other features that may be used to separate the two *SLA*s (see Annex D for further details), the Scientific Committee unanimously recommended that the GUP2 *SLA* (hereafter the '*Gray whale SLA*') be forwarded to the Commission. It believes that this *SLA* meets the objectives of the Commission set out in 1994 and represents the best scientific advice that the Committee can offer the Commission with respect to the management of the Eastern North Pacific stock of gray whales.

In making this recommendation, the Scientific Committee had noted the integral importance of *Implementation Review*s to the whole process. These would

[5] For details of the Scientific Committee's deliberation on this item see *J. Cetacean Res. Manage.* 7 (Suppl.).

occur every five years and would normally involve at least reviews of information: (1) required for the *SLA* (i.e. catch data, abundance estimates); and (2) to ascertain if the present situation is as expected and within tested parameter space. In addition, to enable swift reaction to new information that gives rise to serious concern, *Unscheduled Implementation Reviews* can be called. There are a variety of possible outcomes of *Implementation Reviews*, including:

(a) the continuation of use of the *SLA*;
(b) the setting of a zero strike limit;
(c) the running of further simulation trials;
(d) the undertaking of a new census immediately; and
(e) a combination of some of the above.

The Sub-committee endorsed the Scientific Committee's recommendations.

5.1.1.2 GREENLANDIC FISHERIES

The Chair of the Standing Working Group (SWG) had reminded the Sub-committee that an urgent need for a Greenland Research Programme was first identified in 1998, primarily due to the lack of recent abundance estimates and the poor knowledge of stock structure. He had noted that it would be extremely difficult, if not impossible, to develop an *SLA* for the Greenlandic fisheries that would satisfy all of the Commission's objectives without such information. This is particularly important in the light of the Scientific Committee's grave concern at its inability to provide management advice for these fisheries.

In reporting to the Sub-committee, the SWG Chair separated out this item into four main issues: stock structure; abundance estimates; biological data and *SLA* development. With respect to the former, the problem was that although the available information suggested that the animals found off West Greenland did not comprise either separate fin or common minke whale stocks, the identity and size of the complete stocks is unknown. The Scientific Committee had agreed to follow a two-step process to further the essential work needed to provide information suitable for management; namely an initial simulation study to focus appropriate genetic analyses.

Regarding genetic analyses, the Scientific Committee had expressed disappointment at the lack of progress in obtaining genetic samples, even though it is mandatory under local regulations to return a sample from each whale caught. It noted that new procedures are in place but repeated its strong recommendation that samples for genetic analysis be collected from the catch as a matter of very high priority. It urged the Commission to encourage the Government of Denmark and the Greenland Home Rule authorities to assist with logistical and, if necessary, financial support and encouraged Greenlandic scientists to investigate other potential sources of samples. The news that some 50 samples are available from the eastern USA and Canada was welcomed and the Scientific Commission urged that these be analysed.

With respect to abundance estimates, last year the Scientific Committee had strongly recommended that a traditional aerial cue-counting survey be carried out in summer 2003 in Greenland. Unfortunately, for logistical and financial reasons it had not been possible to undertake such a survey, but some valuable experimental work had been carried out in 2003 that had been discussed by the Scientific Committee. Greenlandic scientists had presented a plan for a full aerial photographic survey (not cue-counting) to take place in summer 2004. The Scientific Committee had noted the great need for new abundance estimates and, in order to facilitate presentation of appropriate analyses as quickly as possible, had established an intersessional advisory group. The Chair of the SWG noted that the difficult environmental conditions (notably fog and high winds) in Greenland make the undertaking of successful surveys problematic.

In terms of developing an *SLA*, it was noted that the differences between the relatively 'easy' data-rich cases of the bowhead and gray whales and the data-poor Greenlandic cases, may warrant a different approach to the examination of the trade-off between risk and need satisfaction. The SWG had also considered how best to proceed with the development of one or more *SLA*s given the continuing uncertainties about stock structure, abundance, and mixing in the region. One approach would be to postpone *SLA* development until more and better data become available. The SWG had rejected this approach, instead believing that *SLA* development was a matter of considerable urgency. The SWG therefore intends to develop the best *SLA*(s) it can given the data available, and, noting the potential of the simulation approach to help identify appropriate data collection programmes, it recognised that it might become necessary to improve the *SLA*(s) at future *Implementation Review*s when more information is available. The Scientific Committee had endorsed this approach.

The catch data for 2003 were: 6 landed fin whales (2 males and 4 females), with 3 struck and lost; 178 landed West Greenland common minke whales (58 males, 117 females, 3 unknown sex) and 7 struck and lost; and 13 landed East Greenland common minke whales (1 male, 11 females, and 1 unknown sex). An analysis of recent catch data will be provided to the next Committee meeting.

Other aspects of the Scientific Committee's discussions of the Greenlandic fisheries, including the provision of management advice, are given under Item 5.3.1.3

In the Sub-committee New Zealand stated that it considered the data provision by Greenland unsatisfactory and questioned whether restrictions should be imposed on its catch quotas. It asked Denmark to explain how they intended to remedy this situation. Denmark responded that information on the importance of returning samples has been given to the hunters and that efforts are being made to improve communication. The Greenland Home Rule Government regrets the low number of samples collected and, for the 2004 season, letters and phials have been sent to the municipalities and will be handed out to the hunters when licenses are issued. The UK expressed its concern with this response. It recognised that policing of the hunt is difficult, but stated that the conditions under which aboriginal subsistence whaling in Greenland is allowed are known to the hunters and are included in licences. The UK felt that non-compliance with conditions required more serious action.

The Sub-committee endorsed all recommendations of the Scientific Committee on this item.

5.1.2 Commission discussions and action arising

Discussion in the Commission focused on the Greenlandic fisheries.

Following the discussions in the Aboriginal Subsistence Whaling Sub-committee and the Infractions Sub-committee (see section 18 and Annex I) a statement on the Greenland

Research Programme had been prepared and submitted to plenary by Denmark. In this statement, Greenland pointed to the following:

- that the International Whaling Commission has accepted that the West Greenland need for meat from large whales is 670 tons annually;
- that the current IWC quotas do not meet the accepted need;
- further that the Greenland need for whale meat is supplemented by whale meat from stocks not covered by the IWC;
- that Greenland has regularly submitted substantive information on whaling issues to the Commission for decades;
- that the Greenland Home Rule Government has allocated DKK 1.2 – 1.4 mill in each of the years 2002, 2003 and 2004 to surveys and the development of survey methods;
- that attempts were made to carry out aerial surveys in 2002, but due to bad weather these were not carried out as planned, and furthermore, a camera survey test flying was conducted successfully in 2003 in Iceland;
- that Greenland has collected 301 genetic samples from 1998 to 2003, and that 166 samples collected in West Greenland and 30 collected in East Greenland have been analysed in connection with investigations of stock structure of north Atlantic minke whales;
- that the IWC has supported the Greenland Research Program with a total amount of £69,552 in the years 1999 – 2004 to both feasibility study, biopsy study and satellite telemetry;
- that the Commission has decided not to implement the AWMP until the RMS has been implemented;
- that the Greenland annual harvest of the central North Atlantic minke whales constitutes less than 0.01% of the stock;
- that a harvest of minke whale of West Greenland waters has had a larger proportion of females; and
- that the present Schedule foresee a review if new scientific data become available within the present 5 year period (2003-2007) and if necessary amended on the basis of the advice of the Scientific Committee.

Greenland and Denmark further:

- find that the lack of adequate data on abundance and stock structure of West Greenland minke and fin whales is a matter of concern;
- want to complete the research recommended by the Scientific Committee as soon as possible and to continue to facilitate hunters to collect and submit samples from each whale landed; and
- want the Scientific Committee to further discuss the existing results and to guide future analysis of genetic samples.

The statement further requested the Scientific Committee if possible and in concurrence with its own agenda to:

(1) continue development of and complete an AWMP for Greenland whaling when adequate data become available;
(2) continue cooperation and guidance of Greenland scientific activities;
(3) establish adequate guidelines in relation to analysis of the collected samples; and
(4) continue further dialogue with Greenland scientists in order to ensure that the appropriate research activities are successfully undertaken.

The UK referred to the discussions between Denmark/ Greenland and the UK and New Zealand during the Sub-committee meeting. It urged Greenland to carry on its research programme and to try to address the question of sex bias in the catches. The UK also urged the Scientific Committee to consider urgently the effect of this bias in catches on the population dynamics of the stocks involved and to consider what might be done to recognise the difficulties of hunting in the Arctic. It welcomed Denmark's statement and hoped that work could proceed on this basis. New Zealand, Germany and Australia echoed the UK's remarks.

The Minister of Fisheries and Hunting of the Greenland Home Rule Government stressed that his Government recognizes the need to complete the survey and genetic research required for developing abundance estimates. He reported that Greenland is working hard to fulfil its research programme but sought the Commission's understanding of the difficult conditions under which it must be carried out. He requested that a formal review of aboriginal subsistence whaling in Greenland be kept as planned, i.e. a review at the Annual Meeting in 2007.

Japan commented on the different approach being used to develop *SLA*s for aboriginal subsistence whaling (i.e. stock-specific) compared with that for the RMP (i.e. generic), noting that if applied to the B-C-B Seas stock of bowheads the RMP would not give a catch limit. It did not believe these different approaches to be scientifically justified and considered that double standards were being applied. In response, the USA noted that the approaches to the *SLA* and *CLA* are different because the Commission has given different policy advice for the different types of hunt. The USA considered it inappropriate to apply the *CLA* to a stock subject to subsistence whaling. It further noted that the Scientific Committee has indicated that the bowhead *SLA* will have to be reviewed if new information on stock identity comes to light. The Commission noted this part of the Sub-committee's report and endorsed its recommendations.

5.2 Aboriginal subsistence whaling scheme (AWS)

5.2.1 Report of the Aboriginal Subsistence Whaling Sub-committee

As for the last two years, the Scientific Committee recommended a number of scientific aspects of an eventual AWS[6]. These included strike-limit related issues (block limits, carryover, grace period), survey-related issues (survey/census methodology and design, Committee oversight, data analysis and availability), guidelines for data/sample collection and *Implementation Reviews*. During the Sub-committee, Australia recognised that the focus of discussion was on science, but registered its concern over whaling management regimes that it considered should be given equal attention. The USA stated that they have previously expressed concerns over certain provisions of the AWS and that their reservations should continue to be noted. The Sub-committee endorsed the recommendations of the Scientific Committee.

[6] *Ann. Rep. Int. Whal. Comm.* 2002: 74-5.

5.2.2 Commission discussions and action arising

In the Commission, the USA expressed appreciation for the work of the Scientific Committee on the AWS, but believed that some aspects are not appropriate for the B-C-B Seas stocks of bowhead whales. It noted that the 'grace period' (i.e. a mechanism to deal with a hypothetical situation of no abundance estimates being made available with the specified time frame) does not take into account the difficulties of conducting abundance surveys in the Arctic and in any case is redundant as the Commission can request an *Implementation Review* at any time. It further noted that although it agrees in principle with the concept of block quotas, it would like some flexibility regarding their duration; five years would be a minimum. The USA believed that the current management regime provided in paragraph 13(a) of the Schedule has worked well for over 25 years and that any revised scheme must provide a true improvement over the *status quo*.

The Commission noted this part of the Sub-committee report and endorsed its recommendations.

5.3 Aboriginal subsistence whaling catch limits

5.3.1 Report of the Aboriginal Subsistence Whaling Sub-committee

5.3.1.1 BERING-CHUKCHI-BEAUFORT SEAS STOCK OF BOWHEAD WHALES

The Chair of the SWG had noted that this year, the Scientific Committee undertook an in-depth assessment of the B-C-B bowhead whales. The Committee had agreed that substantial progress has been made in investigating possible stock or population structure among B-C-B bowheads but that there is insufficient information at this stage to fully support or refute the hypothesis of a single stock; in fact it is premature to reject any of the hypotheses, or even to draw conclusions about their relative plausibility. The Committee was pleased to receive information on an extensive research programme to address this issue further. Catch information was provided for 2003 by the USA and the Russian Federation (see Annex D).

In terms of management advice, the Scientific Committee agreed that the *Implementation Review* of bowhead whales, due to begin at the 2006 Annual Meeting in time for the major review of subsistence quotas in 2007, will include stock structure issues as a major component, examining the robustness of the *Bowhead SLA* with respect to plausible stock hypotheses via simulation trials.

The Scientific Committee had also noted:

(1) the continuing increase in the abundance estimates derived from the census under the recent catch limits and record high calf counts;
(2) the spatio-temporal distribution and opportunistic nature of the hunt and the low numbers of whales struck annually in St. Lawrence Island and Chukotka; and
(3) the development of an extensive research programme that will address questions of stock structure and allow the formulation of one or more plausible stock structure hypotheses.

Given these factors, the Committee agreed that the *Bowhead SLA* remains the most appropriate tool for providing management advice for this harvest, at least in the short-term. Consequently the results from the *Bowhead SLA* indicate that no change is needed to the current block quota for 2003-2007.

In the Sub-committee, the USA and the Russian Federation commented on planned co-operative research. Noting the Scientific Committee's recommendation on the need for additional research on the bowhead stock identity issue, the USA expressed its commitment to undertake this research so that when the bowhead quota is next reviewed in 2007, management of the stock will be based upon the best science available at that time. The Russian Federation noted its intent to engage in as much joint research as is possible, although it noted that CITES sample requirements may impose difficulties on what is possible. In this respect, Switzerland drew attention to a Resolution adopted at COP 12 of CITES in Santiago (Chile), aimed at facilitating transboundary movement of sensitive biological samples such as scientific research materials for conservation purposes. It suggested that the CITES Management Authorities should be made aware of this if the need arises.

The Sub-committee endorsed the recommendations of the Scientific Committee.

5.3.1.2 NORTH PACIFIC EASTERN STOCK OF GRAY WHALES

Data on catches and information on calf counts from the northbound migration and the breeding lagoons in Mexico were presented to the Scientific Committee. The Committee was encouraged to hear that calf production remains at the mid-range of pre-1999 levels (after low levels in 1999, 2000, 2001). In 2002, the Scientific Committee had carried out an in-depth assessment of the Eastern North Pacific stock of gray whales and agreed that a take of up to 463 whales per year is sustainable for at least the medium term (~30 years), and is likely to allow the population to remain above *MSYL*. No information was presented this year to change that advice. The Committee was pleased to receive the *Gray Whale SLA*, which could be used in future for providing management advice.

The Sub-committee endorsed the recommendations of the Scientific Committee.

5.3.1.3 MINKE AND FIN WHALE STOCKS OFF WEST GREENLAND

The Chair of the SWG had reported that the minke and fin whale stocks off West Greenland was an important issue in the Scientific Committee's deliberations this year. The Committee has never been able to provide satisfactory management advice for either of these stocks. This reflects the lack of data on stock structure and abundance and is the reason for the Committee to first call for the Greenland Research Programme in 1998. He noted that the Commission's financial contributions to the programme had been aimed at testing the feasibility of large-scale biopsy sampling and satellite telemetry to try to obtain information on abundance and stock structure but that unfortunately both proved unsuccessful.

The Scientific Committee stressed that its inability to provide advice on safe catch limits is a matter of great concern, particularly in the case of fin whales where the best available abundance estimate dates from 1987/88 and is only 1,096 (95% CI 520-2,100) while that for West Greenland minke whales dates from 1993 and is 8,371 (95% CI 2,400-16,900). Obtaining adequate information for management must be seen as very high priority by both the national authorities and the Commission. The Committee urged the Commission to encourage the Government of Denmark and the Greenland Home Rule authorities to provide the necessary logistical and financial support. Without such adequate information, the

Committee will not be able to provide safe management advice in accord with the Commission's management objectives, or develop a reliable *SLA* for many years, with potentially serious consequences for the status of the stocks.

The Scientific Committee recommended that every effort be made to ensure that the number of samples collected from the catch in 2004 is considerably higher than in 2003 and close to 100%. It also recommended strongly that these and all existing samples held in Greenland be analysed as soon as possible in accordance with guidance to be given by the intersessional working group.

The Scientific Committee drew attention to the grace period provision that it had agreed previously in the context of a general aboriginal whaling scheme (although it has not yet been accepted by the Commission) associated with agreed *SLA*s. Under such a provision, catch limits would begin to be phased out 10-14 years after an abundance estimate was last obtained and catches would revert to zero at the end of the five-year period during which the catch limit would have been half the previous block. The Committee has not previously suggested that such a grace period should have started for fin whales. However, it drew attention to the fact that if it had, such a period would now be nearing completion.

The SWG Chair reported that it was with great concern that the Scientific Committee advised the Commission that in the absence of an agreed abundance estimate for fin whales arising out of the 2004 survey, it will likely recommend that the take of fin whales off West Greenland be reduced or eliminated immediately. If, as hoped, an abundance estimate is obtained, the Committee will review this next year in its formulation of management advice.

In the Sub-committee, Denmark explained that the Greenland Home Rule Government gave financial support for survey projects of between DKK 1.2-1.4 million annually for the years 2002-2004, and reported on the number of samples collected and analysed (see Annex D) and on the publication of the results. It noted what it considered to be a disappointingly short discussion of these results in the SWG, but hoped to receive some guidance from the SWG on the best directions for future analyses. Greenland was therefore looking forward to a project to be undertaken this winter in cooperation with the SWG. On the question of reduction of the current quota of fin whales, Greenland suggested that the Scientific Committee is not the right body to decide such a reduction. The Greenland Home Rule Government stated that it intended to increase its efforts in cooperation with the hunters' organisation to gain more samples as recommended.

The UK noted that the Scientific Committee recommendations were in the strongest terms it had seen. The UK felt that the Commission would need to agree to take action on the quota if data were not made available. Australia concurred with the UK and suggested that the Scientific Committee concerns should be reinforced by the Sub-committee.

Argentina, New Zealand and the UK expressed concern that the sex ratio of the Greenland's minke hunt is highly female biased: on average, 72% of all minke whales killed in Greenland since 1986 were female. Denmark explained, as it had on earlier occasions, that sex selection is impossible to enforce in Greenland due to both weather and ocean conditions. New Zealand was concerned that the preferential removal of females could significantly affect the regenerative capacity of the stock and suggested that it would be helpful for Greenland to provide information on the date, location and sex of every whale taken, to show precisely what is going on. New Zealand believed that these issues raise fundamental questions of accountability that go to the centre of the integrity of the legal instrument under which the Commission operates. The UK, supported by Switzerland, remarked that if a degree of sex bias is inevitable, it raised some very important questions about the sustainability of the hunt.

With respect to the female bias in the catch, the SWG Chair clarified that it is common for minke whales to segregate both geographically and temporally by sex in the North Atlantic. The sex bias in the catch is longstanding and earlier attempts to model the animals off West Greenland showed that if the minke whales found there comprised a complete stock they would already have become extinct. The sex bias in the catch probably reflects the sex ratio in the waters there and not any selectivity by whalers (which in any case is not possible). He noted that the Committee was expecting a paper on recent catches (both geographical and temporal by sex) at its next meeting.

Greenland explained that the information on the seasonal distribution of the harvest suggests northward movement in early part of hunting season and a southern movement in the autumn, so that the hunting season, which is in any case short, is even shorter in the northern part of the area of distribution of minke whales in West Greenland. Analysis has not so far shown differential distribution of the two sexes. They suggested that knowledge of this bias is long-standing and not recent. This bias suggests that this is probably a part of a larger stock, whose boundaries are uncertain.

The Sub-committee endorsed the recommendations of the Scientific Committee regarding the minke and fin whale stocks off Greenland.

5.3.1.4 NORTH ATLANTIC HUMPBACK WHALES OFF ST. VINCENT AND THE GRENADINES

The Scientific Committee had agreed that it was most plausible that the animals off St. Vincent and The Grenadines are part of the West Indies breeding population (*ca* 10,750 animals in 1992), although it acknowledged that further data to confirm this are desirable. It repeated its previous recommendations that every effort be made to obtain photographs and genetic samples from animals taken. The Scientific Committee was disappointed not to receive information on whether or not any catches had been taken last year (no scientists from St. Vincent and The Grenadines had been present and no national progress report had been submitted). However, it noted that the genetic analyses of at least three samples from caught animals is being conducted and it was pleased to hear that sightings cruises are taking place in the region.

The Scientific Committee agreed that if the humpback whales are part of the West Indies breeding population, the block catch limit of 20 for the period 2003-2007 will not harm the stock.

In the Sub-committee, the UK did not dispute the Scientific Committee recommendations, but urged the need for further data, since it believed there could be ramifications if the animals off St. Vincent and The Grenadines are not part of the West Indies population. Australia understood that St. Vincent and The Grenadines passed new whaling regulations in December 2003, and asked whether a copy of this legislation had been submitted to the Secretariat as is required, and whether it had been found to be consistent with the draft legislation presented to the IWC. The Chair of the SWG indicated that this matter was usually dealt within in the Infractions Sub-committee, but he would investigate this situation.

5.3.2 Commission discussions and action arising

The Commission noted the Sub-committee's report and endorsed its recommendations. Discussions on specific stocks are summarised in the following sections.

5.3.2.1 BERING-CHUKCHI-BEAUFORT SEAS STOCK OF BOWHEAD WHALES

The USA reported that it had undertaken genetic research in response to the request from the Special Meeting of the Commission in October 2002 that an in-depth assessment of this stock be completed with results available for the 2004 Annual Meeting. The USA noted that the results did reveal genetic differences, but that it is too early to draw conclusions regarding stock identity. It drew attention to the Scientific Committee's view that for the time being it is reasonable to continue to apply the bowhead *SLA*, noted the data showing an increase in abundance of this stock and indicated that it saw no need to modify current management approaches. The USA was, however, committed to carrying out further research on stock identity in time for 2007 as requested by the Scientific Committee.

Japan expressed appreciation for the active discussions in the Scientific Committee and believed that the results from work on this stock should be reflected in management advice from this year onwards. As last year[7] it noted what it believed to be double standards in the approach to management of the bowhead stock using the *SLA* and the *Implementation Simulation Trials* on western North Pacific minke whales using the *CLA*. It called for consistency in approach.

5.3.2.2 NORTH PACIFIC EASTERN STOCK OF GRAY WHALES

There were no comments on this stock.

5.3.2.3 MINKE AND FIN WHALE STOCKS OFF WEST GREENLAND

There were no comments on this stock.

5.3.2.4 NORTH ATLANTIC HUMPBACK WHALES OFF ST. VINCENT AND THE GRENADINES

St. Vincent and The Grenadines indicated that it was unfortunate that it had been unable to attend the Scientific Committee and the Aboriginal Subsistence Whaling Sub-committee meetings. It confirmed that it had submitted a copy of its 2003 whaling regulations to the Secretariat, and it reported that on 29 March 2003 one humpback whale, 39ft in length, had been taken.

5.4 Revision of Schedule paragraph 13

5.4.1 Report of the small working group and proposed Schedule amendment

REPORT OF THE SMALL WORKING GROUP

At the 55th Annual Meeting of the IWC, a Small Group comprising the Russian Federation, Denmark, Australia, the USA and the Secretariat was charged with reviewing of the Schedule paragraph 13, that provides for aboriginal subsistence whaling catch limits, to determine how consistency in approach across all such whaling operations could be achieved and to propose some amendments to the Schedule for review and decision-making at the 56th Annual Meeting of the IWC in 2004.

The Small Group worked intersessionally by e-mail and agreed the following.

All provisions governing aboriginal subsistence whaling operations are understood to be, and should be, included in paragraph 13 of the Schedule.

Should the Commission decide to harmonise the Aboriginal Subsistence Whaling Schedule language, the group recommends considering the creation of one option concerning the prohibition on the taking of calves and whales accompanied by calves. The Schedule has such parts in sub-paragraphs 13 (b) (1) and 13 (b) (2), but not in the sub-paragraphs 13 (b) (3) and 13 (b) (4). A new sub-paragraph 13 (a) (4) could be inserted in the general principles governing this form of whaling, to read as follows: 'It is forbidden to strike, take or kill calves or any whale accompanied by a calf.'

The group agreed that nothing in the Russian Federation's proposals to amend Schedule paragraph 13 was intended to allow for commercialisation of the aboriginal subsistence whaling.

The words 'when the meat and products of such whales are to be used exclusively for local consumption' means that some transaction beyond the aboriginal whaling communities under the current Schedule language are acceptable. The definition of aboriginal 'subsistence use' was adopted by the Cultural Anthropology panel of the IWC Meeting of Experts on Aboriginal/Subsistence Whaling in February 1979 (reported in IWC Special Issue 4, 1982) and provided that:

(1) The personal consumption of whale products for food, fuel, shelter, clothing, tools or transportation by participants in the whale harvest.
(2) The barter, trade or sharing of whale products in their harvested form with relatives of the participants in the harvest, with others in the local community or with persons in locations other than the local community with whom local residents share familial, social, cultural or economic ties. A generalised currency is involved in this barter and trade, but the predominant portion of the products from such whales are ordinarily directly consumed or utilised in their harvested form within the local community.
(3) The making and selling of handicraft articles from whale products, when the whale is harvested for the purposes defined in (1) and (2) above.

It was agreed by the Small Group that aboriginal communities in Chukotka, which have quota to take gray and bowhead whales, have equal rights to other aboriginal communities that have Aboriginal Subsistence Whaling quota to use the meat and products of these whale species.

The Small Group noted that the proposal to delete the words 'whose traditional aboriginal subsistence and cultural needs have been recognised' from Schedule sub-paragraph 13(b) (2) was intended to reflect this equality of rights. Without prejudice to any Party's final position and subject to there being no consequential difficulties, it was agreed that should it be necessary to delete the above words to reflect the equality of rights, this would be justified.

PROPOSED SCHEDULE AMENDMENT

After consultation with the Small Group, the Russian Federation proposed the following amendment with a view to improved harmonisation of the Schedule paragraph 13.

[7] *Ann. Rep. Int. Whaling Comm.* 2003:14.

Amend Schedule paragraph 13 as follows (proposed new text is shown in ***bold italics***; deleted text is in ~~strikeout~~ mode):

III. Capture
Baleen Whale Catch Limits

13 (a) ***(4) It is forbidden to strike, take or kill calves or any whale accompanied by a calf.***

13 (b). Catch limits for aboriginal subsistence whaling are as follows:

(1) The taking of bowhead whales from the Bering-Chukchi-Beaufort Seas stock by aborigines is permitted, but only when the meat and products of such whales are to be used exclusively for local consumption by the aborigines and further provided that:

(i) For the years 2003, 2004, 2005, 2006 and 2007, the number of bowhead whales landed shall not exceed 280. For each of these years the number of bowhead whales struck shall not exceed 67, except that any unused portion of a strike quota from any year (including 15 unused strikes from the 1998 - 2002 quota) shall be carried forward and added to the strike quotas of any subsequent years, provided that no more than 15 strikes shall be added to the strike quota for any one year.

~~(ii) It is forbidden to strike, take or kill calves or any bowhead whale accompanied by a calf.~~

~~(iii)~~ ***(ii)*** This provision shall be reviewed annually by the Commission in the light of the advice of the Scientific Committee.

~~(iv)~~ ***(iii)*** The findings and recommendations of the Scientific Committee's in-depth assessment for 2004 shall be binding on the parties involved and they shall modify the hunt accordingly.

(2) The taking of gray whales from the Eastern stock in the North Pacific is permitted, but only by aborigines or Contracting Government on behalf of aborigines, and then only when the meat and products of such whales are to be used exclusively for local consumption by the aborigines ~~whose traditional aboriginal subsistence and cultural needs have been recognised~~ ***and further provided that:***

(i) For the years 2003, 2004, 2005, 2006 and 2007, the number of gray whales taken in accordance with this sub-paragraph shall not exceed 620, provided that number of gray whales taken in any one of the years 2003, 2004, 2005, 2006 and 2007 shall not exceed 140.

~~(ii) It is forbidden to strike, take or kill calves or any gray whale accompanied by a calf.~~

~~(iii)~~ ***(ii)*** This provision shall be reviewed annually by the Commission in light of the advice of the Scientific Committee.

(3) The taking by aborigines of minke whales from the West Greenland and Central stocks and fin whales from the West Greenland stock is permitted and then only when the meat and products are to be used exclusively for local consumption.

(i) The number of fin whales from the West Greenland stock taken in accordance with this sub-paragraph shall not exceed the limits shown in Table 1.

(ii) The number of minke whales from the Central stock taken in accordance with this sub-paragraph shall not exceed 12 in each of the years 2003, 2004, 2005, 2006 and 2007, except that any unused portion of the quota for each year shall be carried forward from that year and added to the quota of any subsequent years, provided that no more than 3 shall be added to the quota for any one year.

(iii) The number of minke whales struck from the West Greenland stock shall not exceed 175 in each of the years 2003, 2004, 2005, 2006 and 2007, except that any unused portion of the strike quota for each year shall be carried forward from that year and added to the strike quota of any subsequent years, provided that no more than 15 strikes shall be added to the strike quota for any one year. This provision will be reviewed if new scientific data become available within the 5-year period and if necessary amended on the basis of the advice of the Scientific Committee.

(4) For the season 2003-2007 the number of humpback whales to be taken by the Bequians of St. Vincent and The Grenadines shall not exceed 20. The meat and products of such whales are to be used exclusively for local consumption in St. Vincent and The Grenadines. Such whaling must be conducted under formal legislation that accords with the submission of the Government of St. Vincent and The Grenadines (IWC/54/AS 8 rev2). The quota for the seasons 2006 and 2007 shall only become operative after the Commission has received advice from the Scientific Committee that the take of 4 humpback whales for each season is unlikely to endanger the stock.

5.4.2 Report of the Aboriginal Subsistence Whaling Sub-committee

In the Sub-committee, while there did not seem to be problems with the report from the Small Group, some concerns were expressed regarding the Schedule amendment proposed by the Russian Federation.

The UK fully accepted that the rights of Chukotka people should be exactly the same as other indigenous peoples but stressed the need to ensure that for aboriginal subsistence whaling operations, the products are, totally or in large measure, used for the people whose needs have been acknowledged. It therefore suggested that rather than simply deleting the text 'whose traditional aboriginal subsistence and cultural needs have been recognised' it be moved so as to apply equally to all indigenous whaling operations. New Zealand made a similar point. Austria sought clarification as to whether deleting this phrase would mean that all future new applications for aboriginal quotas would no longer need to demonstrate that they fulfil these criteria. Several members commented that the appropriate tests of need would continue to apply and that it is the Commission itself that recognises need when it approves aboriginal subsistence whaling quotas.

Grenada supported the proposed Schedule amendment in as much as it was aimed at producing a more uniform code for subsistence whaling operations, but questioned why St. Vincent and The Grenadines is the only one of those operations managed by IWC for which explicit text is included to effect that its operations must be conducted according to national legislation. On the understanding that all IWC members must enact national laws in accordance with the Convention, Grenada suggested that this reference in paragraph 13(b)4 either be deleted or inserted into the sub-paragraphs relating to other subsistence whaling operations. Japan considered that the proposed new paragraph 13(a)4 should refer to female whales accompanied by calves and, noting its long-standing cultural needs for whales, questioned how cultural needs are defined.

The Sub-committee endorsed the recommendation of the small group that its report and the proposed Schedule amendment be put forward to the Commission in plenary. The Sub-committee Chair recommended that those countries suggesting modifications to the proposed Schedule amendment consult prior to the Plenary.

5.4.3 Commission discussions and action arising

In the Commission, the Russian Federation introduced the report of the Small Group (see section 5.4.1), drawing particular attention to the definition of 'subsistence use', and asked that it be adopted by consensus and included in the Chair's Report of the meeting. It noted that since the meeting of the Aboriginal Subsistence Whaling Sub-committee it had worked with Denmark, St. Vincent and The Grenadines and the USA to address the Sub-committee's comments and with them wished to put forward the following slightly revised proposed Schedule amendment:

With the intention to further harmonise Schedule paragraph 13 it is proposed to amend Schedule paragraph 13 as follows (proposed new text is in ***bold italics***; deleted text is in ~~strikeout~~ mode):

'13.*(a)* ***(4) For aboriginal whaling conducted under subparagraphs (b)(1), (b)(2), and (b)(3) of this paragraph, it is forbidden to strike, take or kill calves or any whale accompanied by a calf. For aboriginal whaling conducted under subparagraphs (b)(4) of this paragraph, it is forbidden to strike, take or kill suckling calves or female whales accompanied by calves.***

(5) All aboriginal whaling shall be conducted under national legislation that accords with this paragraph.

(b) Catch limits for aboriginal subsistence whaling are as follows:

(1) The taking of bowhead whales from the Bering-Chukchi-Beaufort Seas stock by aborigines is permitted, but only when the meat and products of such whales are to be used exclusively for local consumption by the aborigines and further provided that:

(i) For the years 2003, 2004, 2005, 2006 and 2007, the number of bowhead whales landed shall not exceed 280. For each of these years the number of bowhead whales struck shall not exceed 67, except that any unused portion of a strike quota from any year (including 15 unused strikes from the 1998 - 2002 quota) shall be carried forward and added to the strike quotas of any subsequent years, provided that no more than 15 strikes shall be added to the strike quota for any one year.

~~(ii) It is forbidden to strike, take or kill calves or any bowhead whale accompanied by a calf.~~

~~(iii)~~ ***(ii)*** This provision shall be reviewed annually by the Commission in the light of the advice of the Scientific Committee.

~~(iv)~~ ***(iii)*** The findings and recommendations of the Scientific Committee's in-depth assessment for 2004 shall be binding on the parties involved and they shall modify the hunt accordingly.

(2) The taking of gray whales from the Eastern stock in the North Pacific is permitted, but only by aborigines or Contracting Government on behalf of aborigines, and then only when the meat and products of such whales are to be used exclusively for local consumption by the aborigines ~~whose traditional aboriginal subsistence and cultural needs have been recognised~~ ***and further provided that:***

(i) For the years 2003, 2004, 2005, 2006 and 2007, the number of gray whales taken in accordance with this sub-paragraph shall not exceed 620, provided that number of gray whales taken in any one of the years 2003, 2004, 2005, 2006 and 2007 shall not exceed 140.

~~(ii) It is forbidden to strike, take or kill calves or any gray whale accompanied by a calf.~~

~~(iii)~~ ***(ii)*** This provision shall be reviewed annually by the Commission in light of the advice of the Scientific Committee.

(3) The taking by aborigines of minke whales from the West Greenland and Central stocks and fin whales from the West Greenland stock is permitted and then only when the meat and products are to be used exclusively for local consumption.

(i) The number of fin whales from the West Greenland stock taken in accordance with this sub-paragraph shall not exceed the limits shown in Table 1.

(ii) The number of minke whales from the Central stock taken in accordance with this sub-paragraph shall not exceed 12 in each of the years 2003, 2004, 2005, 2006 and 2007, except that any unused portion of the quota for each year shall be carried forward from that year and added to the quota of any subsequent years, provided that no more than 3 shall be added to the quota for any one year.

(iii) The number of minke whales struck from the West Greenland stock shall not exceed 175 in each of the years 2003, 2004, 2005, 2006 and 2007, except that any unused portion of the strike quota for each year shall be carried forward from that year and added to the strike quota of any subsequent years, provided that no more than 15 strikes shall be added to the strike quota for any one year. This provision will be reviewed if new scientific data become available within the 5-year period and if necessary amended on the basis of the advice of the Scientific Committee.

(4) For the seasons 2003-2007 the number of humpback whales to be taken by the Bequians of St. Vincent and The Grenadines shall not exceed 20. The meat and products of such whales are to be used exclusively for local consumption in St. Vincent and The Grenadines. ~~Such whaling must be conducted under formal legislation that accords with the submission of the Government of St. Vincent and The Grenadines (IWC/54/AS 8 rev.2).~~ The quota for the seasons 2006 and 2007 shall only become operative after the Commission has received advice from the Scientific Committee that the take of 4 humpback whales for each season is unlikely to endanger the stock.'

In explaining the changes to its earlier proposal, the Russian Federation noted that since all aboriginal subsistence whaling operations must be conducted under national legislation and since St. Vincent and The Grenadines has fulfilled its obligation to develop such legislation, the text referring to legislation could be deleted from paragraph 13(b)4. It also explained that since the hunters of St. Vincent and The Grenadines are able to distinguish between males and females, the distinction between this hunt and the others regarding the prohibition of taking whales accompanied by calves should be retained. The Russian Federation believed that a fragile balance had been reached and on behalf of the other co-sponsors asked that in addition to the report of the small group, the revised proposed Schedule amendment could also be adopted by consensus.

The Commission adopted both the report of the small group and the revised proposed Schedule amendment by consensus. The Russian Federation thanked all Commissioners for their understanding and acknowledged the work of the small group in coming to this result. It hoped that the Commission could continue to work in such a friendly atmosphere. St. Vincent and The Grenadines echoed these sentiments.

6. REVISED MANAGEMENT SCHEME

6.1 Revised Management Procedure (RMP)[8]

6.1.1 Report of the Scientific Committee

6.1.1.1 GENERAL RMP ISSUES

REVIEW OF THE *IMPLEMENTATION* PROCESS AND LEVELS OF INFORMATION REQUIRED FOR *PRE-IMPLEMENTATION ASSESSMENT*S AND FOR PROCEEDING TO AN *IMPLEMENTATION*

The Scientific Committee reviewed the *Implementation* process[9] in light of its experience with western North Pacific minke whales. The aim was to develop a more streamlined and practical approach that would allow the Committee to provide advice to the Commission in a reasonable timeframe regarding particular implementations of the RMP. The unacceptably long time taken to complete the *Implementation* for western North Pacific common minke whales, particularly in comparison with North Atlantic common minke whales, prompted this work.

The Committee Chair reminded the Commission that unlike the case-specific approach used to develop AWMP *Strike Limit Algorithm*s such as that for the *Gray Whale SLA* (see section 5.1), it had been decided that the RMP would follow a generic approach that should be applicable to all baleen whales; the RMP's *Catch Limit Algorithm* (*CLA*) was thus developed on an assumption of a generic single stock. The most important feature of the

[8] For details of the Scientific Committee's deliberation on this Item see *J. Cetacean Res. Manage.* 7 (Suppl.).

[9] i.e. a process by which the Committee makes recommendations to the Commission concerning catch limits (which may be zero or greater than zero) for a particular species in a region.

Implementation Simulation Trials (*IST*s) is to examine RMP performance in a real multi-stock situation and to decide which variant or variants[10] of the RMP can be recommended to the Commission. In all cases it is the *CLA* that is used to calculate the catch limit. In this respect, the Chair noted that some of the reasons for the lengthy process for western North Pacific whales related to the potential complexity of stock structure and the fact that whaling was taking place in coastal waters during migration. He further noted that it is likely that this type of scenario is one that the Commission will request the Committee to provide management advice on in the future.

The Scientific Committee took considerable time to examine the process in detail. Believing that the RMP represents a major step forward in the provision of safe management advice for natural resources, it wanted to make sure that it had a clear set of guidelines as to how it should be used in real situations. In doing this, the Committee looked at a number of issues surrounding, in particular, questions of plausibility, data requirements and availability, and the balance in the nature of the *IST*s. The Committee was also aware that there is almost a paradox in implementing the RMP in that it is a feedback procedure that is designed to learn more as it progresses through time. However, at the beginning of the process (i.e. before feedback starts) there will be the most uncertainty. One of the major discussions of the Committee was to investigate ways to address this issue which do not compromise the appropriate conservative nature of the RMP and the Commission's objectives.

Given this, the Committee developed technical specifications for the 'Requirements and Guidelines for *Implementations*'[11]. The key elements of the Requirements and Guidelines are given below.

(1) The development of a single structure and timetable to avoid the implementation process taking an extended period of time. The important development is that the *pre-implementation assessment* is the forum for ensuring that sufficient information is available to enter into an *Implementation*, with the expectation that the latter can be completed within two years.

(2) Practical ways to deal with the issues that have caused significant difficulty in the past, including:
   - (i) how to deal with plausibility of alternate hypotheses (on *inter alia* stock structure, historical catch/bycatch, *g*(0) for abundance estimates);
   - (ii) how to assign weights to simulation trials; and
   - (iii) how to interpret trial results.

(3) A way to encourage the provision of information while whaling operations are taking place by giving the Commission an option to initiate the RMP by:
   - (i) using a hybrid variant for an initial period whilst ensuring that the objectives of the RMP (particularly with respect to conservation performance) are still met; and
   - (ii) linking this specifically to a research programme designed to reduce key uncertainties.

[10] i.e. options already included in the RMP specification such as catch cascading or catch capping as well as spatial and temporal considerations.
[11] *J. Cetacean Res. Manage.* 7 (Suppl.): Annex D, Appendix 2.

With respect to (3) above, the Committee Chair noted that the general idea, first raised two years ago but not specified in any detail, is that there may be limited circumstances when it is appropriate to give the Commission an option for a hybrid variant, i.e. one that is tested as a combination of a less conservative variant for an initial period of one or two 5-year blocks (whilst data to reduce specific areas of uncertainty are collected), followed by an assumption of a worst case scenario in which it is assumed the associated research programme designed by the Scientific Committee does not result in a reduction of uncertainty and thus the next block reverts to the more conservative variant. The Committee Chair noted that this latter point, although only one aspect of the overall guidelines, had become the focus of some discussion outside the Committee. He therefore provided the following clarifications:

(1) the possibility of using a hybrid variant can only be considered if it has been thoroughly tested in *Implementation Simulation Trials* and found to have fully acceptable conservation performance under the RMP, both in the short term and the long term;
(2) only RMP variants that perform acceptably or 'borderline' on the 'high' weight trials would be considered as candidates for the less conservative variant;
(3) this option will only be considered if the Scientific Committee believes that a research programme can be designed that has a good chance of allowing the Committee to answer its questions on the plausibility of the hypotheses under dispute;
(4) the associated research programme that will be developed and guided by the Committee must identify expected progress in a manner that will allow the Committee to review annually whether the programme has been adequately followed;
(5) the option of using a hybrid variant can only be used once - it is not possible for it to be used again at the end of the initial period under the guidelines we have proposed;
(6) if the Committee does put forward a hybrid variant to the Commission, it will simply be one of several options, i.e. all of the variants that perform acceptably will be put before the Commission for its consideration.

The Committee noted that although this differs from the general guidelines used last year for the western North Pacific common minke whale trials (where acceptable variants needed to perform acceptably in all high plausibility trials and at least borderline in medium plausibility trials), any hybrid variant that the Committee might recommend under the requirements developed this year must perform to the same agreed level of acceptability.

The Chair noted that the 'Requirements and Guidelines for *Implementation*' developed by the Committee relate to:

(1) the information needed to initiate the *pre-implementation assessment*;
(2) the nature and outcomes from a *pre-implementation assessment*; and
(3) the steps in conducting an *Implementation* and the expected input and outcomes at each stage.

Table 1

Recommended schedule for an *Implementation* and subsequent *Implementation Reviews*.

(1) x+ Annual Meetings		(2) First Intersessional Workshop		(3) First Annual Meeting		(4) Second Intersessional Workshop		(5) Second Annual Meeting
'*Pre-implementation assessment*'	→	Trial structure development	→	Conditioning and final trial structure	→	Review results of final trials	→	Committee recommendations
The *pre-implementation assessment* will take place during one or more Annual Meetings and will focus on the following issues: (1) the establishment of plausible stock hypotheses consistent with the data (taken *inter alia* from an agreed list of archetypes) that are inclusive enough that it is deemed unlikely that the collection of new data during the *Implementation* process would suggest a major novel hypothesis (e.g. a different number of stocks) not already specified in the basic trial structure; (2) examination of available abundance estimates; and (3) information on the geographical and temporal nature of 'likely' whaling operations - taking into account the complexity of the situation with regard to spatio-temporal issues. On the basis of this assessment, the Committee will make a recommendation as to whether or not to formally begin the *Implementation* process.		The primary objective is to develop an appropriate *Implementation Simulation Trials* structure and to specify the associated conditioning so that it can be carried out before the First Annual Meeting. Workshop discussions will include: (1) A final review of the plausible hypotheses taking into account the probable management implications to avoid unnecessary work; (2) An examination of more detailed information on expected operations; (3) The determination of the small geographical areas that will be used in specifying the stock structure hypotheses and operational pattern; (4) The development of (options for) potential *Small Areas* and management variants; (5) The specification of the data and methods for conditioning the trials; (6) Further consideration of experimental ways to distinguish amongst competing stock hypotheses. It is important to note that after this stage: (1) there shall be no changes to the agreed trials structure that implements the agreed plausible hypotheses; (2) no new data will be considered.		The primary objective is to review the results of conditioning and to finalise the *IST*s. This review may include new analyses of data but not new data. The Trials may be changed but not the overall structure. Final *IST*s based on: (1) final consideration of plausibility, including weighting trials in terms of the overall balance of the *IST*s; (2) discussion of what data/research may reduce number of hypotheses; (3) updates to standard data sets (i.e. abundance, catches, bycatches) for use in final trials; (4) specification of operational features and management variants: (5) specification and classification of final trials; (6) develop timetable for remaining work		The primary objective is to review the results of the final trials and develop recommendations for consideration by the full Committee on: (1) management areas; (2) RMP variants (e.g. *Catch-cascading*,*Catch-capping*); (3) associated operational constraints (e.g. temporal restrictions); (4) research needs (either within or outside operations) to narrow range of plausible hypotheses; (5) use of 'a less conservative' variant with appropriate research and associated time period.		The primary objective is to review the results of the Second Intersessional Workshop (including any additional trials) and agree recommendations for *Implementation*. If this includes a recommendation for a 'less conservative' option, integral to this will be an agreed research programme guided and approved by the Committee. A progress report on this programme must be submitted annually to the Scientific Committee.

(9) Annual Meeting		(8) Intersessional Workshop		(7) Annual Meeting		(6) Intervening period
	←		←		←	Data collection: see box 5
Carry out *Implementation Review*. Make recommendations to Commission.		Determine new trials to account for new information (depending on complexity, this may resemble either stage (2) or stage (3)).		Examine new information and determine if this is inside/outside tested parameter space and/or if it has narrowed hypotheses. If yes, need new trials and at least one workshop. If no, straight to *Implementation Review* at Annual Meeting (9).		RMP annotation 9 specifies that an *Implementation Review* should normally be scheduled no later than 5 years since completion of the previous *Implementation (Review)*, but earlier if important new evidence on stock identity, major changes to abundance estimation methodology, etc.

He noted that an *Implementation* will normally be completed two years after the Committee recommends that the *pre-implementation assessment* is complete and the assessment can start. The implementation itself will occur during two intersessional workshops and two Annual Meetings. Table 1 summarises the recommended schedule for an *Implementation* and subsequent *Implementation Reviews*.

The Scientific Committee recommended the adoption of the 'Requirements and Guidelines for *Implementation*'.

OTHER

In response to some questions raised by the Commission in the past concerning the spatial-temporal considerations in the RMP, a possible annotation to the RMP specifications was discussed and drafted by the Committee. It will be discussed and finalised at next year's meeting, then presented to the Commission.

The Committee's Requirements and Guidelines for Conducting Surveys and Analysing Data within the RMP were revised and recommended to the Commission for adoption.

The Norwegian representatives to the Committee formally notified it that Norway intended to develop and propose a change to the *CLA* for minke whales in the North Atlantic, in accordance with the guidelines for such a process given in 1992.[12]

6.1.1.2 PREPARATIONS FOR *IMPLEMENTATION*

NORTH PACIFIC BRYDE'S WHALES

The Committee has made relatively slow progress on completing the *Implementation* for western North Pacific Bryde's whales *inter alia* due to its heavy workload. While noting that it was in the *pre-implementation assessment* stage, the Committee noted the considerable work already undertaken and agreed that it should be possible to move faster towards *Implementation* than would be the case for new situations. For a number of reasons, the Committee did not make as much progress as it had hoped on this issue in Sorrento. In order to ensure progress during the coming year it therefore agreed to hold an intersessional Workshop before the next annual meeting.

NORTH ATLANTIC FIN WHALES

The Committee reviewed the available information in order to determine whether there was sufficient information to warrant the initiation of a *pre-implementation assessment* for North Atlantic fin whales. It agreed that there was and recommended that the Committee initiate the *pre-implementation assessment*, beginning at next year's annual meeting.

6.1.1.3 BYCATCHES OF LARGE WHALES

The RMP estimates a limit for the number of non-natural removals, not simply a catch limit for commercial whaling. It is therefore important to estimate the numbers of whales removed from the population by indirect means including for example bycatches in fishing gear and ship strikes.

The Scientific Committee began to consider this issue in some detail three years ago. It agreed that priority should be given to those areas where the RMP is likely to be implemented - such as the northwestern Pacific and the northeastern Atlantic. Four steps are required:

(1) identification of the relevant fisheries;
(2) description and categorisation of those fisheries to allow a sampling scheme to be devised;
(3) identification of a suitable sampling strategy or strategies; and
(4) design and implementation of the sampling scheme to enable estimation of the total bycatch.

The Committee has reviewed general methods for estimating bycatches. These fall under two headings:

(1) those based on fisheries data and observer programmes; and
(2) those based on genetic data.

The former have been used successfully for several small cetacean populations.

The Committee agreed that independent observer schemes are generally the most reliable means of estimating bycatch rates in a statistically rigorous manner, but that they may not always be practical and will require careful design.

Genetic approaches potentially represent a new way of estimating bycatches. The Committee has agreed that although genetic methods based on market samples may not be the primary approach to estimating bycatch, they could provide useful supplementary data that could not be obtained in another way. The use of market samples to provide absolute estimates should not be ruled out at this stage. However, for its value to be properly assessed will require further developments in sampling design with input from experts with detailed knowledge of market sampling issues. A proposal for a Workshop on that subject was developed and this Workshop will be held immediately prior to the next annual meeting in Ulsan, Korea. The objectives of the Workshop are:

(1) to review available methods that have been used to provide estimates of large cetacean bycatches via market samples, including a consideration of their associated confidence intervals in the context of the RMP;
(2) to provide advice as to whether market-sampling-based methods can be used to reliably estimate bycatch for use in addressing the Commissions objectives regarding total removals over time and, if so, the requirements for such methods.

It was also noted that the Workshop will be interested in the question of markets only insofar as determining whether or not such data can be used to provide reliable estimates of bycatch.

Work to further explore improved bycatch estimation methods for the two approaches noted above is continuing. Improved data reporting for large whale bycatches was also recommended and a pro-forma developed.

6.1.2 Commission discussions

6.1.2.1 GENERAL ISSUES

With respect to the proposed 'Requirements and Guidelines for *Implementation*', Japan expressed strong appreciation to the authors of these guidelines that it believed would help the effective functioning of the *Implementation* process and avoid the long delays that have occurred in the past. It sought confirmation from the Scientific Committee Chair that the approach proposed would not increase risk to stocks. Germany also sought clarification on whether a less conservative approach was now being proposed. In response, the Scientific Committee Chair explained that the approach being proposed is appropriately conservative,

[12] *Rep. Int. Whal. Commn.* 43: 97.

adequately precautionary and consistent with guidance from the Commission in the past. Australia was of the opinion that there are a range of issues related to the RMP that require clarification, e.g. methods for estimating populations, the spatial determination of stocks, harvesting strategies, the establishment of pre-exploitation levels, and whether population models are capable of dealing with shifts in ecosystem regimes. Given the complexity of the issue, the turnover of Commissioners and adherence of new countries to the Convention, Australia proposed that the Chair of the Scientific Committee be invited to make a comprehensive presentation on the RMP and related aspects to the Commission at its 57th Annual Meeting in Ulsan. The UK, Italy and Germany supported Australia's proposal. Iceland appreciated the proposal but believed that it should not delay the Scientific Committee's work. The USA noted that the Committee's proposals are guidelines and as such define a process rather than changing fundamental aspects of the RMP. It hoped that the proposed presentation would not turn into an opportunity to pick apart the RMP. Norway supported adoption of the guidelines and saw no reason to delay their implementation.

6.1.2.2 PREPARATION FOR IMPLEMENTATION

Japan noted that work on western North Pacific Bryde's whales began in 1997 but that there had been delays due to other work of the Committee. It regretted that the *Implementation Simulation Trials* had not been initiated this year.

Iceland expressed concern that limited resources meant that it was not feasible for the Scientific Committee to start two *Implementation*s in the same year resulting in a delay of the completion of the *pre-implementation assessment* for North Atlantic fin whales at next year's meeting.

6.1.2.3 ESTIMATION OF BYCATCH

New Zealand welcomed the Scientific Committee's report on this issue and spoke in support of the proposed workshop, as did the UK, Sweden and Australia. Norway, together with Japan, the Republic of Korea, Dominica and Grenada could not support the Committee's strong recommendation for the workshop, believing it to be outside the Commission's mandate and not plausible. The Republic of Korea noted the difficulty in performing market surveys. Instead, it had made efforts to improve bycatch reporting.

6.1.2.4 NORWAY NOTIFICATION

Norway drew attention to its notification to the Scientific Committee, in accordance with existing guidelines, regarding its intention to develop and propose a change to the *CLA* of the RMP for minke whales in the North Atlantic. It gave two scientific reasons for the proposed changes:

(1) the current *CLA* gives inappropriately small catch limits (compared with, for example, the *SLA* of the AWMP for eastern North Pacific bowhead and gray whales); and
(2) when the RMP was developed in the 1980s, the precautionary principle was interpreted 'one-sidedly'. It was important to ensure against over exploitation of whale resources. Under a future ecosystem-based management, the precautionary principle must be interpreted 'two-sidedly' in the sense that it is important to avoid not only to harvest too many whales, but also not to harvest too few, given the plausible resultant impacts on sustainable fishery yields. The UNWDDS (Johannesburg, 2002) encouraged, with regard to exploitation of living marine resources, the application by 2010 of the ecosystem approach. In this context it is important that the operative management procedure for minke whales is a realistic tool for stabilizing stocks at predetermined levels below carrying capacity.

Japan, noting that it believes the current RMP to be too precautionary, sympathised with Norway and looked forward to hearing of progress in its work. St. Kitts and Nevis and St. Lucia also supported Norway. In contrast, Austria, Germany, Switzerland, Brazil, the UK, New Zealand, Italy, the Netherlands, Mexico and Australia all expressed concern. Some viewed this move by Norway to be shaking the foundations of the RMP and called into question the commitment of members to develop a set of mechanisms to manage exploitation of whale resources. Others believed that with respect to incorporation of an ecosystem approach, Norway would be operating under a speculative hypothesis.

Iceland suggested that the Commission should not be having a political debate on a scientific issue. The USA agreed and clarified that at this point Norway is not asking for an amendment to the RMP but simply notifiying their intention to invoke a scientific process. Monaco and Sweden agreed, although Sweden noted that implementation of an ecosystem approach does not necessarily mean that resources should be harvested.

6.1.3 Action arising

The Commission noted the report and endorsed its recommendations, although with respect to the recommended bycatch workshop, the reservations of Norway, Japan, Republic of Korea, Dominica and Grenada were noted. The proposal for a presentation on the RMP at IWC/57 was also noted.

6.2 Revised Management Scheme (RMS)

6.2.1 Report on intersessional work

At IWC/55 in Berlin, the Commission agreed to Henrik Fischer's proposal to convene a small group of his choosing to explore ways and possibilities of taking the RMS process forward. He subsequently invited Denmark, Iceland, Ireland, Japan, the Netherlands, Spain, Sweden and the USA to take part. All except Ireland were able to accept. Ireland had to decline due to pressures of work associated with the lead-up to Ireland's presidency of the EU starting in January 2004. The Chair's small group (CSG) met at the Secretariat's offices in December 2003 and again in March 2004. Based on these discussions, Henrik Fischer developed his proposals for a way forward on the RMS (see Annex E). This document was circulated in confidence to Commissioners prior to IWC/56 and then presented and discussed at a private meeting of Commissioners in Sorrento on Friday 16 July 2004. A summary of the Chair's proposed RMS 'package' is provided below (note that items indicated with an asterisk require modification of the Schedule).

Elements of a Proposed RMS 'Package'

1. **RMP*:** as agreed by the Scientific Committee and endorsed by the Commission.
2. **A phased-in approach to the resumption of commercial whaling*:** for an initial period (e.g. 5

years after the lifting of the moratorium), commercial whaling would only be allowed in waters under national jurisdiction.

3. **National inspection and observation scheme*:** as proposed by the EDG (generally, observers and inspectors on all boats where practical) with VMS on very small vessels with <24hr trips and one observer per catcher attached to a factory ship.
4. **Additional catch verification to combat IUU whaling and/or unreported bycatches (NOT to monitor trade):**
    - National diagnostic DNA registers and market sampling to agreed standards (with outside review) and a procedure to allow checking of samples against the registers*.
    - Resolution urging countries to institute national legislation prohibiting the import of whale products from non-IWC countries as well as from IWC countries that are non-whaling .
    - Documentation up to port of entry if importation from IWC member *.
5. **Compliance*:** compliance Review Committee with duties as developed by the RMS Expert Drafting Group and agreed by the Commission, and inclusion of Schedule text as proposed in Berlin: *'The Compliance Review Committee reports on infringements and the seriousness of these infringements to the Commission and advises the Commission what actions, if any, to be taken'.*
6. **Mechanism to apportion RMS costs among Contracting Governments*:** costs for national activities should be borne by relevant national governments, while international costs for securing transparency could be allocated in the context of the overall financial contributions scheme.
7. **Measures for the lifting of Paragraph 10(e)*:** modify paragraph 10(e) such that it becomes invalid on a specific day whilst ensuring that any whaling operations are undertaken under the full RMS package (N.B. catches other than zero can only be set for species/areas the Scientific Committee provides advice for under the RMP – currently very few).
8. **Whaling under Special Permit:** recognise that it is a Sovereign right under the Convention but develop a Code of Conduct.
9. **Animal welfare considerations:**
    - Explicit recognition of the issue in the Schedule*: 'The hunting of whales shall be undertaken so that the hunted whale does not experience unnecessary suffering and so that people and property are not exposed to danger.'
    - Resolution focussing on improving techniques, voluntary provision of data to regular scientific workshops and possible co-operative research programmes.

In his document, the Chair noted that the above 'package' of measures includes, in some way, all but two of the elements that have been discussed recently in the context of the RMS. The exceptions are blanket trade restrictions and sanctuaries. While some form of trade restriction might be appropriate in deterring IUU whaling, he believed that a blanket ban on international trade in whale products would be discriminatory against some countries, against principles of free trade and outside the competence of IWC. With respect to sanctuaries, he considered that each should be reviewed on its own conservation and management merits and would therefore be difficult to build into any RMS 'package'.

In the absence of Henrik Fischer, the private meeting of Commissioners to discuss his proposals was chaired by Chris O'Grady, Commissioner for Ireland. Henrik Fischer did, however, submit a written statement to Commissioners (see Annex F).

Chris O'Grady reported the outcome of the private meeting of Commissioners to the plenary meeting. He noted that the objective of the meeting was to present and explain the Chair's proposal and that this had been achieved largely thanks to the presentation of Greg Donovan from the Secretariat. He reported that while some Commissioners expressed difficulties with some elements of the Chair's proposed package, there was general agreement that (1) a package approach would be a useful way forward and (2) that the Chair's document formed a good basis for discussion during the Commission plenary. It had also been agreed that the documents circulated to Commissioners in confidence should be made publicly available in response to concerns expressed by some that the intersessional work had lacked transparency. Some criticism had been levelled at the way involvement in the intersessional work had been restricted to certain countries and there was a call from some Commissioners for wider involvement in any future discussions. Finally Chris O'Grady reported that the Commissioners had agreed that substantive discussion on the Chair's proposed RMS package should be left to the plenary and drew attention to the fact that the Chair's proposal would require considerable intersessional activity prior to IWC/57 next year.

6.2.2 Commission discussions and action arising

Discussions were structured by first inviting an initial exchange of views on Henrik Fischer's proposals, then asking for specific comments on the different proposed RMS package elements and then developing a plan for future work.

6.2.2.1 INITIAL COMMENTS

Denmark agreed fully with the sentiments expressed by Henrik Fischer in his statement to Commissioners (Annex F) regarding the RMS process and the need for its early completion and adoption with as broad a support as possible. It agreed that an RMS is needed for both whale conservation and whale management and considered that the Chair's proposal should be the basis for completing this work, while recognising that obstacles remained to be overcome. However, it stressed that the elements included in the proposed RMS package together represent a delicate balance that had been developed in the spirit of compromise and that this balance should not be compromised. Denmark considered that, as proposed by the Chair, there must be a clear link between the adoption of the RMS and the lifting of the moratorium. It considered that if it is not acknowledged that the objective of an RMS is to conserve whale stocks and to manage whaling in practice, not in theory, using one of the most conservative and precautionary systems ever devised for the setting of quotas of any marine resource (i.e. the RMP), then the rationale for continuing the work would be questionable. Denmark acknowledged that how and when this link is activated is open to discussion, but believed that general opposition to this would de-rail the entire process. It also believed that for the sake of conservation, the moratorium should be lifted and an agreed mechanism implemented to allow for the international management of whaling. It considered that the alternative would be the continued and likely increased level of whaling around the world without agreed international control. It respectfully requested those Contracting Governments that have expressed a concern about linking adoption of the RMS with lifting of the moratorium to explain the nature of their concerns. Denmark believed that without an RMS in place, the Commission would cease to function according to its own Convention, and that many Contracting Governments would be forced to consider seriously the purpose of their continued membership. It therefore urged delegates, as representatives of responsible governments in an international body, to keep the RMS work at the top of the agenda with Henrik Fischer's proposal as the window of opportunity and to provide the resources necessary to have an RMS ready for final consideration at IWC/57 in Ulsan next year.

The USA stated that it wished to make clear that it continues to support the moratorium on commercial whaling, but that it nevertheless remains committed to completing the RMS in a timely fashion. It commended the Chair for his efforts in establishing his small group and thus advancing the RMS process. It considered that without his intervention, it is doubtful whether any progress would have been made since IWC/55. The USA noted that it generally agreed with the Chair's proposed process and saw the need to develop a plan for intersessional work on the RMS. It noted that it could not adopt the proposal in its entirety but was willing to use it as a basis for discussions. It expressed some concerns with the Chair's proposal, particularly with respect to paragraph 10(e) – the moratorium, scientific whaling and cost sharing. It noted the need to include transparency in any future process.

Sweden commented that when it voted in 1982 to introduce the commercial whaling moratorium, it envisaged a 10-year period without whaling in which increased research into the status of whale stocks and the development of an RMS would be carried out. It noted that unfortunately, there had been an increase in whaling outside of IWC control since the moratorium was put into force. Nevertheless, Sweden stressed that it remained committed to completion of the RMS that is now much overdue. It believed that no one, and certainly not the whales, benefit from the present situation and that an RMS is necessary to ensure that whaling will be sustainable and that whale stocks will be restored. Sweden noted that it had therefore accepted gladly the Commission's decision last year to allow Henrik Fischer to establish a small group to facilitate the process towards a new RMS. It noted that in contrast to discussions within the whole Commission that have not always been constructive, its participation in the small group had been a very positive experience, indicating that progress on the RMS is still possible. It hoped that the spirit of co-operation and willingness to seek compromises that had existed among members of the Chair's small group could spread among the whole Commission. Sweden was convinced that the formation of the small group had been the only way forward at the time. However, it now believed that the process should be opened up, provided that this is done in a way that will not reduce efficiency. Sweden supported the Chair's proposal that the RMS should comprise a package, and while his proposals did not fulfil all of Sweden's requirements, it believed that they contain all the essential elements for an RMS and provide a good framework for further development. Completion of an RMS is a prerequisite to Sweden agreeing to lift the moratorium and it is willing to take an active part in further work. The Netherlands, who stressed that they continued to support the existing commercial whaling moratorium made similar comments.

Japan recalled that when the moratorium on commercial whaling was adopted in 1982, it was adopted on the clear condition that by 1990 at the latest, the Commission would undertake a comprehensive assessment of the effect of this decision on whale stocks and consider modification of the provision and the establishment of catch limits other than zero. It noted that this undertaking, which now includes completion of an RMS, remains unfulfilled. It also noted that it has supported early completion of the RMS and considered that while it has made a number of compromises during discussions, some nations opposed to whaling had made excessive requests regarding certain elements of the RMS thus delaying its completion. In view of this stalemate, Japan had supported and appreciated the establishment of the Chair's small group, of which it had been a member. Japan accepted that the Chair's proposed RMS package represents a compromise and noted that because of this, it is not happy will all elements (e.g. the inclusion of special permits). Nevertheless, it remained committed to taking part in future work which public opinion in Japan considered should be concluded by IWC/57 next year. If this was not achieved Japan noted that it would be faced with having to make a difficult decision.

Spain noted that it too remains committed to continuing the process to develop an RMS based on the Chair's proposal. It did, however, have some concerns especially relating to proposals to lifting the moratorium, scientific whaling and cost sharing.

Iceland considered that the Chair's document and proposals showed that more progress has been made in the last 10 months than in the last 10 years and that therefore the proposals should not be dismissed lightly. Although having been part of the small group, Iceland noted that it dislikes strongly various elements of the Chair's proposal, and suggested that this would be the case for all Contracting Governments. However, it stressed that all parties should recognise that there can be no compromise solution on any other basis. Iceland considered that the Chair's proposal represented the only way forward – beginning again from the status of discussions at IWC/55 would dismantle any chance of reaching a conclusion.

Ireland thanked the Chair and his small group, including the Secretariat, for their work. It regretted that it had been unable to join this group due to pressures of other work. Ireland noted that it supports the early adoption of a robust and effective RMS and the package approach proposed by the Chair. It believed the alternative of addressing the elements of an RMS one by one would be a recipe for confusion and continued division within the Commission. Ireland recalled that since 1995, it has been the author of a compromise proposal aimed at unlocking the paralysis within the Commission regarding adoption of an RMS and that it has consistently called for other Parties within the Commission to come forward with an alternative proposal that would meet with more favour than its own. It noted that the Chair's proposal is the response for which it has been waiting, and, like others, considered that it is an important and useful basis for moving forward. Although it supported the package approach, Ireland indicated that it could not, at this stage, accept the package put forward by the Chair, although it was open to further discussions. Its concerns with the package proposed centred on three broad issues:

(1) the link between adoption of an RMS and the lifting of the moratorium;
(2) that whale meat taken within the initial period (e.g. five years) would not be confined to local consumption; and
(3) the proposed handling of whaling under special permit.

Nevertheless, Ireland was optimistic that Henrik Fischer's proposals could be used as a useful basis for breaking the log-jam within the Commission regarding adoption of an RMS. It concluded that the only way forward is further compromise from all members of the Commission. Ireland was prepared to contribute to this compromise.

Like Sweden, Switzerland believed that a management regime is needed to bring existing activities under IWC control. It considered that while more work is needed to reach a compromise solution, real progress had been made since last year and that the Chair's proposal provided a good basis for further work. It also considered that the RMS has to be seen as a package of inter-linking elements. Finland, while still supporting the moratorium, commended the work of the Chair and his small group. It too considered the Chair's proposal as a good basis for further work, although it had difficulties with some of the elements as currently included (e.g. costs and scientific permits). Finland believed that a transparent follow-up is needed with extended participation. Oman associated its position with the view expressed by Ireland and Switzerland.

Dominica considered the work reflected in Henrik Fischer's proposal as a valuable step in the quest to finalise the RMS. Like others, it recognised that further work is needed but urged Commissioners to consider objectively the merits of the package approach proposed so that the RMS can be completed at IWC/57. It stressed the need for all parties to compromise. Antigua and Barbuda made similar remarks and hoped that the Commission could adopted a similar openness in future discussions as that shown by the Chair's small group. The Republic of Guinea, St. Lucia, St. Kitts and Nevis, Grenada, Republic of Korea, Morocco and Benin made similar remarks. St. Lucia noted the significant efforts expended in the formation of the Conservation Committee last year, and urged the proponents of that Committee to commit themselves equally to the completion of the RMS along the lines proposed by the Chair.

Monaco believed that a modern and robust RMS is needed as soon as possible in order to restore credibility to the Commission. Like many others, it commended the work of Henrik Fischer and his small group and considered the proposed package of measures to be a useful basis for the construction of a carefully negotiated agreement.

While appreciating the work of the Chair and his small group, Argentina believed the proposal to be unbalanced since the group included neither representatives of countries from the Southern Hemisphere nor representatives from developing countries. It did not consider the Chair's proposal an appropriate basis for further work.

Germany thanked the Chair, his small group and the Secretariat for their work since the Annual Meeting in Berlin. It noted that it would strive for an RMS based on best practices, drawing on the internationally-accepted high standards in regional fishery organisations. Germany viewed the Chair's proposal as being helpful, but identified concerns related to lifting of the moratorium, catch verification, compliance, costs, special permit whaling and animal welfare (see next section). It considered that sanctuaries should be included as part of the RMS package. It believed that further work should be done in a fully transparent way according to a framework defined clearly by the Commission.

Italy complemented the Chair for his work. It noted that Italy continues to support the moratorium but at the same time believes it very important to make progress on the RMS. While it agreed that the proposed package was a useful tool for making progress, it saw problems with the proposal, particularly in relation to the proposed handling of scientific permits. Like Germany, Italy called for future work to be done in a more transparent way.

South Africa identified itself as a Southern Hemisphere developing country having concerns regarding the welfare of whales in its Exclusive Economic Zone (EEZ) and adjacent Southern Ocean. It noted that it is no longer a whaling country and that it has no intention of ever returning to this practice. It reported that it has benefited greatly from whalewatching, considering this form of non-consumptive use as the preferable means by which its people, and poor communities in particular, gain from the presence of whales along its coast. Indeed it asserted its right to non-consumptive use and its right to have a stake, through the IWC, in the management and conservation of whales on the high seas and in the Southern Oceans in particular. It described some specific concerns with Henrik Fischer's proposal which are given in the section below and associated itself with the remarks of Germany. In general terms, South Africa believed that a greater degree of unanimity and convergence is needed among IWC members in relation to scientific advice (e.g. the RMP). It considered that the divergence evident at each Annual Meeting does not bode well for good management.

Brazil noted that it has participated in good faith in the long and difficult discussions on the RMS and had tried to be open and transparent about its two main interests, i.e.

(1) the construction of an adequate foolproof international inspection and observation scheme to prevent reoccurrence of past abuses and damage caused by legal and illegal whaling operations; and
(2) the proper discussion of an agreement to respect the rights of coastal states to appropriate whale resources in a given ocean basin through non-lethal means.

It reiterated its view that there should be no more private/closed door meetings on the RMS, and that Contracting Governments should be able to be represented at meetings with a full delegation as governments see fit. It stressed that transparency, full accountability and due respect to the rights of states that appropriate whale resources non-lethally are, in its view, integral aspects of RMS negotiations.

New Zealand associated itself with the remarks of Germany and South Africa. While recognising the Chair's efforts to move the RMS process forward, it considered his proposal to be fundamentally flawed and indicated that it would oppose it strongly in its present form for both general policy and legal reasons. It would not compromise on its fundamental views but it was willing to continue negotiations. New Zealand drew attention to the fact that the Commission has presided over the calamitous decline in whale stocks and believed that the negligence of the organisation in this matter is clear and palpable. It was this decline that had led to the 1982 decision to establish a commercial whaling moratorium, thereby taking steps to rebuild public confidence. New Zealand did not believe that the world's public was yet ready for the resumption of commercial whaling, and questioned whether the lessons from past mistakes have been adequately learned and heeded. Regarding the future process for RMS discussions, New Zealand proposed that:

(1) the mandate of any groups established should be to develop proposals without precondition as to their content;
(2) participation in any groups established should be unrestricted; and
(3) meeting schedules and venues should be selected to facilitate the greatest number of participants.

New Zealand considered completion of the RMS to be important, and suggested that this be done prior to the lifting of the moratorium. Furthermore, noting that the Convention is nearly sixty years old and that it is showing signs of weakness that come with age, New Zealand believed it to be badly out of date and in need of revision. Without revision, New Zealand considered that the burdens of administering an RMS would be beyond the capacity of the Commission to handle. In its view, the Convention has serious weaknesses compared with modern treaty instruments. It believed these weaknesses could be remedied, given the collective will to do this, but it was New Zealand's view that commercial whaling could not resume unless and until there are appropriate international enforcement mechanisms and an appropriate international dispute settlement mechanism in place. It advocated revision of the Convention by way of a diplomatic conference to negotiate a Protocol.

The UK while appreciating the efforts of Henrik Fischer and his small group, considered that while the Chair's proposal may form the basis for further discussion, like Germany and New Zealand, it doubted whether the proposal, in its present form, is a package that could form the basis of an agreement. The UK accepted however that work should proceed, believed that it should be done an inclusive a manner as possible, and agreed with New Zealand that there should be no preconditions as to its policy content. It also stressed, that if the Commission is to discuss the RMS in Ulsan with a view to reaching a final conclusion, then any draft package should be agreed as early as possible to allow adequate opportunities for public airing.

Australia associated itself with the comments made by South Africa and Germany. While referring to its well-known position that it would not support the resumption of commercial whaling, Australia noted its legitimate interest in ensuring that, in case this should occur, any management scheme developed has been tested against best and improving practice. It asserted its right to be part of an open and transparent process within the Commission regarding development of an RMS.

Kenya noted that it had never been a whaling nation and had no plans to become one. It believed its policy of the non-consumptive use of wildlife is well known, and in this spirit it favoured the continuation of the moratorium and was opposed to the proposed RMS package, despite its progressive intentions. It associated itself with the views expressed by South Africa and New Zealand.

Portugal associated itself with the views expressed by Germany and Ireland. Austria associated itself with the views of Germany, the UK, New Zealand and others. Peru associated itself with Argentina and Brazil. France indicated that while it is opposed to the resumption of commercial whaling, it recognised the work done by the Chair and his small group and awaited the outcome of future work with interest. Mexico supported the statement of South Africa. It also supported the views expressed by Brazil, Argentina and Peru in the sense that the RMS development process has to be more inclusive of geographic diversity, especially countries in the Southern Hemisphere that oppose whaling and are devoted to the conservation of whales. India wanted RMS development to be expedited, but did not support the suggestion that adoption of an RMS should be linked with lifting of the moratorium.

Dominica noted that last year, the Commission gave the Chair the mandate to form a small group of his choosing to work on a way forward. It therefore regretted the remarks made by some delegations regarding what they considered to be a lack of transparency in the intersessional work since the Annual Meeting in Berlin.

6.2.2.2 DISCUSSION OF PROPOSED RMS PACKAGE ELEMENTS

This section collates comments made on specific elements in the Chair's proposed RMS package. It should be noted that absence of comments by countries neither implies acceptance or rejection of the Chair's proposals.

RMP

The USA believed that the version of the RMS to be included in the Schedule should be that version adopted by the Commission by consensus in 1994 that incorporated the tuning level of 0.72 and a protection level of 0.54 adopted by the Commission in 1992. This is in line with the Chair's proposal. Belgium made similar comments.

The UK noted that the Commission had been advised that the RMS linked to the RMP will provide adequate protection to whale stocks and that catch limits would only be set for whale stocks when scientific advice is given on those catch limits. It therefore viewed with concern Norway's proposal to develop its own version of the RMP (see section 6.1.2).

PHASED-IN APPROACH TO COMMERCIAL WHALING

Brazil viewed this proposal to be one of the most unacceptable provisions within the package. It believed it to be inconsistent with the Convention on the Law of the Sea.

Germany sought clarification as to whether the proposal was to initially restrict whaling to within waters of national jurisdiction (that it understood as being normally a 12 mile limit) or to EEZs (i.e. 200 mile limit). Iceland explained that in fact waters under national jurisdiction extend to 200 miles not 12 miles. The USA confirmed that the Chair's proposal was intended to restrict whaling to within 200 miles initially.

As indicated above, Ireland was concerned that whale meat taken within the initial period (e.g. 5 years) would not be confined to local consumption.

China suggested that domestic legislation needed to be taken into account since its legislation prohibits the taking of whales in national waters.

NATIONAL INSPECTION AND INTERNATIONAL OBSERVATION

Australia, supported by the UK considered that inspection as well as observation should be co-ordinated at the international level by the Commission, and that the proposed provisions for use of vessel monitoring systems (VMS) do not reflect current best practice. Belgium believed that VMS should be compulsory for all whaling vessels.

ADDITIONAL CATCH VERIFICATION MEASURES

Sweden considered additional catch verification measures as a very important part of the RMS, believing it crucial that any systems put in place are transparent and allow for independent checking. It recalled the proposed Schedule amendment it and other countries submitted to the Commission at the Annual Meeting in 2002 and suggested that in the absence of alternative proposals to achieve a similar level of transparency in DNA registers, this remained the best option.

The USA indicated its willingness to support establishment of a DNA register with appropriate IWC oversight and catch documentation based on CITES requirements. It noted its concern regarding the status of current stockpiles of whale meat and other products and how these might be accounted for. Although its preference was that such stockpiles be disposed of by a certain date, it could accept having them entered into a DNA registry.

Belgium considered that the proposed DNA register has to be organised on an international basis for it to be effective. Germany agreed. With respect to catch documentation, Germany considered that it is not satisfactory to simply refer to CITES documentation. It considered that a specific system is needed for IWC and that this would require extensive further work.

Australia did not view the Chair's proposal as being current best practice and suggested that the provisions of CCAMLR should be examined.

COMPLIANCE

Germany considered that provisions should be developed that would equate to the highest standards in other international organisations. Belgium believed that provisions regarding compliance needed to be carefully drafted. New Zealand believed that enforcement could not be left to national procedures as they would not work. Rather, New Zealand proposed that international enforcement mechanisms are necessary.

APPORTIONING COSTS

Germany, Spain, Netherlands, South Africa, Finland the UK, Monaco and the USA expressed concerns regarding the Chair's proposals on how to apportion costs of an RMS among Contracting Governments and considered this to be an area where further work is needed. Germany did not believe that there should be cost sharing between all members and those members participating in whaling. It noted that in regional fisheries organisations, it is common practice that the fishing nations have to pay for international oversight (observers). Germany believed this same principle should apply to IWC. Spain made similar remarks. While the UK accepted that there may be certain central costs resulting from the operation of an RMS which might be appropriate to be borne by IWC's budget as a whole, the UK found it unacceptable that it should be asked to contribute to the costs of enforcement and oversight. The USA, supported by Brazil, believed that the Chair's proposal would result in certain delegations paying a disproportionate share of the total cost of implementing the RMS and called for a more equitable scheme.

Responding to the comparisons made between IWC and other fisheries management organisations in which costs of observers are borne by the fishing nations (user pays), Denmark drew attention to the fact that other fisheries organisations do not require both a national inspector and an international observer to be present on all vessels and neither do they require DNA analyses of every fish caught. Consequently, Denmark believed that a compromise had to be found and indicated its open-mindedness regarding what the solution might be. Iceland associated itself with these comments and added that the fundamental difference between IWC and other fisheries bodies is that the latter do not have some members that wish to prevent others from fishing. It therefore did not consider such comparisons appropriate. China agreed with the remarks of Denmark and Iceland.

South Africa noted that the likelihood of increasing costs to Contracting Governments associated with the proposal is of concern to a country like itself that cannot be a major contributor.

St. Kitts and Nevis indicated that RMS costs must be shared on the basis of equitable principles.

MEASURES FOR THE LIFTING OF PARAGRAPH 10(E)

Denmark, Japan, Norway, St. Lucia, St. Kitts and Nevis, and Grenada all stressed the need to link adoption of an RMS with the lifting of the commercial whaling moratorium. Norway failed to see the logic of discussing the RMS if there is no intention to use it. Japan, St. Kitts and Nevis and Grenada called for simultaneous lifting of the moratorium with adoption of an RMS. (See also Denmark's comments in section 6.2.2.1).

Germany, Brazil, New Zealand, the UK, Australia, Belgium, Monaco, India and Argentina were strongly opposed to linking adoption of an RMS with lifting of the moratorium. Spain and Ireland expressed concern with the Chair's proposal, while the Netherlands called for further elaboration of the phasing in of an RMS package with the phasing out of paragraph 10(e). Brazil believed that discussions on the lifting of paragraph 10(e) should be considered from a geographical as well as time perspective so as to take account of its position on the right of states to use whale resources non-lethally. New Zealand considered that there is no link as a matter of law between adoption of an RMS and lifting of the moratorium - each must be considered on its own merits. It further noted that should the conditions ever be right for lifting the moratorium, this could only happen once an RMS has been adopted. The UK could not see any way in which a package containing both elements will necessarily result in the moratorium only being lifted if an RMS is place without objection. The UK believed that if an objection is raised to the RMS, either at the time of its proposal as a Schedule amendment or subsequently by a government withdrawing from the Convention and re-adhering with a reservation (of which there is a precedent), the RMS should be scrapped and the moratorium immediately put back into force. Australia felt it legitimate for Contracting Governments to have strongly held views on the nature of a robust management procedure should whaling recommence, while maintaining their opposition to commercial whaling and to the lifting of the moratorium. Australia also questioned whether it would be technically possible to achieve the Chair's proposal, i.e. that paragraph 10(e) would become invalid on a specific day while ensuring that any whaling operations are undertaken under the full RMS package. It noted in particular that this proposal puts constraints on the rights of Parties to the Convention (i.e. the right to object) and it was not clear how this could be managed. In this respect, the Secretariat noted that it had not yet done any further work on this aspect as suggested in the Chair's proposal.

WHALING UNDER SPECIAL PERMIT

Several governments believed that Article VIII of the Convention, allowing Contracting Governments to issue permits for the taking of whales for research purposes had been grossly abused in past years and particularly since the moratorium. Germany, Ireland, South Africa, the UK and New Zealand considered that the voluntary code of conduct proposed by the Chair was insufficient. Germany believed that binding rules are needed to regulate whaling under special permits. Ireland's view was that special permit whaling should cease or at the very least be phased-out, if as proposed, commercial whaling is phased-in. It did not believe that public confidence in IWC's ability to manage whaling would be achieved if whaling under special permit continued at the same time as commercial whaling was resumed. The UK found it unacceptable that any RMS could be put in place without some real control and preferably cessation of permit whaling. New Zealand suggested that special permit whaling is practised for improper and non-scientific motives and believed that the issue needs to be addressed in its own right regardless of whether or not an RMS is approved. New Zealand considered it inconceivable that special permit whaling could be allowed to continue and considered Article VIII to be one of the most abused provisions of the Convention and the one at which greatest criticism is levelled. New Zealand considered that Article VIII should be included in its proposals to revise the Convention (see earlier comments).

While it viewed the proposed voluntary code of conduct as a good-faith effort to address this issue, the USA did not believe it goes far enough. The USA reported that whaling under special permit is a major issue for them and stressed the need for substantive progress in terms of halting or deferring scientific whaling, irrespective of rights under Article VIII. It did not see an easy solution, but noted its preparedness to review any creative proposals for moving forward. Sweden associated itself with these remarks.

Spain, Italy and Finland also expressed concern regarding the Chair's proposal. The Netherlands sought further elaboration. Monaco believed that special permit whaling should be brought under full modern control. Belgium considered that quotas for whaling under special permit should be determined by the RMP.

In response to New Zealand's comments, Japan suggested that if New Zealand considers Japan's activities on special permit whaling to be an abuse of Article VIII, then it had the option of bringing a case to the International Court of Justice. It therefore did not consider that preparation of a Protocol is necessary, but viewed it as a delaying tactic. Iceland believed it was clear that to change the Convention along the lines suggested by New Zealand would require more of a consensus than Iceland considered politically possible. It suggested that advocating a revision of the Convention as part of the RMS package is, in effect, rejecting an RMS. Norway supported Iceland's views.

ANIMAL WELFARE CONSIDERATIONS

Noting the importance of animal welfare considerations, Germany indicated that provisions requiring the collection of animal welfare data on a regular basis must be included in the Schedule. It also believed that provisions are needed for killing methods that guarantee instantaneous death or insensibility. Belgium considered that animal welfare considerations should be part of the RMS package. The UK viewed as inadequate the Chair's proposals in this respect, suggested that they add nothing to what is currently included in various Resolutions and in requests for data that are sometimes honoured and sometimes not. The UK believed that if the Commission as a body is to sanction the killing of whales, then it has an ethical duty and moral responsibility to have input into the way whales are killed, e.g. specifying the types of equipment, specifying the weather conditions and sea state under which whales may be taken, and insisting on the collection of data on the efficiency of hunting methods. It recognised that some of these statistics may be difficult to obtain, but nevertheless believed them to be an essential part of an RMS. Without them, the UK considered that there would be no guarantee that whale welfare would be respected.

6.2.2.3 DEVELOPMENT OF A PLAN FOR FURTHER WORK

Denmark, on behalf on the other co-sponsors (Ireland, Iceland, Republic of Korea, Japan, Netherlands, Spain, Sweden, Switzerland and the USA) introduced a draft Resolution to proceed expeditiously towards the completion of both the drafting of text and technical details of the RMS, with the aim of having the results ready for consideration and adoption at IWC/57 (see Table 2). Denmark explained that the proposed Resolution tried to build on the increasing trust and determination of Contracting Governments to overcome the deadlock on the RMS that has plagued the Commission for so long. It stressed that crucial to the building of trust is the recognition of the dual role of the Commission to both conserve whale stocks and to manage whaling. This recognition had been the point of departure for the Chair's initiative in developing his proposed RMS package, and Denmark believed that it should be at the heart of the work proposed in the Resolution. Denmark noted that the co-sponsors also recognised the importance of taking account of the key questions and concerns raised in response to the Chair's proposals (drawing attention to the third preambular paragraph of the Resolution) and in particular the need for full transparency and geographical representation. Assuring delegates that the speedy completion, adoption and implementation of the RMS is an issue on which there is full consensus within the Kingdom of Denmark and noting that the Resolution represented a delicate balance of interest, Denmark urged countries to support the proposed Resolution without amendments.

The USA introduced the proposed intersessional plan of action included with the draft Resolution (see Table 2). It noted that over the course of discussions in Sorrento, a general agreement had emerged that progress on completion of the RMS should be facilitated by intersessional work prior to IWC/57. It also noted the Secretariat's paper (IWC/56/36) summarising the further work required based on the Chair's proposal that demonstrated the need for a mix of activities by some of the Commission's existing sub-groups, such as the RMS Working Group, Scientific Committee and Contributions Task Force, and some new expert groups to advise on technical matters, e.g. in relation to catch verification.

To balance the need for transparency with the need to be able to work efficiently, the plan of action proposed to (1) address the former by reviving the RMS Working Group (that is open to all Contracting Governments and observers) under the Chairmanship of Henrik Fischer and (2) address the latter by establishing a small drafting group under the RMS Working Group. With respect to size, composition and leadership of the small drafting group, the USA proposed that delegations advise the Chair of their interest in serving and that the Commission leave it to the Chair to decide on the group's membership and Chair. It was suggested that the Chair of the Commission should also serve on the small drafting group and that the Secretariat be involved in all groups to provide continuity, expertise, oversight and co-ordination. The USA stressed that the process included in the draft Resolution would require a substantial commitment, i.e. involvement of the Secretariat as described, commitment of delegations to attend intersessional meetings or to provide written views and expansion of the duration of the Annual Meeting so this effort could be accorded the highest priority. And finally it noted that these activities would be counter to prevailing attitudes regarding costs, intersessional work and the priority to be accorded to certain issues.

While thanking Denmark and the USA for their introductions, Australia considered that the proposed Resolution had not, unfortunately, been developed in a way as to be fully inclusive of the interests across the Commission. However, it believed that there was scope to revise the Resolution in a way that could meet the requirements of all parties and suggested that further discussion in plenary be postponed to provide an opportunity for interested governments to discuss possible revisions. The Commission agreed to postpone discussions.

On returning to the issue, Australia introduced a revised draft Resolution (see Table 2), explaining where changes had been made. It believed that the revised proposal, which had been developed by a number of countries, represented a delicate balance and suggested that if it could be adopted by consensus, the Commission would have rebuilt its approach to the RMS.

Dominica indicated that with respect to the last operative paragraph it wished to retain the text in the initial draft, i.e. retaining the words *'with the aim of having the results ready for consideration and adoption at IWC/57'*, and accordingly proposed an amendment to this effect. It felt that the revised text would simply encourage further prolongation of discussions. Palau and Iceland spoke in support of Dominica's proposed amendment and noted that as reference to IWC/57 was included in the intersessional plan of action and in the proposed Terms of Reference for the RMS Working Group, they saw no problem with its inclusion in the Resolution itself. The USA and New Zealand spoke in support of retaining the revised version. The USA expressed concern regarding the inclusion of the term 'adoption' since it believed that adoption of an RMS could not be predetermined.

In view of Dominica's concerns, Australia wondered whether it would be acceptable to include text along the following lines: *'agrees to proceed expeditiously towards the completion of both the drafting of text and technical details of the RMS according to the attached Intersessional Plan of Work with the aim of having the results ready for consideration at IWC/57'*. While Dominica appreciated this suggestion, it could not accept it. As an alternative, Sweden proposed taking text from the Terms of Reference for the RMS Working Group and inserting them in the Resolution, i.e. *'....ready for consideration including for possible adoption at IWC/57'*. Iceland did not believe that Dominica's proposed amendment pre-empted any action by the Commission, but rather simply set an aim. However, if there could not be consensus on Dominica's proposal, then Iceland suggested that Sweden's suggestion provided a way forward. The UK disagreed, believing this to be close to breaching the Commission's Rule of Procedure E.3(b).[13]

On being put to a vote by a show of hands, Dominica's proposed amendment was rejected. Sweden's proposed amendment was accepted by a show of hands. Australia then proposed an amendment to the Resolution as amended by Sweden. It proposed that the third operative paragraph be amended to read *'....with the aim of having the results ready for consideration, including for possible adoption at IWC/57 and/or to identify any outstanding policy and technical issues'*, thus including all the text from the RMS Working Group proposed Terms of Reference. While St. Kitts and Nevis expressed concern that Australia's latest proposal may be in breach of the Rules of Procedure, the Commission adopted by consensus the Resolution as amended by Australia. The amended Resolution (Resolution 2004-6) is provided in Annex C. While accepting that consensus had been reached, Denmark noted its unhappiness at having to explain the outcome to Henrik Fischer. It stressed that the amended Resolution must not lead to a repetition of returning to a square-brackets exercise, and that only fine-tuning of the Chair's proposal was needed, nothing more.

7. WHALE KILLING METHODS AND ASSOCIATED WELFARE ISSUES

In introducing this item, the Chair explained that given the limited time available at IWC/56, the number of sub-groups that had needed to meet and the fact that there had been a 3-day workshop on Whale Killing Methods and Associated Animal Welfare Issues at last year's meeting, the Advisory Committee had agreed not to schedule a meeting of the Working Group in Sorrento. He noted that this agreement was reached on the understanding that:

(a) this issue would be placed early on the plenary agenda and given an adequate time allocation;
(b) Contracting Governments would be asked to provide data and information as requested in a number of Resolutions to the Secretariat for circulation to Contracting Governments well in advance of the plenary; and
(c) the Working Group would meet at IWC/57 in 2005.

[13] Rule of Procedure E.3(b): *Action in pursuance of Article V shall contain the text of the regulations proposed to amend the Schedule. A proposal that does not contain such regulatory text does not constitute an amendment to the Schedule and therefore requires only a simple majority vote. A proposal that does not contain such regulatory text to revise the Schedule but would commit the Commission to amend the Schedule in the future can neither be put to a vote nor adopted.*

Table 2

Draft Resolutions proposed on completion of the RMS.

DRAFT RESOLUTION ON COMPLETION OF THE REVISED MANAGEMENT SCHEME (RMS) Proposed by Denmark *et al.*	REVISED DRAFT RESOLUTION ON COMPLETION OF THE REVISED MANAGEMENT SCHEME (RMS)
Recognising the dual mandate of the IWC for the conservation of whales and the management of whaling according to the 1946 International Convention for the Regulation of Whaling; Noting that on this basis, considerable progress has been made in identifying the major elements necessary to reach broad agreement on the RMS, as reflected in the Chairman's Proposal for a Way Forward on the RMS (Doc IWC/56/26); Taking note of the comments of Contracting Parties on the Chairman's Proposal at the 56th Annual Meeting of the Commission; and Concerned that the failure to reach broad agreement on the RMS in the near future may seriously jeopardise the ability of the IWC to fulfil its responsibility of ensuring the effective conservation of whale stocks and the responsible management of whaling; NOW THEREFORE THE COMMISSION: Commends the efforts of the Chairman in providing the basis for further work and discussion towards the finalisation of the RMS, as reflected in document IWC/56/26; Agrees to re-establish the Working Group on the RMS with a view to holding an intersessional meeting prior to IWC/57, as outlined in the attached Intersessional Plan of Work; and Agrees to proceed expeditiously towards the completion of both the drafting of text and technical details of the RMS according to the attached Intersessional Plan of Work, with the aim of having the results ready for consideration and adoption at IWC/57.	Recognising the dual mandate of the IWC for the conservation of whales and the management of whaling according to the 1946 International Convention for the Regulation of Whaling; Noting that on this basis, considerable progress has been made in identifying the major elements necessary to reach broad agreement on the RMS, as reflected in the Chairman's Proposal for a Way Forward on the RMS (Doc IWC/56/26); Taking note of the comments of Contracting Parties on the Chairman's Proposal at the 56th Annual Meeting of the Commission; and Concerned that the failure to reach broad agreement on the RMS in the near future may seriously jeopardise the ability of the IWC to fulfil its responsibilities; NOW THEREFORE THE COMMISSION: Commends the efforts of the Chairman in providing a basis for further work and discussion towards finalizing the RMS; Agrees to re-establish the Working Group on the RMS with a view to holding an intersessional meeting prior to IWC/57, as outlined in the attached Intersessional Plan of Work; and Agrees to proceed expeditiously towards the completion of both the drafting of text and technical details of the RMS according to the attached Intersessional Plan of Work.
Intersessional plan of work Sufficient material is available from previous efforts, or will have been developed by the end of IWC 56, that the Commission could proceed to develop appropriate draft text for the RMS working on the basis of the Chairman's proposal (IWC/56/26), his statement (IWC/56/26) and the Secretariat's document on further work (IWC/56/36). The goal of this effort is to have a finalized text of an RMS package ready for adoption at IWC/57. The following iterative process would occur to develop such a text over the intersessional period. 1. Commission formally revives the RMS Working Group and agrees to establish a small drafting group under it (see respective terms of reference in Appendices 1 and 2). 2. Secretariat collates and organises available materials. Technical specialist groups identified in IWC/56/36 are set up. 3. Technical specialist groups meet and finish their work before December 2004. 4. Small drafting group meets (one week) in December 2004. 5. Draft text is circulated to delegations for review and comment. Secretariat circulates comments to all delegations and to members of the small drafting group. 6. RMS Working Group convenes in late February – early March 2005 to consider the draft text and submitted comments, and to develop input to the small drafting group for development of the next iteration. 7. The small drafting group meets immediately afterwards to develop the second draft, which the Secretariat circulates to delegates. 8. The RMS Working Group meets for two days during the week prior to the IWC/57 Plenary session to consider the second draft. 9. The results of the RMS Working Group are presented to the Plenary for its consideration at IWC/57.	**Intersessional plan of work** The Chair's Proposal for a way forward (IWC/56/26), supplemented by his statement (IWC/56/26), other comments made at IWC 56 in relation to the Chair's proposal and the Secretariat's document (IWC/56/36), provides a basis for the development of draft text for the RMS, to clarify policy and technical issues and draft text for the RMS. The goal of this effort is to have clarified outstanding policy and technical issues and, as far as possible, have finalized text of an RMS package ready for consideration at IWC/57. The following iterative process would occur to develop such a text over the intersessional period. 1. Commission formally revives the RMS Working Group and agrees to establish a small drafting group under it (see respective terms of reference in Appendices 1 and 2). 2. All Contracting Governments are invited to send comments/ positions on key issues to the RMS Working Group. 3. Secretariat collates and organises available materials. Technical specialist groups meet and finish their work before December 2004. 4. RMS Working Group to provide guidance on major policy issues to small drafting group (before December) 5. Small drafting group meets (one week) in December 2004. 6. Draft text is circulated to delegations for review and comment. Secretariat circulates comments to all delegations and to members of the small drafting group. 7. RMS Working Group convenes in early March 2005 to consider the draft text and submitted comments and to develop input to the small drafting group for development of the next iteration. 8. The small drafting group meets immediately afterwards to develop the second draft, which the Secretariat circulates to delegates. 9. The RMS Working Group meets for two days during the week prior to the IWC/57 Plenary session to consider the second draft. 10. The results of the RMS Working Group are presented to the Plenary for its consideration at IWC/57.
Appendix 1. Terms of Reference for RMS Working Group The RMS Working Group will have the following responsibilities: (3) To complete work on the RMS package, with the goal of having a finalised RMS text ready for adoption at IWC/57. (4) To take account of delegates comments at IWC/56, as well as written submissions from delegates unable to attend the RMS Working Group in person. (5) To provide guidance to, and to review the work of, the Small Drafting Group.	**Appendix 1. Terms of Reference for RMS Working Group** The RMS Working Group will have the following responsibilities: 1. To complete work on the RMS package, with the goal of having a finalised RMS text ready for consideration, including for possible adoption, at IWC/57, and/or to identify any outstanding policy and technical issues. 2. To take account of delegates' comments at IWC/56, as well as written submissions from delegates. 3. To provide guidance to, and to review the work of, the Small Drafting Group. RMS WG to be open to observers.

Cont.

DRAFT RESOLUTION cont.	REVISED DRAFT RESOLUTION cont.
Appendix 2. Terms of Reference for the Small Drafting Group (SDG) Under the auspices of the RMS Working Group, the SDG will have the following responsibilities: 1. To prepare a consolidated draft text for the replacement of parts of Chapters V and VI of the current Schedule. 2. To prepare consolidated draft text on other related issues in the RMS package 3. To utilize the Chair's proposal (IWC/56/26) and his statement (IWC/56/28), as a basis for this work. 4. To rearrange, revise and renumber paragraphs in the draft text for Chapters V and VI as appropriate but not to attempt to merge them with other parts of the Schedule.	**Appendix 2. Terms of Reference for the Small Drafting Group (SDG)** 1. To prepare a consolidated draft text for the replacement of parts of Chapters V and VI of the current Schedule. 2. To prepare consolidated draft text on other related issues in the RMS package. 3. To utilise the Chair's proposal (IWC/56/26) and his statement (IWC/56/28), as a framework for this work. 4. To rearrange, revise and renumber paragraphs in the draft text for Chapters V and VI as appropriate but not to attempt to merge them with other parts of the Schedule. **Representation on SDG and Technical Specialist Groups (TSGs):** Chair to seek expressions of interest to ensure regional and policy diversity in the groups. The SDG and TSGs should include Governments with adequate regional coverage, and adequate coverage of those For/Against/Neutral on the key issues.

The Chair further noted that a request for information went out to all Contracting Governments, since previous Resolutions call not only for the reporting of data on whales killed and improvements to whaling operations but also for all Contracting Governments to (1) provide appropriate technical assistance to reduce unconsciousness and death in all whaling operations; and (2) to provide relevant data from the killing of other large mammals.

7.1 Reporting on data on whales killed and on improving the humaneness of whaling operations

Denmark and the Russian Federation submitted documents in response to the call for information. These are provided in Annex G. The USA gave an oral report which is summarised in Annex G. Japan did not submit data to the Commission, but did provide information on a bilateral basis. It noted that while it considers this issue to be outside the mandate and scope of the Convention, is has nevertheless worked to improve hunting methods and times to death and has participated in workshops and provided information on a voluntary basis. Japan believed that the data on whales killed should be used by those engaged in whaling to improve the hunts, rather than being used in a non-constructive way by those against whaling. It was disappointed that repeated requests for similar data for terrestrial animals had met with little success.

7.2 Commission discussions and action arising

In the Commission, while appreciation was expressed for the reports submitted there were no specific comments on them.

In response to remarks of Japan, the UK recognised that whale killing data have been used in the past to criticise whaling nations, but stressed that this was not its own intention. The UK sees a need to improve efficiency of the hunts and to reduce times to death. While it is satisfied that efforts are being made by all concerned, the UK believes there is a need for continuous improvement. It did not agree with those who consider animal welfare issues to be outside the mandate of the Convention, and again put forward its view that IWC has a moral obligation to ensure minimum suffering of hunted animals.

Germany noted that animal welfare issues are of vital importance to it, and expressed concern regarding:

(1) that current whaling methods do not guarantee instantaneous insensibility or death;
(2) that the data presently collected and submitted to the Commission are of insufficient quality and completeness to allow a fully-informed assessment of the welfare implications of whaling operations; and
(3) that the criteria used to determine death or irreversible insensibility are inadequate.

It regretted that a meeting of the Working Group had not been scheduled in Sorrento, and stressed the need for the group to meet next year. Australia associated itself with Germany's remarks.

The Russian Federation suggested that when countries call for more humane hunts, they should also be prepared to provide help. It noted that following its call for assistance at last year's meeting, only the Netherlands had responded by providing support to a training workshop to be held in Chukotka but also involving the Eskimos of Alaska. It thanked the Netherlands for this support.

Sweden saw the usefulness of comparing data from whaling with data from other hunts, since it believed it important to improve times to death in all hunts. It had therefore tried to gather data on Sweden's moose hunt in which more than 94,000 animals are shot annually. It noted that while no detailed information on times to death are available (there are no official observers of the hunt), information from a questionnaire organised by the hunters association in 1999 had indicated that 75% of animals fell where they were shot and a further 11% fell nearby. Sweden believed that these data suggest that the instantaneous death rate is in the order of 75-86%, i.e. similar to the instantaneous death rate in the Norwegian minke whale hunt. However, Sweden noted that the main concern is the 3.8% (i.e. approximately 3,500 animals) per year that are not found when searched for.

Resolution on whale killing issues

New Zealand introduced a draft Resolution on Whale Killing Issues on behalf of the other co-sponsors (UK, Italy, Germany, Austria, Mexico, South Africa, the Netherlands, Belgium, Brazil, Portugal, Sweden, Spain, India, Argentina, Finland and the USA). It indicated that its own position is that it does not want any whales to be hunted, but that if this is to be done, then those involved should be encouraged to use more humane methods. New Zealand indicated that this is the purpose of the proposed Resolution. It considered that the many variables associated with hunting whales at sea make it difficult to ensure a swift and humane death, as demonstrated by the data submitted over the years to the Working Group. It believed that Article V of the Convention provides the legal mandate to the Commission to address welfare issues, and that it was time that modern animal welfare science should be employed to improve whale hunts. The proposed Resolution:

(1) expressed concern that current whaling methods do not guarantee death without pain, stress or distress; that data presently collected and submitted to the Commission are of insufficient quality or completeness for it to make a fully informed assessment of the welfare implications of all whaling operations; and that the criteria currently used to determine the onset of death or irreversible insensibility are inadequate;
(2) requested the Secretariat to update the data collection form so that Contracting Governments may report data for each whale taken, the killing method used and samples taken;
(3) requested that the Working Group on Whale Killing Methods and Associated Welfare Issues reconvene at IWC/57 to examine methods for reducing struck and lost rates and to consider the welfare implications of methods used to kill whales caught in nets; and
(4) requested the Working Group to advise the Commission on: establishing better criteria for determining the onset of irreversible insensibility and death; methods of improving efficiency of whale killing methods; and reducing times to death and other associated welfare issues.

Germany and India spoke in support of the Resolution.

Norway noted that it takes the issue of animal welfare very seriously, agreed that there is a moral responsibility to do the utmost to reduce animal suffering and referred to the work its scientists have done in this area. However, it had problems with the Resolution proposed and considered it unnecessary in view of the outcome of the 3-day workshop held at IWC/55 last year, of which the draft Resolution made no mention. Regarding the operative paragraphs, Norway knew of no situation in which animals are killed (e.g. euthanasia, pets, stunning of livestock, hunting), where it can be guaranteed that every animal will die without pain, stress or distress, since even with the greatest of precautions, mishaps will occur. While noting that in many countries it is considered acceptable that in industrial slaughter houses instant insensibility should be achieved with one shot for 95% of animals killed, Norway indicated that the reality can be very different, reporting that for pigs, this can be 80% and that for bulls it can be as low as 53%. Referring to Sweden's earlier comments on its moose hunt, it suggested that an animal falling where it is shot is not necessarily an indication of instantaneous death. Its own studies had indicated a rate of 20%. Norway also objected to the statement that *'data presently collected and submitted to the Commission are of insufficient quality or completeness for it to make a fully informed assessment of the welfare implications of all whaling operations'*. It noted that Norway had collected detailed data for over 20 years, and that its research had led to not only its own hunting methods being safer and more efficient but also those of other hunting nations through transfer of expertise and technology. It further noted that it has presented annual reports to the IWC on welfare issues for many years and published many papers in scientific journals. It therefore did not believe that there is any problem with access to Norwegian data. Regarding the concern expressed in the proposed Resolution to the current criteria used to determine the onset of death or irreversible insensibility, Norway agreed that there are problems with these criteria as they are not sufficient to determine the onset of unconsciousness and death exactly, but that provided the data are being collected by competent individuals using the same methods, the criteria can be used to compare different hunting methods and to evaluate the skills of individual whalers. Norway also reported that from neuropathological research it had done, it is evident that the IWC criteria will result in some animals being classified as alive, when in fact they are dead, thus suggesting some overestimation of times to death. Norway therefore considered that its 80% instantaneous death rate should be regarded as a minimum. Finally, Norway requested that the Commission should:

(1) take note of the substantial information provided by Contracting Governments at the Workshop on Whale Killing Methods held in Berlin last year;
(2) encourage Contracting Government to continue the co-operative approach agreed to at the Workshop regarding improvements in data collection and reporting, technical developments of killing methods, and criteria and methods to determine death, both operationally and from post-mortem approaches; and
(3) to employ the best methods available for killing whales, both for purposes of hunting and euthanasia, including stranded whales and whales taken incidentally in fishing operations.

Denmark noted that it supports all efforts to conduct hunting in as humane a way as possible. However, like Norway it thought the proposed Resolution was redundant in view of last year's workshop, and was disappointed that neither the workshop nor past work was mentioned. Japan made similar remarks and asked that the Resolution be withdrawn. Monaco indicated that despite its concern for animal welfare issues, it would have problems in supporting the Resolution as currently proposed as it did not adequately recognise the real efforts and progress made on this issue, particularly by Norway. Iceland associated itself with Norway and appreciated Monaco's remarks. It believed that in some countries, public concern is being directed away from domestic issues to whaling. The Russian Federation associated itself with Monaco and in addition noted that from its perspective, the issue of struck and lost rates is more an issue related to conservation than to humane killing.

The USA noted its support for IWC's long-standing commitment to animal welfare issues, that it has held workshops periodically since 1980 and that it is working closely with others on the criteria used to determine the onset of death or irreversible insensibility.

Sweden was disappointed that it appeared that the Resolution could not be adopted by consensus. Recognising the importance of previous workshops, the Netherlands indicated that it would not have a problem if these were referenced in the Resolution. Austria suggested something similar and the addition of some of Norway's statements. The Chair therefore requested that New Zealand work with Austria, Norway, Sweden and Denmark with a view to revising the proposed Resolution.

On returning to this issue, New Zealand reported that although the cosponsors had consulted widely with others, no agreement had been reached that would enable the Resolution to be passed by consensus. It did, however, propose a minor amendment that would explicitly recognise the significant contribution of Norway in this area.

On being put to a vote, the Resolution was adopted (see Resolution 2004-3, Annex C), there being 29 votes in support of the Resolution and 22 against.

8. SANCTUARIES

8.1 Review of the Southern Ocean Sanctuary

8.1.1 Report of the Scientific Committee[14]

The Committee had been asked by the Commission to review the Southern Ocean Sanctuary (SOS) in 2004 and an intersessional working group had been appointed to develop a proposed framework to carry out the review. In summary, the Committee agreed that:

(1) whales are not effectively protected from whaling in the SOS, because such Sanctuaries apply only to commercial whaling, and because (apart from stocks that migrate to the IOS) whales also migrate outside of the SOS boundaries;
(2) the boundaries of the SOS were appropriately established for some, but not for all stocks; and
(3) it was not possible to completely evaluate the effectiveness of the SOS because the scientific objectives are not clear and are not associated with quantifiable performance measures.

The Committee respectfully requested that the Commission considers clarifying the objective(s) of the SOS in order to allow the Committee to discriminate among designs that would, *inter alia*: protect whales; protect whale species diversity; and increase whaling yields outside the Sanctuary. The Committee also developed a series of recommendations that, once the overall objectives of the SOS have been refined, will allow these objectives to be evaluated, and will facilitate evaluation in future reviews.

8.1.2 Commission discussions and action arising

Norway recalled that it did not take part in the voting procedure when the Southern Ocean Sanctuary was established as there was no clear advice from the Scientific Committee. It admitted that although initially sceptical over the proposal for an independent review of the Southern Ocean Sanctuary, it was pleased with its outcome and was disappointed that this appeared to have been watered down in the Scientific Committee report. Norway considered the Southern Ocean Sanctuary to do little for conservation, believed that it should be abolished and that IWC should remain a resource management organisation. Japan made similar remarks, believing that the external review had confirmed its well-known views. It too called for the sanctuary to be abolished. Believing that the Commission's decisions should be based on science, St. Lucia joined the comments of Norway and Japan. Gabon considered that range states should be consulted in the absence of scientific justification.

Australia considered that the Scientific Committee went through a comprehensive and thorough process in the review and respected its outcomes. It believed that the Committee's conclusions raise issues regarding Marine Protected Areas, scientific concepts and IWC sanctuaries, demonstrating that further work is needed. It accepted the Committee's suggestions and regarding the Committee's request for further guidance, volunteered to take the lead in developing a paper for next year's meeting on this. The UK, Brazil, the USA, Germany, Italy and Belgium associated themselves with Australia's remarks. The USA and Belgium expressed interest in helping to develop a paper. Brazil supported the ongoing process in the Scientific Committee to review sanctuaries and to bring in external expertise. However it stressed that the work should not be misrepresented. The Scientific Committee had not concluded that the Southern Ocean Sanctuary is invalid. Brazil considered sanctuaries to be valid from both scientific and management standpoints, and supports continuation of the existing sanctuaries and creation of new ones. Argentina agreed.

France, recalled that when it initially introduced the proposal in 1994 to create the Southern Ocean Sanctuary, it had focused on two aspects:

(1) protection of all whale species of the Southern Hemisphere from commercial whaling on their feeding grounds, thus supplementing the protection afforded by the Indian Ocean Sanctuary of whales on their reproductive grounds; and
(2) to supplement the management measures envisaged as part of the RMS with zones where whales would be completely protected.

In addition, France had believed that creation of this sanctuary would contribute to the recovery of species seriously depleted by decades of industrial whaling, noting that when proposed, no Southern Hemisphere country had opposed it. It had also taken into account that no aboriginal subsistence whaling was conducted within the proposed sanctuary area. Now that the sanctuary was under review, France thought it worthwhile to revisit the initial justifications in light of events since 1994. France acknowledged the efforts over the years to improve management regimes (from the 'blue whale unit' to the New Management Procedure) but noted that scientific uncertainties remain, and that even with such regimes in place, legal quotas had been set too high and illegal exploitation had not been prevented. It also questioned whether, even if a management procedure could be adopted that took account of past mistakes, successful management could be guaranteed. For this reason, France believed that sanctuaries are needed to ensure long-term conservation, and, even if an RMS were to be adopted, indicated that they would be complementary to exploitation allowed elsewhere.

Addressing the criticism that the Southern Ocean Sanctuary lacked a scientific basis, France recalled that the main reason for its creation was not to meet scientific goals (although it was created on the basis of scientific knowledge) but for conservation purposes. It believed that since 1994, a number of elements had emerged to confirm the need for this long-term measure:

(1) the discovery of new species or sub-species in the sanctuary;
(2) the discovery of important oscillations in population levels creating difficulties in drawing conclusions regarding the capacity of whale populations to recover;
(3) uncertainties regarding the population size of minke whales in the Southern Hemisphere;
(4) other threats to whales, e.g. from pollution, shipping, noise, climate change, incidental catches;

[14] For details of the Scientific Committee's deliberations on this Item see *J. Cetacean Res. Manage.* 7 (Suppl.).

(5) the difficulty of detecting signs of recovery in whale populations other than humpback and southern right whales;
(6) the development of marine protected areas and of international ocean conservation bodies;
(7) the emergence of whalewatching as a form of non-consumptive use of whale resources; and
(8) a collection of international provisions to safeguard the Antarctic.

France believed these elements also justified the creation of new sanctuaries such as those proposed for the South Atlantic and the South Pacific. It recognised that a sanctuary in which only commercial whaling is prohibited does not correspond to the modern concept of protected areas where all aspects of conservation are included, and believed that evolution of the sanctuary concept within IWC should be one of the Commission's next concerns, particularly in view of the discussions this year in the Scientific Committee.

The Commission noted the Scientific Committee report and endorsed its recommendations.

PROPOSED SCHEDULE AMENDMENT

Japan introduced the following proposed Schedule amendment:

> 'Delete paragraph 7(b) and to add the following sub-paragraph (h) to existing paragraph 10:
>
> > (h) Notwithstanding the over provisions of this paragraph, the taking of 2,914 Antarctic minke whales from the Antarctic sector 40°E - 140°W south of 60°S shall be permitted for each of the whaling seasons 2004/05, 2005/06, 2006/07, 2007/08 and 2008/09[1].
>
> * Explanatory note: Adoption of this schedule amendment will require amendment to Table 1 of the Schedule.
>
> [1]This provision shall be modified if the Commission, before the 2008/09 season, adopts other catch limits for this stock based on an agreed management procedure.'

The effect of deleting paragraph 7(b) would be to abolish the Southern Ocean Sanctuary.

In justifying the proposed Antarctic whaling, Japan noted that a comprehensive assessment of the Antarctic minke whale populations completed in 1990 showed that the population was healthy with numbers of around 761,000 whales. It further noted that the RMP was completed in 1992 and in the following year, the continuation of an annual catch limit of 2,049-4,490 Antarctic minke whales for 100 years was calculated using the RMP. Yet despite this, IWC has not yet permitted the resumption of commercial whaling on the grounds that the RMS has not yet been completed. Japan believed this delay to be due to the deliberate stalling by some Contracting Governments and because a three-quarter majority is required to implement an RMS. It reported that its research under special permit in Areas IV and V from the 1987/88 season reveals that Antarctic minke whales are abundant, and that the population level has remained stable. Japan therefore believed that a larger catch limit could be established. It went on to describe proposed pelagic whaling operations and provisions for monitoring and control.

Australia opposed Japan's proposed Schedule amendment. It believed that since the proposed takes of minke whales were not based on an agreed abundance estimate (as there is no currently agreed estimate), the credibility of the proposal was brought into question. At the request of Australia, the Scientific Committee Chair clarified that although Japan's document contained scientific assumptions and calculations based on the RMP and Committee discussions on minke whale abundance, the document had not been submitted to the Scientific Committee as would have been expected. New Zealand's view was that such a proposal should not be submitted before the introduction of an RMS and asked that it be withdrawn. Sweden believed that the Southern Ocean Sanctuary is fully justified and that the moratorium should remain in place until an RMS is agreed. It expressed concern that the Scientific Committee had been by-passed. The UK, Germany, USA, Mexico, Italy, Monaco, France, India, Kenya, Finland, Spain and Chile also spoke against Japan's proposal. The Republic of Korea considered that the discussion on whether or not to continue the Southern Ocean Sanctuary should be postponed to await the outcome of further work. With respect to Japan's proposed takes of whales, the Republic of Korea believed that such a proposal would hinder the development of an RMS and asked that Japan remove this part of its proposal.

St. Kitts and Nevis noted that it had opposed creation of the sanctuary, and that the independent scientific review had discredited it as an effective management tool. Norway supported Japan's proposal to abolish the Southern Ocean Sanctuary, but stressed that it does not intend to harvest whales in the Southern Ocean. Iceland associated itself with Norway's remarks. The Republic of Palau suggested that, coupled with a commercial whaling moratorium that has been in place since 1986, the sanctuary had contributed to the recovery of some species. It therefore believed that the sanctuary had fulfilled its purpose and should be abolished. The Republic of Guinea, Benin and St. Lucia also supported Japan's proposals.

On being put to a vote, the proposed Schedule amendment did not achieve the necessary three-quarter majority for it to be adopted, there being 19 votes in support, 30 against and 2 abstentions.

8.2 Improvements to the review process

8.2.1 Report of the Scientific Committee

The Committee agreed that the inclusion of outside experts in the review process was beneficial and agreed that this should continue. The major improvement to the review process will arise out of the development by the Commission of clearly identified and quantified objectives. The Committee **agreed** to a series of recommendations that, once overall objectives of the SOS have been refined, will allow these objectives to be realised, and will facilitate evaluation in future reviews.

The Committee agreed to the recommendations listed below.

(1) The purpose(s) of the Sanctuaries should be better articulated through a set of refined overall objectives (e.g. preserving species biodiversity; promoting recovery of depleted stocks; increasing whaling yield). In particular, the relationships between the RMP and any Sanctuary programme should be articulated.
(2) Appropriate performance measures for Sanctuaries should be developed. These performance measures should link the objectives of a Sanctuary with field monitoring programmes.
(3) Systematic inventory and research programmess should be established or further developed so as to build the required information base for a Sanctuary

management plan and subsequent monitoring programs.

(4) A Sanctuary management plan should clearly outline the broad strategies and specific actions needed to achieve Sanctuary objectives (e.g. how to protect *x*% of a given feeding area for stock *y*).

(5) A monitoring strategy that measures progress toward achieving the Sanctuary objectives should be undertaken. A key component of this monitoring strategy should be the development of tangible indicators to monitor progress.

(6) Review criteria that reflect the goals and objectives of the Sanctuary (as described above) should be established.

(7) The Sanctuary management plan should be refined periodically to account for ecological, oceanographic and possible other changes in an adaptive fashion.

8.2.2 Commission discussions and action arising

The Commission noted the report and endorsed its recommendations.

8.3 South Pacific Sanctuary

8.3.1 Proposal to amend the Schedule to establish a sanctuary

For the fifth year[15], Australia and New Zealand proposed to establish a South Pacific Sanctuary as follows:

> In accordance with Article V (1)(c) of the Convention, commercial whaling, whether by pelagic operations or from land stations, is prohibited in a region designated as the South Pacific Sanctuary.
>
> This Sanctuary comprises the waters of the Southern Hemisphere enclosed within the following line: starting from the southern coast of Australia at 130°E; thence due south to 40°S; thence due east to 120°W; thence due north to the equator; thence due west to 141°E; thence generally south along the Papua New Guinea – Indonesian maritime boundary to the northern coast of Papua New Guinea at 141°E; thence generally east, south thence west along the coast of Papua New Guinea to the southern coast of Papua New Guinea at 141°E; thence due south to the northern coast of Australia at 141 °E; thence generally east, south thence west along the coast of Australia to the starting point.
>
> This prohibition applies irrespective of the conservation status of baleen or toothed whale stocks in this Sanctuary as may from time to time be determined by the Commission. However, this prohibition shall be reviewed ten years after its initial adoption, and at succeeding ten year intervals and could be revised at such times by the Commission.

New Zealand indicated that it remains convinced that the creation of a South Pacific Sanctuary is vital to ensure the conservation of whales in the region and drew attention to new and continuing efforts of range states and organisations in this regard. It reported that at a national level, the network of domestic sanctuaries continues to grow, with that of New Caledonia being added to the list since the IWC Annual Meeting last year (the others are Australia, New Zealand, Tonga, Vanuatu, Fiji, Niue, American Samoa, Baker Island, Java Island, Cook Islands and French Polynesia). New Zealand indicated that as a result, whales are now protected over approximately 13.5 million square kilometres, and suggested that if this growth of national sanctuaries continues, around 50% of the area proposed as the South Pacific Sanctuary would be covered by them. It stressed that nothing in the proposed Schedule amendment prejudices the sovereign rights of coastal states under the UN Law of the Sea Convention. At a regional level, New Zealand reported that states and territories of the South Pacific have continued to express support under various auspices including the South Pacific Regional Environment Programme and the Pacific Island's Forum) for the sanctuary and for whale conservation. It noted that in March 2004, SPREP hosted a workshop to discuss how a regional initiative for marine mammal conservation under the Convention on Migratory Species could enhance existing national measures. The workshop and agreed that a Memorandum of Understanding under CMS should be drawn up with an vision of *'a Pacific Ocean where populations of marine mammals have recovered to healthy levels of abundance, have recovered to their former distribution, and continue to meet and sustain the cultural aspirations of Pacific peoples'*. Stressing that the overwhelming majority of peoples of the region want a sanctuary to be established, New Zealand urged that the proposed Schedule amendment be adopted.

While recognising that some whales in the South Pacific region appear to be recovering well, Australia indicated that scientific information shows that recovery is uneven. For example, Australia noted that despite 30 years of IWC protection, humpback whales have still not reappeared in significant numbers in their former breeding grounds in Fiji, Vanuatu, Samoa or New Zealand. Australia considered that the best way to secure recovery of all populations is to protect them on their breeding grounds and migration routes – which the South Pacific Sanctuary, combined with the Southern Ocean Sanctuary would afford.

8.3.2 Commission discussions and action arising

On a point of order, Iceland indicated that the legality of the proposal should be addressed before any discussion on the proposal itself. It indicated that it did not believe that the proposal met criteria set out in the Convention, particularly in relation to Article V.2 (a), (b) and (d), i.e. that Schedule amendments be: as necessary to carry out the objectives and purposes of the Schedule; based on scientific findings; and take into consideration the interests of consumers of whale products and the whaling industry. Several countries including Norway, Antigua and Barbuda and Japan took a similar view. Australia and New Zealand noted that the same issue was raised last year and had been settled in favour of the proposal's sponsors by a ruling of the Chair. They did not wish to rehearse previous discussions. Noting the previous debate, the Chair ruled in favour of the sponsors.

The UK, France, Sweden, Brazil, Italy, Kenya, Germany, Peru, Argentina, Mexico, Chile, USA and Monaco spoke in support of the establishment of a South Pacific Sanctuary. The Republic of Palau, Norway, Iceland, Denmark, Antigua and Barbuda, St. Kitts and Nevis, Republic of Guinea, Japan, Tuvalu and St. Lucia spoke against. Some noted that a sanctuary is not currently needed given the existing moratorium and that a scientific need has not been sufficiently demonstrated. Others also believed that the creation of sanctuaries is not consistent with the policy of the sustainable use of marine resources.

The proposed Schedule amendment did not attract the required three-quarter majority when put to a vote. There were 26 votes in support, 21 against and 4 abstentions. Several countries explained their vote. Ireland, who had abstained, indicated that they are supportive of sanctuaries in principle but believed that any new proposals should have maximum consensus and, notably, support from

[15] *Ann. Rep. Int. Whal. Comm.* 1999: 10-11; *Ibid.* 2000: 15-17; *Ibid.* 2001: 33-34; *Ibid.* 2003: 24-26.

whaling nations. Switzerland had been instructed to abstain if the proposal was not supported by all states bounded by the proposed sanctuary.

8.4 South Atlantic Sanctuary

8.4.1 Proposal to amend the Schedule to establish a sanctuary

For the fourth year, Brazil introduced its proposal, co-sponsored by Argentina and others, to create a South Atlantic Whale Sanctuary. The amendment proposed was the same as in previous years, i.e., the inclusion of a new sub-paragraph in Chapter III of the Schedule as follows:

> 'In accordance with Article V(1)(c) of the Convention, commercial whaling, whether by pelagic operations or from land stations, is prohibited in a region designated as the South Atlantic Whale Sanctuary. This Sanctuary comprises the waters of the South Atlantic Ocean enclosed by the following line: starting from the Equator, then generally south following the eastern coastline of South America to the coast of Tierra del Fuego and, starting from a point situated at Lat 55°07,3'S Long 66°25,0'W; thence to the point Lat 55°11,0'S Long 066°04,7'W; thence to the point Lat 55°22,9'S Long 65°43,6'W; thence due South to Parallel 56°22,8'S; thence to the point Lat 56°22,8'S Long 67°16,0'W; thence due South, along the Cape Horn Meridian, to 60°S, where it reaches the boundary of the Southern Ocean Sanctuary; thence due east following the boundaries of this Sanctuary to the point where it reaches the boundary of the Indian Ocean Sanctuary at 40°S; thence due north following the boundary of this Sanctuary until it reaches the coast of South Africa; thence it follows the coastline of Africa to the west and north until it reaches the Equator; thence due west to the coast of Brazil, closing the perimeter at the starting point. This prohibition shall be reviewed twenty years after its initial adoption and at succeeding ten-year intervals, and could be revised at such times by the Commission. Nothing in this sub-paragraph shall prejudice the sovereign rights of coastal states according to, *inter alia*, the United Nations Convention on the Law of the Sea.'

Brazil noted that the proposed sanctuary incorporates environmental, social and scientific issues and takes account of the regional interests of its neighbouring nations. It explained that the objective of the sanctuary is to enhance the global effort to establish Marine Protected Areas for marine mammals and to complement existing IWC whale sanctuaries. It believed the initiative is justified by the recognition that after centuries of exploitation, most whale species have had their numbers drastically reduced and are only now showing signs of recovering from the edge of extinction, with many still at less than 10% of the pre-whaling population. On World Biodiversity Day, Brazil had re-iterated the importance it attaches to the proposal through a letter from its President to the Heads of State of member nations of the IWC and range states of the South Atlantic requesting support for the sanctuary. The many positive responses encouraged Brazil to resubmit the proposal. Brazil noted that since 1987, it has been proud to be among those countries embracing the principle of non-lethal use of whales as a way to profit sustainably from the species inhabiting its waters and reported that whalewatching has been responsible for an important tourism influx to its coastal regions. It believed that creation of the sanctuary would contribute significantly to fostering international co-operative research among developed and developing countries which would in turn help developing countries to realise the potential of cetacean conservation. It therefore hoped that all developing nations that are range states to the proposed sanctuary would support the proposal. With respect to developed nations, Brazil did not understand how some who take progressive stances on environmental issues in other multilateral fora take a position at the IWC that is in contradiction with the interests of biodiversity conservation, particularly when those developed countries raise the argument of economic difficulties when whaling is of no real significance for their economies. Ten years after the entering into force of the Convention on Biological Diversity, Brazil believed that the establishment of the South Atlantic whale sanctuary is a fundamental step forward in ensuring recognition of the rights of developing countries to protect and use their resources under their own management regime. It urged member countries to support the proposal.

Argentina noted that the proposal for a South Atlantic Sanctuary has broad-based support from its nationals. Like Brazil, it has developed whalewatching as a new brand of ecotourism that has contributed to the welfare of local communities by opening up new livelihoods and to an increased interest in marine mammal conservation among the public. Argentina believed that the proposed sanctuary will provide a useful tool in the protection of whales in their breeding and feeding grounds as well as on their migration routes and contribute to: recovery of whale populations; protection of biodiversity; research on depleted stocks and their habitats; the promotion of modern educational activities; and the development of environmentally friendly tourism in the region. It noted the co-operative activities among countries of the region on other environmental and conservation-related issues that could serve as an example to others and urged their support on this issue.

8.4.2 Commission discussions and action arising

Iceland noted that the content of its point of order raised in relation to the proposed South Pacific Sanctuary was also applicable to the proposal for a South Atlantic Sanctuary. However, discussion of the proposal proceeded.

South Africa, Australia, Germany, New Zealand, India, Peru, Mexico, Monaco, UK, USA, Chile and Portugal spoke in support of the proposed sanctuary. A number of them congratulated Brazil and Argentina on the further work done. Iceland, Norway, Japan, Republic of Guinea, Antigua and Barbuda, Gabon and St. Lucia spoke against the proposal, with several countries indicating that they did not consider that sufficient scientific justification for the sanctuary had been presented and noted that there is no consensus among the Scientific Committee. The Republic of Guinea, speaking as a range state for the proposed sanctuary, indicated that its priority is to complete the RMS and was against vast ocean areas being closed to commercial whaling in principle. With Japan, it made reference to the consumption of fisheries resources by whales that it considered to be a problem. On this matter, Brazil could not agree that whales are the real problem in declining fish stocks given the high level of fisheries activities in the South Atlantic. It noted that the proposal for the sanctuary has been submitted to the Scientific Committee and that it is paying due consideration to the further work of the Committee in this area. It considered that the Commission should be honest and fair to the public by stating clearly that there will never be consensus from the Scientific Committee for the creation of new sanctuaries since on this issue, it is as polarised as the Commission itself.

As there was clearly no consensus on the proposal the Chair proceeded to a vote. There were 26 votes in support, 22 against and 4 abstentions. The proposed Schedule amendment to create a South Atlantic Sanctuary was therefore not adopted. Ireland and Switzerland (who both abstained) explained their votes by referring to their statements for the South Pacific Sanctuary proposal. Senegal (who voted against the sanctuary) noted that after many years of being unable to participate actively in the Commission, it had made great efforts to regain its voting rights for this meeting. It wished to inform the Commission that it intended to use its vote responsibly and objectively. It wished to make it clear that Senegal is not participating in IWC as a pro- or anti-whaling nation, but as a fishing nation that believes that all marine resources should be used in a sustainable manner.

9. SOCIO-ECONOMIC IMPLICATIONS AND SMALL-TYPE WHALING

Japan reported on the Third Summit of Japanese Traditional Whaling Regions held in Muroto, Kochi prefecture on 30 May 2004. The Summit adopted the 'Muroto Declaration on Traditional Whaling', that has been endorsed by the Japanese government.

9.1 Proposed Schedule amendment for the taking of minke whales in the North Pacific

9.1.1 Introduction by Japan

Japan introduced its proposal to add the following sub-paragraph (f) under paragraph 10 of the Schedule:

> '(f) Notwithstanding the other provisions of this paragraph, the taking of 150 minke whales from the Okhotsk Sea-West Pacific stock shall be permitted for the whaling season in each of the years 2004, 2005, 2006, 2007 and 2008[1].'
>
> Explanatory note: Adoption of this Schedule amendment will require amendment to Table 1 of the Schedule.
>
> [1]This provision shall be modified if the Commission, before 2008, adopts other catch limits for this stock based on an agreed management procedure.

This proposal was the same as that introduced last year.

As last year, Japan recalled that it had been sixteen years since the imposition of the moratorium on commercial whaling in Japanese coastal waters and that during this time, it had repeatedly requested an interim relief allocation of 50 minke whales to alleviate the hardships of its small-type coastal whaling communities. It noted that even though the Commission had recognised the severe impacts of the moratorium on the four small-type whaling communities and had agreed to work expeditiously to alleviate their distress, the Commission had rejected these requests. In the meantime, Japan believed that whale abundance has increased, while its coastal fisheries have become impoverished, leading to considerable discontent among fishermen over the competition between fisheries and whales.

Japan again noted:

(1) that the Scientific Committee's Comprehensive Assessment of the Okhotsk Sea-West Pacific stock of the North Pacific minke whales completed in 1991 showed the stock to be robust;
(2) that although the RMP had been adopted in 1994 it had not been implemented; and
(3) that effective monitoring and control measures have been discussed exhaustively for over 10 years and have now turned into unrealistically excessive demands designed to delay completion and implementation of the RMS.

Again as last year, Japan indicated that it wished to resume community-based whaling for the sustainable use of robust whale stocks, the management of fishery resources, and the revitalization of the impoverished community-based coastal whaling communities. It noted that all the edible parts of the harvested whales would be used as food, and a substantive part of them distributed primarily among the four community-based coastal whaling communities and neighbouring areas, as well as Kushiro, where a land station would be built. It considered that the resumption of community-based whaling would promote the local processing industries and stimulate distribution of whale products and tourism, leading to more employment opportunities and a stimulation of the local economy. It also believed that the resumption of community-based whaling would reinstate traditional practices associated with sales of whale meat, and revitalize traditional festivals and rituals of the regions.

Japan gave specifics of the proposed whaling operation (whaling ground, season, catch quota) and monitoring and control provisions.

9.1.2 Commission discussions and action arising

Japan clarified that the proposed takes would be from within its own EEZ.

The UK noted that similar requests from Japan have been discussed over the last several years. In addition to the fact that the proposal undermined the commercial whaling moratorium, the UK was also concerned about the status of the 'J' stock. It could not support Japan's proposal. Monaco expressed concern that the proposed takes would be in addition to those taken under special permit and asked whether the meat from these whales could not be used to satisfy the needs of the four Japanese coastal communities. Like the UK, Sweden viewed the proposal as being inconsistent with the moratorium, considered that it by-passed the Scientific Committee and used a number of incorrect assumptions. The USA, Switzerland, India, New Zealand, Germany, Australia endorsed the remarks of the UK, Monaco and Sweden.

The Republic of Korea expressed sympathy with the Japanese communities involved, but asked whether Japan could delay its request to await progress with the RMS.

St. Vincent and The Grenadines, Dominica, Nicaragua, Republic of Guinea, Russian Federation, Senegal, St. Lucia, Benin, Antigua and Barbuda and China understood and recognised the traditional rights and needs of Japan's coastal communities and supported Japan's proposed Schedule amendment. Several of them recognised the proposal's scientific merits. The Republic of Guinea noted that aboriginal subsistence quotas have been granted for the USA and the Russian Federation with respect to bowhead and gray whales and asked for equal treatment for Japan's coastal whaling communities. The Russian Federation believed that Monaco's suggestion to use meat from whales taken under scientific permit to satisfy the needs of the four Japanese coastal communities ignored the 9,000-year cultural tradition of these peoples to harvest their own whales – it is not simply an issue of providing protein. It noted that voting against Japan's proposal would be voting against a long cultural tradition and urged that the matter not be brought to a vote. The Republic of Palau believed the suggestion of the Russian Federation should be pursued and a compromise found. Monaco indicated that it would be willing to support the proposal if Japan agreed to stop its scientific permit takes. Denmark and Côte d'Ivoire also did not see why the matter should be rushed. However, as there was clearly no consensus on this, several countries urged the Chair to proceed to a vote.

Japan noted that it was willing to reduce the proposed take of minke whales from 150 to 100 and to reduce the period of the quota to three years. This amended proposal was put to a vote. There were 19 votes in support, 26 against and one abstention. The proposed Schedule amendment was therefore not adopted.

9.2 Proposed Resolution on Japanese Community-Based Whaling

9.2.1 Introduction by Japan

Stressing that the proposed Resolution was nothing to do with its previous quota request (see section 9.1.1), Japan indicated that it was again seeking the Commission's commitment to work expeditiously to solve the problems caused by the cessation of minke whaling. It noted that the spirit of the Resolution is very similar to that first adopted at the IWC Annual Meeting in Kyoto in 1993. The draft Resolution did, however, refer to the outcome of recent Summits of Japanese Traditional Whaling Communities and Declarations issued from them. The draft Resolution proposed that the Commission (1) reaffirms its commitment to work expeditiously to alleviate the distress caused by the cessation of minke whaling to the communities of Abashiri, Ayukawa, Wadura and Tajii; and (2) welcomes the initiatives of the Government of Japan to resolve this matter.

The proposed Resolution was co-sponsored by Antigua & Barbuda, Belize, Benin, Cote d'Ivoire, Dominica, Gabon, Grenada, Republic of Guinea, Iceland, Mauritania, Mongolia, Nicaragua, Norway, Republic of Palau, Panama, Russian Federation, St. Kitts and Nevis, St. Lucia, St. Vincent and The Grenadines, Solomon Islands, Suriname, and Tuvalu.

9.2.2 Commission discussions and action arising

The UK noted that in discussions under item 9.1, parallels had been drawn between the requests of Japan for a quota of minke whales and the position of aboriginal subsistence whalers. The UK did not believe that this was appropriate, partly because the peoples of the four Japanese communities are reasonably prosperous, but more particularly because the Commission has never received the kind of 'needs' information that could promote discussion on the aboriginal need for these communities. The UK reminded the meeting that after IWC/54 in Shimonoseki, some Contracting Governments suggested that a way forward on Japanese coastal whaling might be for Japan to develop a proposal allowing for non-commercial whaling. No such proposal had been received. Consequently, although the UK was ready to reaffirm sympathy for the position of the communities, it could not endorse the Resolution as Japan had not actually taken the necessary initiatives. New Zealand and Germany endorsed these comments.

The USA indicated that it could not adopt the Resolution as written, and proposed that the operative paragraphs be revised to read: (1) reaffirms its commitment to work expeditiously to alleviate the continued difficulties caused by the cessation of minke whaling to the communities of Abashiri, Ayukawa, Wadura and Tajii; and (2) encourages IWC members to co-operate towards a Resolution of this matter. Japan thanked the USA for its proposal and indicated it could accept the revisions.

The Chair asked if the Resolution could be adopted by consensus. Sweden explained that it could support the Resolution as revised by the USA on the understanding that the intention was 'to finish the RMS in order to be able to initiate an agreed process for setting possible quotas that might alleviate the continued difficulties caused by the cessation of minke whaling….'. It stressed that it did not seek further revision of the Resolution.

The Resolution, revised as proposed by the USA, was then adopted by consensus (Resolution 2004-2, Annex C).

9.3 Proposed Schedule amendment for the taking of Bryde's whales from the Western Stock of the North Pacific

9.3.1 Introduction by Japan

As last year, Japan introduced a proposed Schedule amendment to add the following sub-paragraph (g) under paragraph 10:

> (g) Notwithstanding the other provisions of this paragraph, the taking of 150 Bryde's whales from the Western Stock of the North Pacific shall be permitted for the whaling season in each of the years 2004, 2005, 2006, 2007 and 2008[1]."
>
> Explanatory note: Adoption of this Schedule amendment will require amendment to Table 2 of the Schedule.
>
> [1]This provision shall be modified if the Commission, before 2008, adopts other catch limits for this stock based on an agreed management procedure.

Explaining the rationale for its proposal, Japan again noted that the western North Pacific stock of Bryde's whale was classified as an initial management stock (IMS) or a sustained management stock (SMS) when the moratorium was placed on commercial whaling and that present abundance is estimated at 23,751, according to the Scientific Committee's Comprehensive Assessment completed in 1996. It considered the stock to be very robust. As with its proposal relating to minke whales discussed under section 9.1, Japan referred to the fact that the RMP has been adopted but not implemented and that an RMS has still not been agreed despite discussions over many years. It again noted that work on the development of *Implementation Simulation Trials* has made little progress within the Scientific Committee. Nevertheless, by applying the RMP together with an appropriate monitoring and control regime (which it described), Japan believed that sustainable whaling on this stock of Bryde's whales could be achieved and the impoverished coastal communities revitalised as a result.

9.3.2 Commission discussions and action arising

Nicaragua supported Japan's proposal. Sweden referred to its remarks made under section 9.1 and indicated that they were also applicable to this request. It further noted that work on the *Implementation Simulation Trials* for this stock of Bryde's whales has only just begun. Switzerland agreed with Sweden, emphasising that the moratorium is still in place.

On being put to a vote, Japan's proposed Schedule amendment failed to achieve the necessary three-quarter majority, there being 22 votes in support, 29 against and 2 abstentions.

10. SCIENTIFIC PERMITS

Japan gave a short PowerPoint presentation on its JARPA and JARPN II programmes.

10.1 Report of the Scientific Committee[16]

10.1.1 Improvements to review procedures

Last year, the Committee had noted that the existing guidelines, which had developed over a number of years, inevitably include some duplication and overlap within the broad headings used. With the aim of providing a proposal to the Commission on restructuring the guidelines, it agreed to revisit this issue in a year in which there is no major new scientific permit proposal to review. Although the Committee considered a number of options this year, there was no consensus to change the current procedures.

10.1.2 Review results from existing permits

JAPAN: SOUTHERN HEMISPHERE (JARPA)

The Committee received a number of reports of work undertaken as part of the recent field season of JARPA as well as documents using some or all of the JARPA data collected thus far. These were considered where relevant to the main Scientific Committee agenda.

JAPAN: NORTH PACIFIC (JARPNII)

The Committee reviewed the results of the second full year of the JARPN II programme reviewed last year[17]. A total of 150 common minke, 50 Bryde's, 50 sei and 10 sperm whales were taken. There was considerable diasagreement over the value and conclusions that could be drawn over the two-year feasibility study (and see section 10.1.3 below).

ICELAND: NORTH ATLANTIC

Most of the discussion at the 2003 meeting centred on the proposal for a two-year feasibility study in Icelandic waters involving the taking of 100 common minke whales, 100 fin whales and 50 sei whales. The stated goal was to improve understanding of the biology and feeding ecology of important cetacean species in Icelandic waters for better management of living resources based on an ecosystem approach. It includes multiple specific objectives with different priorities for the different species. For common minke whales the primary specific objective is to increase the knowledge of the species' feeding ecology in Icelandic waters. For fin and sei whales the primary specific objective is the study of biological parameters during the apparent increase in population size in recent decades. These objectives are the basis for the proposed sample sizes. Other research objectives include studies of population structure, pollutants, parasites and pathogens, and the applicability of non-lethal methods. There had been considerable disagreement within the Committee over most aspects of this research programme, including objectives, methodology, sample sizes, likelihood of success, effect on stocks and the amount and quality of data that could be obtained using non-lethal research techniques.

In 2003, a total of 37 common minke whales had been taken. The Committee briefly considered the preliminary results of analyses presented. It noted that no permits had been issued for fin and sei whales which had been part of the proposal it had reviewed last year.

10.1.3 Review of new or continuing proposals

JAPAN: SOUTHERN HEMISPHERE

The Committee briefly discussed the JARPA proposal. This was the final year of a 16-year programme. Progress had been fully reviewed in 1997[18]. The Committee agreed that it will undertake a full review of the JARPA programme when the complete set of results are available following the completion of the 16-year programme, i.e. some time after the 2005 annual meeting of the Committee.

JAPAN: JARPN II

Most of the discussion at this year's meeting centred on the proposal for a JARPN II programme. The stated goals (to obtain information to contribute to the sustainable use of marine living resources in the western North Pacific via sub-projects on feeding ecology and ecosystems; monitoring of environmental pollutants in cetaceans and the marine ecosystem; further elucidation of stock structure) remain unchanged. A total of 220 common minke whales (100 from the offshore survey and 120 from the coastal survey), 50 Bryde's whales (offshore survey), 100 sei whales (offshore survey) and 10 sperm whales (offshore survey) will be sampled in sub-areas 7, 8, and 9. Regarding the coastal survey component, 60 common minke whales will be sampled in each of the early season and the late season. There was considerable disagreement within the Committee over most aspects of this programme including objectives, methodology, sample sizes, likelihood of success, effect on stocks and the amount and quality of data that could be obtained using non-lethal means.

ICELAND: NORTH ATLANTIC

The Committee noted that the proposal remains the same as last year, except that the schedule for taking 200 minke whales in two years has been revised. The revised schedule implies that the sample of 200 minke whales will be completed in 2006.

The objectives, methodology and arrangements for participation by scientists from other countries remain unchanged from the original proposal. The revised plan for sampling minke whales reduces the numbers of whales sampled per year in 2004 and 2005.

10.2 Commission discussions and action arising

As the meeting was running seriously behind schedule, Australia, with the agreement of other co-sponsors (Argentina, Brazil, Finland, France, Germany, Italy, Mexico, Monaco, the Netherlands, New Zealand, Portugal, San Marino, South Africa, Spain, Sweden, Switzerland, UK and the USA), withdrew a proposed draft Resolution that *inter alia* called on Japan to halt its research whaling in the Southern Ocean Sanctuary. The co-sponsors stressed that this withdrawal should not be interpreted as a reduction in their concern on this matter and requested that the record refer to a similar Resolution adopted last year (i.e. Resolution 2003-3[19]). Australia went on to note that during the 15 years over which JARPA has taken place, some 6,500 whales had been killed despite the fact that there has been no comprehensive assessment under peer review and no agreed abundance estimate for the stocks targeted. It believed that a full and comprehensive review of the outcome of the JARPA programme is needed before further work is contemplated and that any further research should employ non-lethal techniques. The UK and Germany associated themselves with these remarks.

New Zealand referred to the concern it has expressed for many years over scientific permit whaling, believing that the development of modern techniques such as molecular genetics have rendered lethal whale research redundant.

[16] For details of the Scientific Committee's deliberations on this Item see *J. Cetacean Res. Manage.* 7 (Suppl.).

[17] *J. Cetacean Res. Manage.* 5 (Suppl.).

[18] *Rep. Int. Whal. Commn.* 48: 95-105.

[19] *Ann. Rep. Int. Whaling Comm.* 2003: 103.

Furthermore, it did not believe that the research being done by Japan and Iceland to support fisheries management, rather than whale management, could be justified on moral or ethical grounds and questioned whether the research programmes would meet the ethical requirements of these countries domestic legislation. New Zealand did not dispute the right under Article VIII of the Convention for governments to issue special permits for research whaling, but was of the opinion that this right is being abused. Brazil also acknowledged these rights but considered that the current level of research whaling amounts to commercial-scale operations. It appealed to Japan to reconsider issuing permits to take whales in the Southern Ocean Sanctuary. Argentina associated itself with the remarks of New Zealand and Brazil. Sweden agreed with the moral/ethical argument put forward by New Zealand. It was also opposed to PowerPoint presentations during the plenary, preferring to have documents presented during the plenary with presentations outside the meeting room.

Italy suggested that an overlap between the diet of cetaceans and fish does not necessarily point to competition for food since this depends on the availability of a particular resource. It believed that catching whales to look at stomach contents is a too simplistic way to look at ecosystem trophodynamics. Rather it is necessary to apply complex models, which it did not believe had been done. The USA noted its strong opposition to the scientific permit whaling programmes that it believed had no quantifiable objectives. Like others, Monaco expressed concern regarding the escalation of scientific permit whaling and noted that in the last few years there has been a wealth of information published illustrating that problems with declining fisheries are due to massive over-fishing rather than competition between whales and fish. The UK made similar remarks. Switzerland was against the culling of whales on the assumption that they are in competition for fishery resources and associated itself with the comments of Italy and Monaco. The Netherlands associated itself with earlier remarks, particularly those of Australia, Sweden and Switzerland.

Japan, the Republic of Korea, Norway, St. Kitts and Nevis, Iceland and Dominica spoke in support of research programmes under special permit. Japan noted that it publishes the results from its research programmes in an open manner and that it would welcome scientists from New Zealand and other countries at its own planned JARPA review meeting. Contrary to the view of New Zealand, it did not believe its research under special permit to be either unethical or immoral. The Republic of Korea noted that some of its scientists had taken part in Japan's JARPN II programme and thanked Japan for this opportunity to co-operate. It believed that the results from the work would improve both fisheries and whale management. Norway stressed the importance of taking an ecosystem-based approach to the management of marine living resources and referred to on-going co-operation in this area with Iceland and Japan. It stressed that this type of research requires some time to yield useful results, noting that sufficient information for use in ecosystem modelling approaches had only been obtained in its own programme after some 10 years. It commended Japanese scientists on the interesting preliminary results from JARPN II. St. Kitts and Nevis suggested that those governments holding the view that alternative approaches to lethal whale research exist should develop their own research programmes to demonstrate this. It supported the work of Japan and urged them to continue. Iceland noted the agreement in various international fora that an ecosystem approach should be applied to the management of marine living resources. As part of the marine ecosystem, it believed that whales must be included in multi-species modelling for ecosystem-based management and that the only way to get information on feeding ecology with the accuracy necessary for such modelling is to look at stomach contents. It therefore considered such research important. Furthermore, Iceland indicated that it does not believe that there is anything wrong or unethical in taking animals from abundant stocks for scientific research. It does not take the view that some animals are more equal than others. Dominica welcomed the debate on this agenda item. It supported the remarks of Norway and Iceland and the continuation of research activities from which countries like itself without the capability for running such programmes could benefit. Referring to Iceland's comment on ecosystem management, Australia noted that this does not mean ecosystem manipulation which it believed seemed to be the objective of some of the existing research programmes.

Finally, the Chair of the Scientific Committee clarified that the Committee would continue to use existing guidelines to review future scientific permit research proposals and that it would not include work to revise the process as part of its standing agenda.

The Commission noted the Scientific Committee report and endorsed its recommendations.

11. ENVIRONMENTAL AND HEALTH ISSUES

11.1 Integration of environmental concerns with other Scientific Committee work and habitat-related issues

11.1.1 Report of the Scientific Committee

There is an increasing awareness that whales should not be considered in isolation but as part of the marine environment; detrimental changes to their habitat may pose a serious threat to whale stocks. The Committee has examined this issue in the context of the RMP and agreed that the RMP adequately addresses such concerns. However, it has also emphasised that the species most vulnerable to environmental threats might well be those reduced to levels at which the RMP, even if applied, would result in zero catches. Over a period of several years, the Committee has developed two multi-national, multi-disciplinary research proposals. One of these, POLLUTION 2000+ has two aims: to determine whether predictive and quantitative relationships exist between biomarkers (of exposure to and/or effect of PCBs) and PCB levels in certain tissues; and to validate/calibrate sampling and analytical techniques. The other, SOWER 2000 (IWC, 2000) aims to examine the influence of temporal and spatial variability in the physical and biological Antarctic environment on the distribution, abundance and migration of whales. Progress reports on both of these programmes were considered at this year's meeting.

Given the emergent threat of anthropogenic sound on cetaceans and other elements of marine ecosystems and also the potential for the Committee to assist in the development and interpretation of studies aimed at elucidating the potential impacts of anthropogenic noise on cetaceans, the Committee held a mini-symposium at this year's meeting, with presentations on the following topics:

(a) the effects of anthropogenic noise on marine animals and the possible synergistic effects between ambient ocean noise levels and other environmental stressors;
(b) physical acoustics and ambient noise in the ocean;
(c) audition and the physiology of hearing in cetaceans and the effects of intense sounds on cetacean hearing; and
(d) whale communication behaviour.

In conclusion, the Committee noted with great concern the impact on large whales in critical habitats of exposure to seismic sound pulses, particularly with respect to severely threatened populations such as the western gray whale. It agreed that there is now compelling evidence implicating that military sonar has a direct impact on beaked whales in particular. It also agreed that evidence of increased sounds from other sources, including ships and seismic activities, were cause for serious concern. The potential for cumulative or synergistic effects of sounds, as found in other taxa, with non-acoustic anthropogenic stressors was noted. A number of detailed recommen-dations were made concerning beaked whales and military sonar, mitigation and monitoring protocols with respect to seismic operations, and general recommendations on anthropogenic noise.

The Committee was pleased to hear that the intersessional Workshop on Habitat Degradation will take place in November 2004 at the University of Siena, Italy. The Committee also forwarded this year's SOCER (State of the Cetacean Environment Report) to the Commission.

The Committee also agreed that it was important to integrate work on environmental concerns with that of the other Sub-committees. It noted that next year's symposium on sea ice would be a joint venture with the IA (in-depth assessments) and BRG (bowhead, right and gray whales) Sub-committees.

11.1.2 Commission discussions and action arising

The UK believed that environmental concerns are paramount in the conservation and management of cetaceans and considered that the greatest threat to cetaceans is the degradation of their environment through chemical pollution, commercial fisheries and global environmental changes. Noting that the effects of noise pollution are a growing concern, the UK endorsed the Scientific Committee's comprehensive recommendations on this issue. It also applauded the Committee's work on other habitat degradation issues and looked forward to the outcome of the habitat degradation workshop. It believed the ongoing work on chemical pollution under POLLUTION 2000+ to be important in relation to conservation and consumption of cetaceans and encouraged its continued funding. The UK supported the steps being taken to integrate environmental concerns with other parts of the Scientific Committee's agenda but noted that the issues of noise and chemical pollution are agreed priority areas for the Standing Working Group on Environmental Concerns. Finally it thanked the editors of the SOCER report. New Zealand, Germany and Australia associated themselves with the remarks of the UK. Referring to the SOCER report, Australia noted the steps it is taking to protect the Great Barrier Reef and was pleased to see that the report next year will include a review of Antarctic cetacean issues.

The Commission noted the Scientific Committee's report and endorsed its recommendations.

11.2 Reports from Contracting Governments

There were no reports from Contracting Governments on national and regional efforts to monitor and address the impacts of environmental change on cetaceans and other marine mammals.

11.3 Health issues

There were no issues raised under this item.

12. WHALEWATCHING

12.1 Report of the Scientific Committee[20]

In 2000, the Committee had identified a number of areas for further research on possible long-term effects of whalewatching on whales and a number of possible data types that could be collected from whalewatching operations to assist in assessing their impact. The Committee developed this further at the 2004 meeting. The primary topic considered was a review of the results from the Workshop on the Science for Sustainable Whalewatching held in Cape Town, 6-9 March 2004. The Committee endorsed a number of recommendations from the Workshop concerning:

(1) the value of experimental studies to measure the impacts of whalewatching;
(2) new approaches and quantitative studies of relevance to the Scientific Committee;
(3) further development of a framework for the management of whalewatching similar in concept to those codified in the FAO Code of Conduct for fisheries;
(4) use of the precautionary approach in the absence of information of possible damaging effects of whalewatching;
(5) use of case studies to promote broad conclusions about assessing impacts of whalewatching on different taxonomic groups at a variety of life history stages;
(6) the development of whalewatching guidelines based on criteria that are simple, practical and objectively measurable under field conditions; and
(7) further development of the IWC's 1997 General Principles for the Development of Regulatory Frameworks for Whalewatching (see *www.iwc office.org*).

The Committee also reviewed whalewatching guidelines and regulations, and new information on dolphin feeding and 'swim-with' programmes.

12.2 Commission discussions and action arising

New Zealand, Brazil, the UK, Australia, Germany, Italy, Argentina, the USA and Spain supported the Scientific Committee's work in this area and in particular thanked South Africa for hosting the whalewatching management workshop. They endorsed the workshop's recommend-ations and expressed regret that there is still disagreement regarding the competency of Commission on this issue which they believed did fall within its mandate. Several

[20] For details of the Scientific Committee's deliberation on this Item see *J. Cetacean Res. Manage.* 7 (Suppl.).

countries noted that whalewatching is an ideal way to achieve optimal use of whale resources with New Zealand and Australia providing information on the contribution of whalewatching to their economies. Brazil ask the convenors of the Scientific Committee to give due attention to the funding of Invited Participants who could contribute to this debate. South Africa thanked the UK for its financial contribution to the workshop.

Norway noted that it supports whalewatching, has several whalewatching activities in northern Norway and sees no conflict between whalewatching and whaling. Its own experience is that they can benefit from each other. Iceland made similar remarks. Japan also believed that whalewatching and whaling can co-exist, but considered that the collection of data for scientific research from the former has limitations. It believed that whalewatching is outside the scope of the Convention. The Republic of Palau associated itself with the remarks of Norway, Iceland and Japan. The Republic of Korea noted that a recent effort to establish some whalewatching activities had failed because of conflict with fishing grounds.

The Commission noted the report of the Scientific Committee and endorsed its recommendations.

13. CO-OPERATION WITH OTHER ORGANISATIONS

13.1 Report of the Scientific Committee[21]

The Scientific Committee received reports of its co-operation with CMS (Convention on the Conservation of Migratory Species), ASCOBANS (Agreement on Small Cetaceans of the Baltic and North Seas), ACCOBAMS (Agreement on the Conservation of Cetaceans of the Black Sea, Mediterranean Sea and contiguous Atlantic Area), ICES (International Council for the Exploration of the Sea), IATTC (Inter-American Tropical Tuna Commission); ICCAT (International Commission for the Conservation of Atlantic Tuna), CCAMLR (Convention for the Conservation of Antarctic Marine Living Resources), Southern Ocean GLOBEC, NAMMCO (North Atlantic Marine Mammal Commission), FAO - Sub-committee on Fish Trade); PICES (North Pacific Marine Science Organisation); IUCN (International Union for the Conservation of Nature) and ECCO (Eastern Caribbean Cetacean Commission).

The Scientific Committee Chair drew particular attention to the part of its report dealing with co-operation with IUCN. He noted that in response to a request from IUCN, the Committee had reviewed its list of recognised species, including a critique of the status of the new Bryde's whale species *Balaenoptera omurai*. The Committee agreed that inclusion of the species in the IWC list of recognised species would be premature at present. It recommended that the Bryde's whale complex continue to be listed under the name *B. edeni* on a provisional basis and that research to resolve the uncertainties be undertaken. In particular, the Scientific Committee recommended that the Government of India be requested to facilitate collection and genetic analysis of a bone sample from the holotype specimen of *B. edeni* in Calcutta so that the taxonomy and nomenclature can be resolved.

[21] For details of the Scientific Committee's deliberation on this Item see *J. Cetacean Res. Manage.* 7 (Suppl.).

13.2 Commission discussions and action arising

The Commission noted the report from the Scientific Committee and endorsed its recommendations. There were no other reports.

The Commission noted that the 13th Conference of the Parties to CITES would be held in Bangkok between 2 and 14 October 2004. It agreed that IWC should be represented at the meeting but left it to the Advisory Committee to decide who the representative should be.

RESOLUTION ON POSSIBLE SYNERGIES WITH THE GLOBAL ENVIRONMENT FACILITY

Mexico, who introduced this draft Resolution on behalf of the other co-sponsors (Argentina, Belize, Brazil, Chile, Nicaragua, Panama, Peru and South Africa), explained that the Global Environment Facility (GEF) is primarily a financial mechanism designed to facilitate and direct financial resources into agreed areas of international environmental concerns. It noted that many international environmental Conventions (like the Convention on Biodiversity) work directly with GEF and was sure that many IWC delegates would be familiar with the GEF and its work. Noting that the Commission has limited resources to fund scientific work and that certain priority areas for some members continue to receive little or no funding, the Resolution's sponsors believed that it would be worth exploring with the GEF possible synergies, including funding.

After interventions from Dominica, Kenya and Ireland, the operative paragraphs of the draft Resolution were amended to read:

> 'NOW THEREFORE THE COMMISSION:
>
> DIRECTS the Secretariat to establish high level contact with the Secretariat of the Global Environment Facility and to:
>
> explore possible synergies and their possible utility of the GEF to the IWC, and investigate, *inter alia*, possible avenues for the utilisation of GEF funding for IWC related projects, with specific regard to:
>
> (i) Assistance for developing countries for scientific research and policies for scientific research, as directed by the IWC.
>
> (ii) The utility in joint projects seeking funding with other international organisations, such as, *inter alia*, the Convention on Biological Diversity, the Convention on Migratory Species, the World Heritage Convention, and the Ramsar Convention on Wetlands,
>
> (iii) An examination of the modalities that the GEF seeks to satisfy and whether IWC projects, now or in the future, could be made to fit such objectives.
>
> The Secretariat shall report back to the 57th IWC meeting on these matters.'

Switzerland pointed out that GEF's organisational structure identifies a GEF representative in each country, known as a focal point. It believed that if a country has a particular project for which they seek funding, it should approach GEF through the appropriate focal point. It indicated that it would abstain if the draft Resolution was put to a vote.

Norway sought clarification on the type of projects that might be undertaken in the proposed co-operation with GEF. Mexico stressed that for the moment the sponsors simply wished to begin to explore possibilities, but that from its own perspective, it would be interested in projects on issues such as bycatch and whalewatching. South Africa gave the example of aerial surveys of right whale populations. Norway suggested that perhaps the draft Resolution would best be discussed under agenda Item 15 on the Conservation Committee. The Republic of Korea questioned whether a Resolution is needed if all that is intended at this stage is for the Secretariat to contact GEF and explore possibilities. Japan found the proposal relating to joint projects unclear and believed that they probably would refer to areas that Japan did not consider of high priority for the Commission. It did not see any need to explore co-operation with GEF. Australia found the intention of the draft Resolution clear (i.e. to explore possible synergies) and considered that the developing countries sponsoring it deserved the Commission's support.

Responding to Norway, the Chair indicated that he did not think that it would be appropriate to refer this matter to discussions associated with the Conservation Committee given that that Committee is still in its early stages. The sponsors agreed. On being put to a vote the Resolution was adopted (Resolution 2004-5, Annex C), there being 30 votes in support, 8 against and 14 abstentions.

14. OTHER SCIENTIFIC COMMITTEE ACTIVITIES, ITS FUTURE WORK PLAN AND ADOPTION OF THE SCIENTIFIC COMMITTEE REPORT

14.1 Small cetaceans

14.1.1 Report of the Scientific Committee

Despite disagreement within the Commission over the management responsibilities of the IWC with respect to small cetaceans, it has been agreed that the Scientific Committee can study and provide advice on them. As part of this programme, the Committee has reviewed the biology and status of a number of species and carried out major reviews of significant directed and incidental catches of small cetaceans.

In 2001, the Government of Japan had indicated that it would no longer co-operate with the Committee on small cetacean related matters. In 2002, the Committee referred to the great value of the information provided by the Government of Japan on the status of small cetaceans in previous years and respectfully requested that the Government of Japan reconsider its position on this matter and resume the valuable contribution of Japanese scientists to its work on small cetaceans. Unfortunately, this has not yet happened.

This year, the primary topic considered was the franciscana. The franciscana is found along the Atlantic coasts of Brazil, Uruguay and Argentina, from approximately 18º to 42ºS. The Committee reviewed available information on stock structure, abundance, life history, ecology, incidental catches and status. It made a number of research recommendations given the paucity of information for some areas. Bycatch in gillnet fisheries occurs throughout the range of the franciscana. The Committee expressed its concern that in some areas, annual removal rates due to bycatch were between about 1.6 and 3.3% exceeding the 1% removal level determined by the Committee as sufficient to warrant concern regarding the status of small cetaceans.

The Committee referred to its endorsement of the concept of a series of regional Workshops with the general objectives of developing a short- and long-term approach to the successful management and mitigation of the cetacean bycatch problems in a region, building upon work already undertaken by the Committee (see section on Regional Workshops).

The Committee also reviewed progress on previous recommendations it had made, particularly those concerning the critically endangered baiji (*Lipotes vexillifer*) and vaquita (*Phocoena sinus*). The Committee received some information from China and welcomed the initiatives being taken, although it noted that the prospects for the baiji remain extremely poor.

The Committee has followed with considerable interest progress on conservation of the highly endangered vaquita; several members of the Committee also serve on the International Committee for the Recovery of the Vaquita (CIRVA). This year the Committee reviewed the report of the third meeting of CIRVA. The Committee reiterated its endorsement of the fundamental conclusions drawn by CIRVA - that the current grave conservation status of this species is due to fisheries bycatch. The Committee noted at least six records of bycatch in the past seven months and, in general, was disheartened by the lack of any substantial progress in reducing bycatches since last year's meeting. Therefore, the Committee urged the Government of Mexico to implement the previous recommendations of CIRVA and to take immediate action to eliminate the bycatch of this species in the northern Gulf of California.

The Committee has had considerable involvement in the assessment of the harbour porpoise (*Phocoena phocoena*) in the North Atlantic and has worked closely with ASCOBANS in the formulation of conservation programmes. This year the Committee reviewed and endorsed plans for the project *Small Cetaceans of the European Atlantic and North Sea*, or SCANS-II, which has three primary objectives: to update estimates of abundance from the original SCANS survey area and to obtain estimates for previously unsurveyed areas; to develop a management framework for assessing the impact of bycatches and setting safe bycatch limits; and to develop methods for monitoring small cetacean populations during periods between major decadal surveys.

The Committee also reiterated previous advice concerning the need to minimise or eliminate anthropogenic direct removals or threats to habitat of the Irrawaddy dolphin and the Ganges river dolphin.

In the light of new evidence, the Committee repeated its concern over the catches and quotas for some stocks of white whales and narwhals, particularly in Greenland, east Hudson Bay and the Russian Arctic. The Committee repeated previous requests for all Governments to submit relevant information on direct and incidental catches of small cetaceans in their national progress reports and for improved information on stock identity and abundance.

14.1.2 Commission discussions and action arising

Switzerland noted that the Scientific Committee had reinforced the recommendations it made last year concerning narwhals and white whales and informed the Commission that the CITES Animals Committee has subjected narwhals to significant trade review. Switzerland also explained that the CITES proposal on Irrawaddy dolphins deals with international trade and not bycatch or direct removals for national use. Germany, the UK and Sweden associated themselves with Switzerland's remarks. With respect to Irrawaddy dolphins, the UK drew attention to the Scientific Committee recommendation that all direct removals should cease until affected populations have been assessed to which it attached considerable importance. The UK further noted that the Scientific Committee has reviewed some but not all of the actions from past Resolutions on small cetaceans, and that the table of estimates of abundance and catches is incomplete. It was particularly concerned regarding the absence of information on directed takes of Dall's porpoise noting that the Scientific Committee in the past has indicated that takes were unsustainable. Australia associated itself with the UK's remarks on Dall's porpoise but particularly wished to highlight the Committee's concerns regarding the West Greenland stock of whale whales and narwhals. It believed that the Commission should also express serious concern given the statement that continued hunting at recent levels 'may result in the extinction of West Greenland narwhals in the near future'. New Zealand and Finland associated themselves with the remarks of Switzerland, the UK and Australia.

With respect to the recommendations on the West Greenland narwhal, Denmark referred to its well-known position that small cetaceans are outside the competence of the IWC.

The Commission noted the Scientific Committee report and endorsed its recommendations.

14.2 Other activities

14.2.1 Report of the Scientific Committee

STOCK IDENTITY

Of general concern to the assessment of any cetaceans is the question of stock identity. Examination of this concept in the context of management plays an important role in much of the Committee's work, whether in the context of the RMP, AWMP or general conservation and management. In recognition of this, the Committee has established a Working Group to review theoretical and practical aspects of the stock concept in a management context. The Committee has noted that it is important in any application of stock structure methods, to examine the sensitivity of conclusions to different *a priori* decisions about the definition of initial units, to ascertain which population structure hypotheses to examine.

A specialist Workshop to examine the use of simulation testing to assess the performance of methods to identify population structure was held in January 2003 and discussed at the annual meeting later that year. The Workshop developed a suitable simulation framework to allow evaluation of genetic methods used in inferring population structure both in general terms (the issue is of great relevance to conservation and management outside the IWC) and from a specifically IWC viewpoint (particularly in an RMP/AWMP context).

It was recognised that such a complex project must proceed in an iterative fashion and the Workshop concentrated on specifying the various modular tasks needed for Phase I of the process (*c.f. Initial Exploration Trials* in the AWMP process), for which some results might be expected within a year, while also identifying the types of scenarios that would need to be covered in Phase II and beyond. The Workshop report was published in *J. Cetacean Res. Manage.* 6(Suppl.). This year the Committee reviewed progress under Phase I of the TOSSM project (Testing Of Spatial Structure Models). It was pleased to see that great progress had been made on the most challenging module, i.e. the development and validation of a program to simulate realistic genetic datasets. Preliminary testing of various methods under certain simple scenarios will begin during the intersessional period.

DNA TESTING

This item is discussed in response to Commission Resolution 1999-8[22]. The Committee considered a report on the public sequence archive GenBank (National Center for Biotechnology Information, *http://www.ncbi.nlm.gov/*). The Committee recommended that members be urged to deposit sequences to be used in a published report in GenBank and include the GenBank accession numbers in publications, whether or not this is required by the journal (the Guide for Authors for the *Journal of Cetacean Research and Management* will be modified accordingly). It further recommended that similar practices be established for public archiving of non-sequence genetic data, such as microsatellite loci, primers, alleles, and profiles, where feasible. Such data are not presently accepted by GenBank, and some research may be necessary to identify a suitable archive. One potential provisional venue is the websites maintained by most major journals for supplementary data and information accompanying published papers.

The Committee welcomed the information on the status of the Norwegian minke whale DNA-register covering the years 1997-2002. It was noted that progress has been made toward achieving a fully diagnostic register; no samples were missing for the 625 whales landed in 2002. The number of missing samples in earlier years ranged from 3 to 11. No samples were reported from stranded whales.

No information on collection and archiving of samples in Japan was available to the Committee. It was noted that provision of a progress report on collection and archiving of samples would assist the Committee in meeting its terms of reference as assigned by the Commission.

PUBLICATIONS

The year 2004 was another productive year with respect to the IWC's scientific publications.

The IWC website now includes a downloadable file containing well over 6,500 references to documents that have been presented to the Committee since 1969. The file lists all of the documents by meeting and includes information on whether and where they have been published. The Committee reiterated the importance of Committee members urging their respective institutes and colleagues to subscribe to the *Journal* and to submit high quality papers to it. The success of the *Journal* will be greatly increased as it becomes established in more institutional libraries.

The Committee stressed the vital contribution the *Journal* makes to the work of the Committee and to the wider issues of the management and conservation of whales.

14.2.2 Commission discussions and action arising

Referring to the Scientific Committee report on (1) progress with the collection and archiving of samples from catches and bycatches and (2) reference databases and standards for a diagnostic register of DNA profiles, Sweden noted that while a report had been received from Norway, no reference was made to information from Japan. It asked whether there was an explanation for this omission. The Scientific Committee Chair noted that a request to Japan for information had been made but that nothing had been received.

[22] *Ann. Rep. Int. Whaling Comm.* 1999: 55.

14.3 Scientific Committee future work plan

14.3.1 Report of the Scientific Committee

The Chair of the Scientific Committee described the work plan drawn up by the Convenors, with the agreement of the Scientific Committee, after the close of the meeting. The work plan takes account of:

(1) priority items agreed by the Committee last year and endorsed by the Commission and, within them the highest priority items agreed by the Committee on the basis of Sub-committee discussions;
(2) general plenary discussions on this item and in particular the need to reduce the Committee's workload; and
(3) budget discussions in the full Committee.

14.3.1.1 RMP

As last year, this Sub-committee will concentrate on general issues as well as preparations for *Implementation*. The priority topics will be in priority order:

General issues

(1) finalise the guidelines and requirements for implementing the RMP;
  (a) develop the thresholds for defining 'acceptable', and 'borderline' performance for classifying the performance of RMP variants for *Implementation Simulation Trials*.
  (b) develop a list of agreed stock structure archetypes (in conjunction with SD, as necessary);
(2) further develop the 'simple model filter';
(3) finalise the issue of spatio-temporal considerations; and
(4) finalise the issue of the CATCHLIMIT program for running it in a trials situation.

Implementation process

(1) conduct an intersessional workshop to allow the Committee to be in a position to complete the *pre-implementation assessment* for western North Pacific Bryde's whales; and
(2) review progress on the development of stock structure hypotheses as part of the *pre-implementation assessment* for North Atlantic fin whales.

14.3.1.2 AWMP

The priority topics for this Sub-committee are:

(1) Greenland *SLA* development:
  (a) the 2004 aerial survey;
  (b) genetics simulation studies; and
  (c) *SLA* exploration and development;
(2) undertake annual review of catch data and management advice for minke and fin whales off Greenland;
(3) undertake annual review of catch data and management advice for humpback whales off St. Vincent and The Grenadines; and
(4) initiate planning for a bowhead whale *Implementation Review*.

14.3.1.3 BOWHEAD, RIGHT AND GRAY WHALES (BRG)

Given the workload of BRG anticipated during the 2005 meeting, a priority item was agreed concerning southern right whales (see below). The Sub-committee will therefore:

(1) review any new information on bowhead whale stock identity;
(2) undertake annual review of catch data and management advice for ENP gray whales;
(3) undertake annual review of catch data and management advice for BCB bowhead whales;
(4) participate in a joint symposium on the effects of high latitude (Arctic and Antarctic) sea ice on cetaceans;
(5) undertake annual review of the status of the western North Pacific stock of gray whales;
(6) undertake a review of new information on southern right whales; and
(7) if there is time: review new information on small stocks of bowhead and northern right whales.

14.3.1.4 IN-DEPTH ASSESSMENT (IA)

The topics of this Sub-committee, in order of priority, will be:

(1) estimate abundance of Antarctic minke whales;
(2) participate in a joint symposium on the effects of high latitude (Arctic and Antarctic) sea ice on cetaceans;
(3) review workshop report on SOWER cruise plans beyond 2004/05;
(4) begin work on an in-depth assessment of western North Pacific common minke whales, with a focus on J stock, assuming the availability of an abundance estimate for this stock;
(5) continue to examine reasons for differences between minke abundance estimates from CPII and CPIII; and
(6) brief review of report from an anticipated non-IWC sponsored workshop on sperm whales.

14.3.1.5 BYCATCHES AND OTHER ANTHROPOGENIC REMOVALS (BC)

This Sub-committee will, as its highest priority:

(1) further review methods to estimate bycatch based on fisheries data and observer programmes;
(2) further review methods to estimate bycatch based on genetic data, especially results from the workshop; and
(3) empirical analysis of the functional relationship of bycatch levels to fishing effort and to population abundance.

It is intended that the following topics will be priority items in 2006 given work expected to be completed by 2006 by other Sub-committees; thus in 2005 if there is time it may also briefly consider:

(4) information and methods on estimates of cetacean mortality caused by vessel strikes; and
(5) information and methods on estimates of cetacean mortality caused by other human activities.

14.3.1.6 SOUTHERN HEMISPHERE WHALES OTHER THAN ANTARCTIC MINKE WHALES (SH)

Priority items in order will be:

(1) complete in-depth assessment of Southern Hemisphere humpback whales with a focus on the C, D and E stocks:
  (a) investigate the distribution and allocation of historic catches to
    (i) proposed sub-areas of breeding grounds and
    (ii) from Antarctic Peninsula to Stocks A and G;
  (b) update the tables summarising the present state of knowledge and work required to continue a

Comprehensive Assessment of SH humpback whales;
(c) further investigation and clarification of proposed sub-areas for stocks on the breeding grounds; and

(2) preparation for assessment of blue whales in 2006.

14.3.1.7 ENVIRONMENTAL CONCERNS (E)

Priority items will be:

(1) sea ice and whale habitat: a joint special session with IA and BRG;
(2) review of the report of the Habitat Degradation Workshop.

It will also receive progress reports on:

(3) POLLUTION 2000+: finalise Phase 1 and prepare for Phase 2;
(4) Southern Ocean collaboration: planning and coordination of IWC participation and report back;
(5) SOCER: review of Arctic and Antarctic cetacean issues;
(6) Arctic issues: report on potential for future collaboration;
(7) issues related to impacts of anthropogenic noise on cetaceans; and
(8) issues related to habitat concerns.

14.3.1.8 STOCK DEFINITION (SD)

The priority items will be:

(1) review progress on the TOSSM project;
(2) continue review of statistical and genetic issues related to population structure (including DNA quality issues);
(3) possible definitions of unit-to-conserve and the implications for management;
(4) progress on use of tagging data in studying population structure; and
(5) review list of stock structure archetypes provided by RMP.

14.3.1.9 WHALEWATCHING (WW)

The two major priority items will be:

(1) assessing the possible population level impacts of whalewatching on whales;
(2) development of the scientific foundation of whalewatching guidelines.

In addition, the following lesser priority items in order will be:

(3) review of published whalewatching guidelines and regulations;
(4) reports of the Intersessional Working Groups;
(5) review of risks to cetaceans from whalewatching vessels (high-speed and others); and
(6) review of potential impacts of swim-with programmes.

14.3.1.10 SMALL CETACEANS (SM)

The Committee agreed that the priority items will be:

(1) review of status of the finless porpoise;
(2) review progress on previous recommendations; and
(3) review incidental catches and takes of small cetaceans by country.

14.3.1.11 SCIENTIFIC PERMITS (P)

The priority items will be:

(1) review research results from existing permits (including plans for a major review of the JARPA programme); and
(2) review plans for new and continuing permit proposals.

14.3.1.12 DNA

The priority items will be:

(1) review genetic methods for species, stock and individual identification;
(2) collect and archive tissue samples from catches and bycatch; and
(3) reference databases and standards for diagnostic DNA registries.

14.3.2 Commission discussions and action arising

The Republic of Korea welcomed the Scientific Committee proposal to look at the status of finless porpoise at next year's meeting. While it noted that its position is that management of small cetaceans is outside the competence of IWC, it would nevertheless ask its scientists to contribute to this review.

Japan believed that too much of the Scientific Committee's time is spent on items that Japan believes are lower priority and outside the mandate of the Commission (e.g. whalewatching, small cetaceans, environmental concerns), detracting from more important items such as in-depth assessments, work on the RMP, etc. It requested that if these lower priority items continue to be included on the Scientific Committee's agenda, that the Committee Chair and Vice-Chair prioritise the time allocated to different items. Japan noted that it shares the concern expressed by the Scientific Committee that the RMP is becoming unworkable, particularly in view of the outcome of the RMP *Implementation* for North Pacific minke whales. It believed that a significant part of the problem is due to the unnecessarily high tuning level used in the RMP and the fact that the RMP is generic rather than species or case specific. Japan considered that the Commission should give high priority to discussing these issues together with developing a management procedure that included ecosystem considerations. Finally it believed that the Scientific Committee should take a consistent approach to how it deals with uncertainty, e.g. in the RMP and in the AWMP and in determining stock structure. From this intervention, Australia understood Japan to be expressing a fundamental problem with the generic nature of the RMP and noted that this view is of concern.

Germany drew attention to the work on bycatch and in particular to the Committee's recommendation for a workshop on the use of market sampling to estimate bycatch. It considered it important that steps are taken to develop both short- and long-term approaches to solving or at least mitigating the cetacean bycatch problem. It believed that this should be done through regional workshops under the auspices of IWC in co-operation with regional organisations like ASCOBANS and ACCOBAMS. Sweden, Australia, Italy, New Zealand, Spain and Finland associated themselves with these remarks. Germany also informed the Commission that the European Union had recently adopted a regulation with measures to minimise cetacean bycatch through:

(1) a ban on drift nets;
(2) an obligation to use pingers in the gill net fishery; and
(3) an obligation to have scientific observers on pelagic trawlers.

PROPOSAL TO REALLOCATE FUNDING

On behalf of the 23 co-sponsors[23], Grenada introduced a proposal to redistribute the funding allocated to the proposed workshop on the use of market sampling to estimate bycatch across a number of other Scientific Committee activities that the proposers considered to be of higher priority but which were not fully-funded in the F&A Committee recommendations (i.e. the international workshop on North Pacific Byrde's whales, the AWMP developers fund, the estimation of abundance of Antarctic minke whales and SOWER 2004/05). Grenada explained that the proposal's sponsors had serious concerns over the utility of using market sampling to provide a better estimate of bycatch than can be gained from onboard observer programmes and by monitoring animals taken in set nets and traps that enter the market. They believed that the precision of the DNA mark/recapture method is quite low, meaning that it could not be used to account for total catches over time for purposes of the RMP. Furthermore, these countries considered that the market-based genetic methodology cannot be used in any case for estimating bycatch in countries where bycaught animals do not enter the market, even though these represent the majority of countries who have fisheries that are likely to take whales as bycatch. The proposers believed that the bycatch workshop could be put off without ill effect, while the other high priority items deserve to be completed as expeditiously as possible.

Austria, Australia, the UK and New Zealand spoke against this proposal, noting in particular that the Scientific Committee's recommendation for the bycatch workshop had already been discussed on two earlier occasions (in the F&A Committee and see section 6.1). Austria noted that should the proposal be adopted, it would feel obliged to revisit allocation across all projects, particularly those which currently have attracted no funding.

On a point of order, Sweden supported by Kenya, moved to adjourn the debate on this item. This motion was carried by a show of hands. On being put to a vote, the proposal to reallocate funding was not adopted, there being 19 votes in favour, 26 against and 2 abstentions.

14.4 Adoption of the Report

The Commission adopted the Scientific Committee report and its recommendations, including the future work plan.

15. CONSERVATION COMMITTEE

The meeting of the Conservation Committee took place on the afternoon of Wednesday 14 July and the morning of Thursday 15 July 2004. It was chaired by Horst Kleinschmidt (South Africa and Vice-Chair of the Commission). Delegates from 26 Contracting Governments participated. A summary of the Committee's discussions is included below. The full Sub-committee report is available as Annex H.

[23] Antigua and Barbuda, Belize, Benin, Dominica, Gabon, Republic of Guinea, Japan, Republic of Korea, Mauritania, Mongolia, Morocco, Nicaragua, Norway, Republic of Palau, Panama, St. Kitts and Nevis, St. Lucia, St. Vincent and The Grenadines, Senegal, Solomon Islands, Suriname, Tuvalu.

15.1 Report of the Conservation Committee

15.1.1 General discussion

As this was the inaugural meeting of the Conservation Committee, the Chair had invited members to address general issues relating to the establishment and purpose of the new Committee before turning to specific agenda items. There was consensus that all members of the IWC should be and were committed to conservation, and that the new Committee should not supervise or duplicate the work of any other bodies of the Commission. However, a range of views were expressed about the appropriateness or otherwise of the steps taken to establish the Conservation Committee and it was agreed that efforts since IWC/55 to improve the level of communication between members in disagreement were important.

Many of the co-sponsors of Resolution 2003-1, by which the Committee was established, stated that the new body should be viewed as pro-conservation, not anti-whaling. These members recognised that the Convention provides for both conservation and management of whale stocks, and believed that the establishment of the Conservation Committee did not prevent the fulfilment of either of these objectives. The conservation of whale stocks was in the common interest.

These members held the view that the establishment of the Committee would not alter or in any way impinge upon the attributions or work of any of the Commission's active bodies, nor would it change any of the functions or terms of reference of such bodies, or of the Commission itself. Rather, the primary objective in setting up the Conservation Committee in their view was to rationalise the Commission's work on that part of its agenda that deals with conservation issues, as well as to institutionalise and better distribute the Commission's workload. They emphasised that the Conservation Committee would not have any supervisory function over the work of the Scientific Committee, which has its agenda and terms of reference clearly established by the Commission.

Those who had supported the establishment of the Committee looked forward to the Committee improving the way the IWC met its responsibility for managing whales by addressing issues not only from the perspective of whaling. To date, conservation issues had been typically addressed late in the plenary, and the Committee would allow such issues to be discussed in detail several days before the plenary. The Committee could provide advice and guidelines on conservation-related functions that were currently dispersed, and serve as a central node to identify and prioritise topics. This might prevent overload on other bodies of the Commission.

Other members, who had opposed Resolution 2003-1, indicated that they still had reservations about the establishment of the Committee, especially because in their view it took the objective of the 'conservation of whale stocks' out of the context of the objective of making possible 'the orderly development of the whaling industry'. They were committed to the sustainable use of natural resources, and viewed completion of a Revised Management Scheme to prevent over-exploitation as a higher priority conservation measure than items that might be addressed under a Conservation Committee. Their participation in the first meeting should not be construed as change of position on the Resolution. These members stated that the process used at IWC/55 to create a new body made no attempt to bring the members of the IWC together:

a mechanism to address those conservation issues which are capable of attracting widespread support ought not to have been promoted in a manner which did not effectively consult nearly half of the members of the IWC. Some efforts to discuss alternative language had been rejected out of hand, which was not conducive to open and fair dealings.

Those who had opposed the establishment of the Committee noted that, even if nothing in Resolution 2003-1 defined conservation narrowly, the wording of the Resolution and its appendix of past decisions of the Commission made it clear that the initiative would alienate nearly half of the members of the IWC. Nonetheless, members present who had opposed the process had decided to attend the first meeting, expecting a change to the name of the Committee and amendment of the original Resolution, in order to reciprocate their goodwill.

The Committee discussed the question of how to define 'conservation', and particularly whether that should be construed as including 'sustainable use'. It was noted that various definitions were available, both from dictionaries (though there was no equivalent term in some languages), and in the texts and agreements of other treaties. While it was agreed that conservation was of interest to all members, and that further discussion on its definition would be worthwhile, a definitive answer was beyond the capacity of the Committee's first meeting. Some indicated that they had envisaged the Committee addressing issues that did not fit the remit of 'sustainable use', while others would welcome further discussion on this.

It was noted that many members of the Commission were absent. This could be viewed as an indication of dissatisfaction with the process by which the Committee was established. Supporters of the Committee indicated that they were engaged in a constructive dialogue with some of the absent members, in the interest of seeking broad participation, and hoped that the Committee's report might demonstrate to them the value of the Committee.

15.1.2 Relationship between the Conservation Committee and other bodies within the Commission

It was recognised that relationships between the Conservation Committee and other bodies within the Commission will be vital to the success and effectiveness of the new Committee and that relationships should be based on the principle of complementarity, not duplication.

The Committee agreed that interactions with the Scientific Committee would occur in the same way that the Scientific Committee interacts with other subsidiary bodies already established by the Commission. As with the Aboriginal Subsistence Whaling Sub-committee and the first meeting of the Conservation Committee, the Chair of the Scientific Committee would attend and provide information on scientific matters that are germane to that body's work.

Relationships with the Technical Committee were also addressed. Some members viewed the reference to 'conservation' in the Rules of Procedure that relate to the Technical Committee as evidence of potential overlap with the Conservation Committee. It was noted that Rule of Procedure M7 might need to be changed to avoid duplication of functions. The alternative view was that appropriate delegation of responsibility could ensure complementarity: the Commission could refer to the Technical Committee the development of proposed management measures that the Commission considered for adoption into the Schedule (i.e. matters pertaining to Article V), while referring to the Conservation Committee the development of the conservation agenda and related proposed recommendations (i.e. matters pertaining to Article VI).

15.1.3 Proposed Terms of Reference, working methods and funding considerations

Resolution 2003-1 contained three terms of reference for the Conservation Committee:

(1) the preparation and recommendation to the Commission of its future Conservation Agenda;
(2) the implementation of those items in the Agenda that the Commission may refer to it;
(3) making recommendations to the Commission in order to maintain and update the Conservation Agenda on a continuing basis.

Many felt that these should guide the initial work of the Committee and that additional terms should be developed if and when required. Further drafting work should proceed in an open process under the auspices of the Commission as a whole or its Chair. Others who would prefer alternative terms of reference or who had not commented were encouraged to make specific proposals.

In light of the concerns raised by those who had opposed Resolution 2003-1, a small group was formed to examine the language of the Resolution and further discuss terms of reference, outside of the Committee meeting. The group discussed concepts of conservation, ways to move forward after Resolution 2003-1, and terms of reference. It agreed to the importance of addressing conservation in the IWC and to respect different views on whaling. Furthermore the group offered for discussion a collection of possible ways forward, including different ways of defining the concept of conservation, and various alternatives, including Resolutions, that could clarify the work of the new Committee (see Annex H, Appendix 3).

The Committee agreed to hold annual meetings, in line with the practice of other committees and working groups. The Conservation Committee would not normally 'meet' intersessionally, other than by e-mail correspondence when necessary.

Paragraph 8 of Resolution 2003-1 charged the Committee with beginning to explore the possibility of a trust fund to make resources available both to the Commission and to Contracting Governments to implement research related to the Conservation Agenda. Discussion indicated it was premature to discuss this in detail and that in any case it would be up to the Commission to decide whether to establish such a fund.

15.1.4 Consideration of items to fall under the auspices of the Conservation Committee

The Committee recognised the value of establishing a list of items to address as part of the 'extensive conservation agenda' mentioned in its founding Resolution. The following were proposed as initial items of common interest: endangered species and populations; human impacts (e.g. noise, vessel strike, bycatch, entanglements, strandings); habitat protection for cetacean conservation; whalewatching best practice guidelines; reporting systems for strandings, entanglements and bycatch; legal and regulatory arrangements for cetacean conservation.

Some countries argued that the list is too general and too extensive. These countries argued that conservation issues are very important, but only for a small number of species and stocks of large whales. Many species and stocks of large whales are either quite numerous or rapidly growing, and for these, in their opinion, the items on the list above are not important for conservation.

Of the conservation-related items currently addressed by the Scientific Committee, the following were identified as most germane to the work of the Conservation Committee: highly endangered species and populations; scientific research related to development of techniques for improved assessment of status and mitigation measures to potential threats where identified; incidental takes of cetaceans including assessment of problems at the population level and development and evaluation of mitigation measures; non-consumptive utilisation of cetaceans; whales and their environment, with an emphasis on population level effects and interaction with interpreting abundance estimates; sanctuaries, in particular their value to the monitoring and recovery of depleted populations; scientific advice relevant to enforcement and compliance with conservation measures; collaboration with other organisations; voluntary submission of national reports on cetacean conservation.

15.1.5 Collaboration with other organisations

Through Resolution 2003-1, the Conservation Committee was directed 'to explore how the Commission can co-ordinate its conservation agenda through greater collaboration with a wider range of other organisations and conventions'. It was noted that the Committee could centralise collaboration, maintain an overview of those who serve as ambassadors for the IWC, and identify opportunities for new and improved collaborations. The Memorandum of Understanding between CMS and IWC was noted and a member of the CMS Secretariat indicated that CMS looks forward to continuing to work closely with IWC.

15.1.6 Development of a Conservation Agenda

The Committee viewed its discussion of terms of reference, relationships with other bodies, and items to fall under its auspices as the first steps towards the development of a conservation agenda. Some delegations considered it premature to enter into substantive discussions until a conclusion has been reached regarding the nature of the Conservation Committee. Other delegations disagreed with this and felt it was appropriate to start substantive discussions at this time.

15.2 Commission discussions and action arising

Austria, The Netherlands, Sweden, France, Australia, Mexico, Germany, New Zealand, the USA, Peru, Spain, the UK, Monaco, Oman and Finland all welcomed the report from the Conservation Committee, indicated their continued support for the Committee and looked forward to further intersessional work. Many congratulated the Chair on his preparation and management of the meeting and many stressed the need for wider participation from IWC members. Austria expressed the hope that constructive work could be done to save some of the most endangered species. The Netherlands drew attention to the report from the small group established within the Conservation Committee (see Appendix C, Annex H) and suggested that the Commission endorse the proposed way forward, i.e. that further discussions on the expectations of the work of the Conservation Committee should be continued under the responsibility of the IWC or its Chair to ensure that all views will be taken into account. Sweden was of the opinion that the Conservation Committee should start work on substantive matters at IWC/57 next year and indicated that it would work with others to ensure that concrete work does take place.

Iceland welcomed the apparent new-found willingness to discuss the nature of the Conservation Committee and expressed the hope that the preparatory work that should have been done last year to engage all members of the Commission would now be done. It believed this is necessary before the Committee enters into any substantive discussions.

Japan drew attention to the controversy surrounding the establishment of the Conservation Committee at the meeting in Berlin last year[24] and continued to be against it. Along with many other Commission members, Japan believed that the current objectives of the Conservation Committee are not in line with the dual objectives of the Convention, i.e. the conservation and management of whale resources. It further noted that it will not attend any meetings of the Committee unless its name and objectives are changed to include sustainable use of whale stocks. Dominica reaffirmed its position of last year and reserved its rights not to participate in the work of the Conservation Committee.

The Commission adopted the report of the Conservation Committee noting the reservations of Japan and Dominica.

16. CATCHES BY NON-MEMBER NATIONS

There were no contributions or discussion under this item.

17. FUTURE SUSTAINABLE WHALING

This new item had been included on the agenda at the request of Japan.

17.1 Introduction by Japan

Japan introduced, using a PowerPoint presentation, a document entitled '*The centennial of Antarctic whaling – from the history of over-harvesting to the creation of new sustainable whaling*'. The paper addressed:

(1) lessons from the past as a guide to the future;
(2) the status of Antarctic whaling;
(3) an overview of Antarctic whaling from 1904 to 2004;
(4) Japanese whaling in the Antarctic – its characteristics as compared to the whaling by other nationals – including sections on the importance of whale meat in Japanese Antarctic whaling (which compared how Norway, the UK, the USSR, the Netherlands and Japan used whale products, i.e. for oil, animal food, human consumption and other), and continuity of Japan's whaling culture from its traditional whaling to Antarctic whaling;
(5) failures of the past to manage large whales in the Antarctic – a meaningful lesson to make whaling successful in future;
(6) how international legal instruments prescribe the need for full utilisation of whales; and
(7) some aspects of future whaling.

Japan gave the following as the main points regarding how whaling should be conducted in the future.

[24] *Ann. Rep. Int. Whaling Comm.* 2003: 7-10.

(1) Setting of the catch limits with which the sustainability and the optimum utilisation of whale stocks are to be achieved is critical. The RMP must be structured to meet the original objectives. It is a management tool that is intended to achieve three objectives:
   (a) assurance to maintain the whale population at a safe level;
   (b) long term sustainability of whaling;
   (c) all possible risks are to be avoided. It might be necessary to improve the RMP to enhance these three factors in order to achieve optimum utilisation of whale resources.

   Further, research effort needs be strengthened with a view to implementing multi-species management, through which all the components of marine ecosystem, including large whale stocks, can be rationally used in a well-balanced manner.
(2) Scientific research as an integral part of whaling operations: As the realisation and pursuit of sustainable whaling is dependent and based on healthy whale populations, it is imperative that reliable scientific data should be made available. With this as a basis for the new sustainable whaling in future, unbiased scientific data collection must accompany whaling operations. For the purpose of achieving the sustainability of whale stocks and whaling activities at the same time, scientific research aspects should be incorporated as a part of whaling operations even if it is more burdensome to the efficiency of commercial operations or the pursuit of maximum profit. The successful results from the JARPA demonstrate that such research activities would make a significant contribution to our understanding and monitoring of the marine ecosystem and environment. Using whale management as a core to the ecosystem approach to the management of ocean resources, the potential for optimum utilisation of whales and other marine living resources can be enhanced.
(3) A full utilisation of catches made possible by human consumption of whales as food: A prime characteristic of Japanese whaling is that whales are regarded as a valuable food resource that must be fully used, not be wasted. This characteristic has been evidenced throughout the history of whaling in Japan, from the pre-modern whaling in the Edo Era to Antarctic whaling and the current research take of whales under the JARPA. The full utilisation of whales taken and the thought that whales are gifts bestowed by heaven to sustain humans are two sides of the same coin. The fact that respect to the whales' souls has been religiously manifested in many areas and in various periods of history in Japan gives a special feature to whaling culture in Japan. In considering the future of whaling activities, it seems quite beneficial to re-evaluate these aspects of full utilisation in Japanese whaling culture as a moral bulwark against the over-harvesting of resources, such as whales. This is ethically legitimate in the Japanese culture, and should be promoted in environmentally friendly societies.
(4) International contribution: Only abundant and robust whale stocks distributed in the Antarctic Ocean including Antarctic minke whales, estimated by the Scientific Committee of the IWC at 760,000 animals, will be harvested under the operation of new sustainable whaling. Sustainable utilisation of such rich resources is open to all nations subject to their rights and obligations under international law. However, at least at present, it seems that only Japan has the will and capacity to harvest the abundant whale stocks in the Antarctic. Therefore, it is our strong suggestion that, when Japan will commence this new whaling in the Antarctic Ocean, Japan should consider voluntarily using a part of any profit from the whaling activities to benefit the world's interests. This would provide other members of international community, especially developing countries, with the opportunity to benefit from the rich whale resources in the Antarctic. We hope that other countries will participate in new sustainable whaling and thus promote the noble purpose and objective of the ICRW.

Japan expressed the hope that this renewed approach to whaling would be welcomed.

17.2 Commission discussions and action arising

Norway noted that the information presented by Japan on Norway's use of whale products (i.e. mainly for oil) was correct but that it applied only to products from whales caught in the Antarctic. During the period 1945 to 1972, Norway was not using whales caught in the Antarctic for human consumption. However this was not the case with whales caught elsewhere. Norway stressed its long tradition of using whale meat for human consumption extending back to Medieval times using minke whales and some other species along Norway's coast. This tradition continues to this day, although of course the technology for taking whales has changed.

Referring to item (4) above, Australia stressed that there is no currently agreed Scientific Committee abundance estimate for Antarctic minke whales.

Regarding Japan's request that this item be kept on the agenda and anticipating future PowerPoint presentations, the UK respectfully suggested that in view of the already crowded agenda, this item be dealt with as a side event, e.g. during a coffee or lunch break. The Chair responded that the Secretary and Advisory Committee would consider, before the next Annual Meeting, how best to handle PowerPoint presentations.

18. INFRACTIONS, 2003 SEASON

The Infractions Sub-committee met on 14 July with delegates from 30 Contracting Governments. The Sub-committee's Chair, Sung Kwon Soh (Korea), summarised the group's discussions. The full report is given in Annex I.

As in previous years, despite differences of opinion as to whether the item concerning stockpiles of whale products and trade questions is within the scope of the Convention, the Sub-committee agreed that an exchange of views was useful.

The summary of catches by IWC member nations in the 2003 and 2003/2004 seasons is available as Annex J.

18.1 Report of the Infractions Sub-committee

18.1.1 Infractions reports from Contracting Governments

Infractions reports for 2003 were received from Denmark, St. Vincent and The Grenadines, the USA, the Russian Federation and the Republic of Korea. Only the USA and the Republic of Korea reported infractions.

The USA reported two infractions in 2003, which occurred during an aboriginal subsistence hunt, when a female bowhead whale accompanied by a calf was taken. The female was landed whilst the status of the calf was unknown. The taking of cow-calf pairs is prohibited in Eskimo hunting tradition, and also under the regulations both of this Commission and of the AEWC (Alaska Eskimo Whaling Commission) Management plan. The AEWC has primary enforcement responsibility under a cooperative agreement with the Government of the USA. Following a hearing, the AEWC Commissioners concluded that the crew had not acted with proper caution and rescinded the bowhead subsistence captain's registration for two years.

The Republic of Korea reported that the Ministry of Maritime Affairs and Fisheries and the marine police of Korea had exposed five illegal catches of minke whales in 2003 and had taken judicial and administrative measures (see Annex I, Appendix 3). Four of the cases were deliberate, the catches being taken covertly with a spear by small fishing vessels. The fifth case was that of a dead whale found floating with spearheads stuck into it. The Korean authorities perceive these incidents to be a result of poachers trying to make money. The Government of Korea does not think poaching to be a major problem since all suspect poachers are listed and their movements watched by the police. The bycatch reporting system has proved useful in discriminating between illegal catches and bycatches. In addition, the authorities have continued to strengthen public awareness of poaching activities through the mass media. The Government of Korea will continue its efforts to bring an end to these illegal activities. The Republic of Korea clarified that it is not permitted to carry harpoons on fishing vessels.

18.1.2 Surveillance of whaling operations

Information submitted by the USA, the Russian Federation and St. Vincent and The Grenadines indicated that 100% of their catches were under direct national inspection. Denmark (Greenland) reported on quota monitoring.

Following questions from New Zealand and the UK concerning internal legal requirements in Denmark for collection of DNA samples and actions in the event of the samples not being provided, Denmark reported that it was mandatory to supply samples, and that it had written to all municipal authorities in Greenland to inform them of this fact.

New Zealand considered that failure to collect samples should be reported as an Infraction since Article IX of the Convention requires each Contracting Government to 'take appropriate measures to ensure the application of the provisions of this Convention and the punishment of infractions against the said provisions in operations carried out by persons or by vessels under its jurisdiction' and Paragraph 29(b) of the Schedule requires samples to be collected.

Denmark did not agree with New Zealand's interpretation, as Paragraph 29(b) refers to small type whaling and not to aboriginal subsistence whaling. Denmark will try to take appropriate measures to ensure samples are collected in the future, but it considered that missing samples are not infractions in the sense of Article IX of the Convention. In addition, it would help if the hunters knew the samples would be put to good use, as at present many samples seem to be stored in freezers but not analysed. The Department of Fishing and Hunting will continue its efforts to collect samples.

New Zealand reiterated its opinion that collection of samples is obligatory under Para 29(b) of the Schedule and that failure to do so is an offence that should be reported as an infraction, particularly in view of the definition of 'small type whaling' in the Schedule and the strong language used by the Scientific Committee to express its concerns on this matter.

Following a suggestion from the Chair, New Zealand and Denmark agreed to discuss this matter further on a bilateral basis.

The UK noted that a bowhead whale was reported to have been killed in Greenland on 25 April 2004[25].

Australia expressed concern that since a new law had been enacted by Japan in 2001 allowing whales caught in nets to be killed, that the numbers of bycatch in Japan had increased dramatically, from 29 in 2000 to 79 in 2001, 109 in 2002 and to 125 in 2003. They cautioned that this could be considered an active hunt. Japan considered the question was not relevant to the Infractions Sub-committee. Rather, the Scientific Committee is the right forum for such discussions and Japan had provided information on bycatch to that Committee. It would respond directly to Australia on this issue if asked.

The UK noted that other countries e.g. Iceland and Korea also have significant levels of bycatch. It recognised that some other countries have a different opinion as to whether bycatch should be regarded as an infraction. However, the UK believed that everyone should agree that numbers of bycaught whales should be taken off any quota and, since the quota was zero, bycatch constituted an infraction.

18.1.3 Checklist of information required or requested under section VI of the Schedule

The following information was provided:

Denmark: Information on date, position, species, length and sex is collected for between 83-100% of the catch, depending on the item. Other biological data and information on killing methods and struck and lost animals are also collected.

USA: Information on date, species, position, length, sex, whether a foetus is present, killing method and numbers struck and lost is collected for between 97-100% of the catch depending on the item. Biological samples are collected for about 50% of animals.

Russian Federation: Information on date, species, position, length, sex, whether a foetus is present, killing method and numbers struck and lost is collected for 100% of the catch.

St. Vincent and The Grenadines: Information on date, species, position, length, sex, killing method and numbers struck and lost is collected for 100% of the catch.

Norway: the required information has been submitted to the Secretariat as noted in the Scientific Committee report[26].

[25] Denmark responded to a first question, which related to 2003, and said that no bowhead had been killed in 2003. It did not respond to the question of 2004 during the meeting, but subsequently reported that a bowhead whale had been seen in fishing nets in 2004 but that it had not been killed.
[26] *J. Cetacean Res. Manage.* 7 (Suppl.).

18.1.4 Submission of national laws and regulations
A summary of national legislation supplied to the Commission was prepared by the Secretariat. The UK and the USA applauded St. Vincent and The Grenadines for adopting domestic legislation that governs the aboriginal take of humpback whales. Australia expressed similar sentiments and enquired whether the regulations met the requirements of Schedule Para 13b(4). The Secretariat believed that they do and noted that the regulations were available if Australia wished to confirm this.

18.1.5 Other matters
The Secretariat had received no reports from Contracting Governments on availability, sources and trade in whale products and no comments were made during the meeting.

The UK referred to six northern bottlenose whales killed in the Faroe Islands in 2002 and noted that the Scientific Committee had expressed concern over the status of this stock in the 1970s. The UK asked a series of questions requesting details of the incidents. It noted that this species is included in Schedule Table 3 with a zero catch limit, and believed that the killing of these whales constituted an infraction.

Denmark responded that six whales had died as a result of stranding and that such events were not infractions. Denmark has provided information on similar events on a bilateral basis on many occasions in the past and would be happy to do so again.

The UK repeated that, because the species is in the Schedule, the reasons for the kills need to be documented.

Australia notified the Sub-committee of an alleged incident that occurred in 2004 in which a whale of unknown species was caught by an Australian fishing vessel, and the vessel returned to port with whale meat on board. The allegation has been referred to the Australian Federal Police for investigation. Australia will inform the IWC of the outcome of this matter once further details are available

18.2 Commission discussions and action arising
The UK noted that in the Sub-committee it had raised the issue of the killing of six Northern bottlenose dolphins in the Faroe Islands and asked for details of these incidents. It had been informed by the representative of the Faroese government that (a) the matter was no concern to the UK and (b) that the whales had stranded. The UK expressed concern with this response since it had heard from another source in the Faroes that stranded animals are normally successfully and relatively easily returned to the sea. It questioned why this had not been done in this case and why the kills were authorised. Germany associated itself with these remarks. Denmark did not respond. Japan considered the matter to be outside the competence of IWC. New Zealand disagreed.

The Commission took note of and adopted the Sub-committee's report.

19. LEGAL ADVICE IN RELATION TO THE IWC

19.1 Proposal regarding legal advice in relation to the IWC
As a first step in exploring how legal advice should be sought in the future, last year the Commission agreed that the Secretariat should investigate how other Conventions deal with legal issues and the sort of legal issues they have faced. This paper was provided as background information.

In addition, the Netherlands (who had first brought this matter to the attention of the Commission at the 5th Special Meeting of the Commission in October 2002[27]) introduced a paper that set out options on how to address future legal issues that may arise within IWC. It had prepared the paper to help to maintain momentum on this issue and to facilitate discussions. The options included:

(1) appointment of a legal officer;
(2) establishment of a legal committee;
(3) putting together a roster of legal experts;
(4) recourse to external legal advice on an ad hoc basis; and
(5) access to existing international judicial institutions.

The Netherlands noted that the options were not mutually exclusive and that an optimal legal function may require the selection of a mix of options. The paper did not include options for the settlement of disputes that may arise between Parties to the Convention or in connection with compliance with the Convention by Parties.

The Netherlands invited comments on the proposed options and the formulation of alternatives with the aim of the Commission taking an informed decision that would assist future deliberations. However, recognising that time remaining at this 56th Annual Meeting was short, the Netherlands proposed that its paper be referred to the F&A Committee at its meeting next year. The Netherlands remained convinced that establishing a mechanism for dealing with legal issues would help to depolarise and depoliticise debate and contribute to confidence building among countries.

19.2 Commission discussions and action arising
New Zealand welcomed the papers from the Secretariat and the Netherlands which reflected careful research and thought. New Zealand re-iterated its view that the 1946 Convention is deficient in its legal mechanisms and that legal issues would continue to cause difficulties with the work of the Commission. Its preferred approach in resolving the situation would be through a diplomatic conference that would have the goal of bringing the Convention's legal instrument up to date through the adoption of a Protocol covering a range of matters as raised under item 6.2 on the RMS. It accepted that consensus on such an approach would be illusive at present, and in the mean time noted the sovereign right of member states to determine their views on legal issues. That being said, New Zealand took the view, and would support, the Commission seeking legal advice, although the source of such advice would have to be carefully determined. Australia associated itself with these remarks.

Noting that FAO has a fairly substantial legal section, India suggested that early consultation with them may be helpful. Sweden, the USA, Argentina, Antigua and Barbuda also welcomed the paper from the Netherlands and supported the proposal to explore the matter further in the F&A Committee. Sweden found the options put forward in the paper interesting and believed that Option 1, appointment of a legal officer within the Secretariat, might be a good way to proceed. Argentina and Antigua and Barbuda expressed concern about the potential costs of this option, with Antigua and Barbuda suggesting that Option 2, establishment of a legal committee might be the best

[27] *Ann. Rep. Int. Whaling Comm.* 2003: 137-148.

approach at least in the first instance. Argentina stressed that the role of any legal adviser(s) or committee should be simply to provide advice, since it is the Commission that takes decisions. In view of the discussions on the RMS, the USA suggested that the F&A Committee also consider the need and role of a parliamentarian. Norway also welcomed the papers but was of the view that unless and until a new arbitration clause is included in the Convention (through a diplomatic conference), it is the sovereign right of member states to regulate their own obligations within the Convention. It therefore saw no need to investigate the matter further at this stage.

Noting Norway's comments, the Chair proposed that the issue be referred to the F&A Committee at IWC/57 as proposed by the Netherlands. The Commission agreed.

20. ADMINISTRATIVE MATTERS

Agenda items 20-22 covering administrative and financial matters were considered first by the Finance and Administration (F&A) Committee that met on Friday 16 June 2004 under the chairmanship of Halvard Johansen (Norway). Delegates from 35 Contracting Governments attended the meeting. The F&A Committee report is attached as Annex K.

20.1 Annual Meeting arrangements and procedures

20.1.1 Need for a Technical Committee

The Technical Committee (TC) has not met since in IWC/51 in 1999. However, the F&A Committee recommended that the need for the TC be kept under review and remain on the agenda since it may have a role to play when the RMS is completed and catch limits set.

The Commission agreed.

20.1.2 Use of simultaneous translation

Through Resolution 2003-4 adopted at IWC/55, the Commission had decided to establish a Working Group to explore the implications for the provision of technical components for simultaneous interpretation and to make recommendations on how provision of technical components for simultaneous interpretation may be provided at the IWC to accommodate the needs of contracting parties for whom English is a second language. Members of the Working Group comprised Antigua and Barbuda, Benin, France, Gabon, Republic of Guinea, Japan, Senegal, Spain and the Secretariat.

The Working Group proposed the following.

- Initially facilities for three languages would be provided (French, Spanish and Japanese). Japanese was proposed since most Japanese delegates speak in their mother tongue at the meetings. French and Spanish were proposed since, out of IWC's membership as of 2 July 2004, 15 countries are French-speaking and 16 countries are Spanish-speaking. In addition, requests have been made in the past for interpretation into these languages. It was further proposed that provision for additional languages could be considered at a later date (e.g. after two years).
- Initially, to help reduce costs, the technical set-up used would be that where headsets would be provided only for those national delegations using simultaneous interpretation, but with a view to moving toward the usual set up where headsets are provided to all delegates.
- Initially simultaneous interpretation would be provided only for the Commission plenary. Provision at other meetings (i.e. Commission sub-groups and private Commissioners' meetings) could be considered at a later date (e.g. after two years). It would seem prudent, both financially and technically to have a phased approach to provision of simultaneous interpretation.
- The Commission would meet most of the costs through an increase in the budget provision for the Annual Meeting (approx. 2% initially). If costs are in excess of this, then the host government would cover additional expenses. In the case where the Annual Meeting is arranged by the Secretariat in the UK (in the absence of an offer from a Contracting Government), the Working Group proposed that any additional costs to provide simultaneous interpretation equipment be met by drawing on the Commission's reserves.

The F&A Committee welcomed the Working Group report, recognised the importance of this issue and agreed that some action should be taken to facilitate the participation of delegates for whom English is not their first language so as to put all member countries on the same footing. There was general agreement that the costs of providing the technical facilities for simultaneous interpretation should be met by the Commission, although a suggestion was made that the Commission may also wish to seek voluntary contributions to support this provision.

Some F&A Committee members supported the approach proposed by the Working Group, although the view was expressed that if possible (e.g. by restricting the number of languages for which interpretation facilities would be provided to two rather than three), it would be desirable to extend provision of simultaneous interpretation facilities to the Commissions sub-groups (not including the Scientific Committee) and to the private Commissioners' meetings. Others felt that, with the increasing membership and increasing number of languages spoken by members, it would be appropriate for the Commission to take broader steps, allocating a higher percentage of the budget so as to provide, for example (and perhaps even in time for IWC/57 in Ulsan), interpretation for a greater number of languages and the translation of documents - as is the case in some other intergovernmental organisations. A number of members, however, expressed concern regarding the proposal to include translation of documents before the implications, particularly of cost, could be properly assessed. They did not believe there was sufficient time to make this assessment during IWC/56.

After a further exchange of views, the Committee agreed to recommend the following compromise to the Commission:

(1) That the Committee acknowledges the importance of facilitating the effective participation of all Contracting Governments in the work of the Commission and that no government should be disadvantaged by language;
(2) That in the first instance, equipment facilities for the provision of simultaneous interpretation be provided for French and Spanish for the Commission's sub-groups (but not the Scientific Committee), the Commission plenary and private Commissioners' meetings. This would come into effect in time for IWC/57 in Ulsan next year.

(3) That the budget provision for the Annual Meeting would be increased by 2%, as recommended by the Working Group.
(4) That the Secretariat should work intersessionally, with a small Task Force (composition to be decided), to develop cost estimates and implications for the provision of document translation at Annual Meetings and to report to the F&A Committee at IWC/57 in Ulsan for possible decision-making.

The Commission agreed to this approach.

20.2 Amendments to the Rules of Procedure and Financial Regulations

20.2.1 Election of the Chair and Vice-Chair of the Commission

Japan had introduced to the F&A Committee the following proposals concerning Rules of Procedure F.1 and G.1:

> Amendment of Rule F. 1: that the text be amended such that the Chair may be elected from among the Commissioners and Alternate Commissioners. The specific text of this proposal is that line 1 of rule F. 1. be amended to read: ***The Chair of the Commission shall be elected from time to time from among the Commissioners and Alternate Commissioners and shall…***
>
> Amendment of Rule G. 1: that the text be amended such that the Vice-Chair may be elected from among the Commissioners and Alternate Commissioners. The specific text of this proposal is that line 1 of rule G. 1 be amended to read: ***The Vice-Chair of the Commission shall be elected from time to time from among Commissioners and Alternate Commissioners and…***

In the Committee, a number of governments indicated that while they appreciated and understood the motivation behind the proposed amendments, they considered – as pointed out when this same matter was raised at IWC/54 in Shimonoseki – that the proposal was contrary to Article III.2 of the Convention and therefore illegal.

Japan noted this position. It indicated that it did not wish to pursue the matter any further with the Committee but noted that it may raise it in the Plenary. Japan subsequently withdrew the proposal and there was no discussion in Plenary.

20.2.2 Appointment of the Chair and Vice-Chair of the Scientific Committee

At the 2002 Scientific Committee meeting, the Scientific Committee developed a proposed procedure and amendment to the Rules of Procedure for the Scientific Committee regarding the appointment of its Chair and Vice-Chair. At its meeting this year, the Scientific Committee proposed that a second paragraph be added to Rule of Procedure C.5 of the Scientific Committee Rules of Procedure as follows (proposed new text in ***bold italics***):

> **C. Organisation**
>
> 5. The Committee shall elect from its members a Chair and Vice-Chair who will normally serve for a period of three years. They shall take office at the conclusion of the annual meeting at which they are elected. The Vice-Chair shall act for the Chair in his/her absence.
>
> ***The election process shall be undertaken by the heads of national delegations who shall consult widely before nominating candidates. Under normal circumstances, the Vice-Chair will become Chair at the end of his/her term, and a new Vice-Chair will then be elected. If the election of the Chair or Vice-Chair is not by consensus, a vote shall be conducted by the Secretary and verified by the current Chair. A simple majority shall be decisive. In cases where a vote is tied, the Chair shall have the casting vote. If requested by a head of delegation, the vote shall proceed by secret ballot. In these circumstances, the results shall only be reported in terms of which nominee received the most votes, and the vote counts shall not be reported or retained.***

The Scientific Committee proposal was reviewed by the Heads of Delegation to the Scientific Committee. They reconfirmed by consensus the Committee's support for its earlier position regarding secret ballots and agreed that the proposed Rule of Procedure should be revised to indicate that it was expected that the Vice-Chair would become Chair at the end of his/her term unless he/she declined. They therefore recommended that the following amended text be put forward to the Commission via the F&A Committee for adoption (proposed new text ***bold italics***):

> The election process shall be undertaken by the heads of national delegations who shall consult widely before nominating candidates. ~~Under normal circumstances,~~ The Vice-Chair will become Chair at the end of his/her term ***(unless he/she declines)***, and a new Vice-Chair will then be elected. ***If the Vice-Chair declines to become Chair, then a new Chair must also be elected.*** If the election of the Chair or Vice-Chair is not by consensus, a vote shall be conducted by the Secretary and verified by the current Chair. A simple majority shall be decisive. In cases where a vote is tied, the Chair shall have the casting vote. If requested by a head of delegation, the vote shall proceed by secret ballot. In these circumstances, the results shall only be reported in terms of which nominee received the most votes, and the vote counts shall not be reported or retained.

The Commission adopted the proposal.

20.3 NGO participation

20.3.1 NGO participation and Rules of Procedure

In September last year, the Secretariat had been approached by a representative of one of the large environmental NGOs regarding changes that a number of NGOs would like to rules of NGO accreditation in particular but also in their level of participation in Commission affairs. The Secretariat had brought this matter to the attention of the Advisory Committee to seek advice on the best way to proceed. The Advisory Committee agreed that this issue should be brought to the attention of the F&A Committee via a paper outlining the issues raised and the potential implications of these. The focus of the paper was on NGO participation in the Commission and its sub-groups excluding the Scientific Committee. The Advisory Committee had suggested that the F&A Committee have a general discussion on the matter this year and that if changes were suggested, decisions could be taken at IWC/57 next year, as appropriate

The Advisory Committee's discussion document addressed the four following issues:

(1) removal of the requirement that non-governmental organisations maintain offices in more than three countries;
(2) allowing accredited NGOs to send up to [five?] representatives to IWC meetings as observers with the possibility of all observers being in the meeting room at any one time;
(3) revising the fee structure for NGOs, such that the effect of the changes listed above is fee-neutral (cost-neutral?) in the year of its introduction and that thereafter, fees should not in general increase by more than such an amount as is necessary to keep pace with inflation in the UK (as host country to the IWC);
(4) formally confirming the right of NGO representatives to speak at IWC meetings, but with some limitation on the number of interventions that could be made.

The document stressed that, should the Commission decide to consider whether, and if so how, its Rules of Procedure might be amended to accommodate the wishes of some

NGOs for more active participation, certain requirements are paramount, i.e. that changes in the rules should not:

- impede the orderly and timely conduct of business in meetings of the Commission or its subsidiary bodies;
- result in an increase in the IWC's costs nor a diminution in its income;
- significantly increase either the number of NGO observers present at meetings, nor the volume of documentation which the IWC Secretariat is required to produce to accommodate them.

Given the discussions in the F&A Committee, its Chair concluded that IWC is already transparent since it is open to observers from non-member governments, other intergovernmental organisations, NGOs and in the case of the plenary, also to the media. He noted that some members had serious concerns regarding the granting of speaking rights to NGOs, but suggested that further consideration might be given to items (1) to (3) above. The F&A Committee agreed to his proposal that the Secretariat work with the Advisory Committee intersessionally to explore how items (1)-(3) might be implemented and to report to the F&A Committee next year, together with any recommendations as appropriate. It was understood that it will be necessary for the Secretariat to consult with NGOs on this issue and it was agreed that the issue of speaking rights be set aside for the time being. The Committee also supported the suggestion that if Contracting Governments do not consider the pre-conditions listed under the three bullet points above cover all of their concerns, they should be invited to contribute proposals for further pre-conditions that would help in limiting/better defining NGO attendance.

The Commission endorsed the approach proposed by the F&A Committee.

20.3.2 NGO code of conduct[28]

On Wednesday 21 July, the Chair reported to Plenary that a number of Commissioners had brought to his attention press releases and media interviews in which certain NGOs had made allegations regarding vote buying within IWC. One such press release had been made available to participants via the tables provided for the distribution of non-official documents. The Chair noted that a number of private meetings of Commissioners had been held to discuss this matter and to consider what, if any, action might be appropriate. While he noted that the Commission has traditionally welcomed the contributions of NGOs at its meetings, it considered that attendance carries certain responsibilities. On behalf of the Commission, the Chair expressed extreme concern regarding the circulation of unsubstantiated allegations that had caused offence to many Contracting Governments and urged all NGOs to behave with due and proper respect to all member Governments. He also noted the disruption to the Commission meeting caused by such allegations both in Sorrento and at IWC/55 in Berlin. As a result, the Chair reported that the Commission intends to develop a Code of Conduct for NGOs that would focus on NGO activities during the Annual Meeting and that could, if appropriate, include provisions related to the loss of accreditation. A working group convened by Iceland (members: Dominica; Japan; the Netherlands; New Zealand; St. Kitts and Nevis; Sweden; and the USA) had been established to develop this Code of Conduct that would hopefully be ready for review by the whole Commission at IWC/57 next year.

21. FORMULA FOR CALCULATING CONTRIBUTIONS

At its meeting last year, the Commission agreed that the Contributions Task Force should meet again prior to IWC/56 to try to finalise a proposal for a revised contributions formula. A meeting had been scheduled for May 2004. However, given the intersessional work of the Commission and its potential implications for any revised contributions formula, Henrik Fischer believed that it would be prudent to delay further work of the Task Force until these implications could be assessed. Consequently, while continuing to recognise the high priority the Commission gives to the development of a revised contributions formula, it was decided, after consultation with the Task Force members and with the Advisory Committee, to postpone the Task Force meeting.

In the F&A Committee, while recognising the sense of postponing the May 2004 Task Force meeting, a number of delegations stressed the importance of completing expeditiously the work on a revised financial contributions formula. There was also some discussion regarding Chair of the Task Force, given that Daven Joseph (Antigua and Barbuda) was no longer Commissioner or representing Antigua and Barbuda. There was some debate as to whether Chairs are appointed as individuals or as countries and whether Task Force Chairs should be appointed by the Commission or elected by the group itself. Noting these different views, the new Commissioner for Antigua and Barbuda was invited to convene a meeting of Task Force members to elect a Chair. Following a short meeting, the convenor was able to report that by consensus, the Task Force recommended that, if the Commission so wishes, the Task Force continue with the Commissioner for Antigua and Barbuda (Anthony Liverpool) as Chair and with the Commissioner for Argentina (Eduardo Iglesias) as Vice-Chair.

The Commission noted the F&A Committee report and endorsed its recommendations regarding the Chair and Vice-Chair of the Contributions Task Force. St. Vincent and The Grenadines expressed appreciation for the work that the Contributions Task Force had done and urged expeditious completion of its work. It fully supported retaining the Interim Measure adopted at IWC/54 in Shimonoseki for calculating financial contributions until a replacement is available. The new Task Force Chair noted his commitment to ensuring the Task Force completes its work in a timely manner and hoped that significant progress will be made by the Annual Meeting next year. St. Lucia associated itself with the remarks of St. Vincent and The Grenadines and the Task Force Chair.

Resolution to take into account the special position of very small countries in calculating financial contributions

Monaco and San Marino introduced a proposal to transfer their two countries from capacity-to-pay Group 3 to Group 2 under the Interim Measure. It was also proposed that this transfer have no effect on the contribution of Contracting Governments belonging to capacity-to-pay Group 1.

Under the Interim Measure, Contracting Governments are allocated into one of four 'capacity-to-pay' groups depending on their GNI and GNI per capita as follows:

[28] This was not a matter discussed by the F&A Committee.

Group 1 – countries with GNI < US $10 billion and GNI/capita <US$ 10,000;

Group 2 – countries with GNI > US $10 billion and GNI/capita <US$ 10,000;

Group 3 – countries with GNI < US$ 1,000 billion and GNI/ capita >US$ 10,000;

Group 4 – countries with GNI > US$ 1,000 billion and GNI/ capita >US$ 10,000.

Financial contributions are initially calculated using the ‘old’ formula. Group 1 and 2 countries were then given a 50% and 25% discount for the years 2002/03 and 2003/04 which was further reduced in 2004/05 by 25% and 10% respectively. The shortfall is distributed according to the following proportions: whaling countries 10%, Group 3 countries 30%, Group 4 countries 60%.

Monaco explained that the aim of the proposal was to correct an anomaly in the Interim Measure caused by an overestimation of the capacity-to-pay of very small countries. It suggested that Monaco qualified for this status as it has an area of only two square kilometres and a population of only 32,000. Most of the population are expatriates who, because no tax is levied, contribute nothing to the GNI of Monaco. It also noted that Monaco’s GNI (some 1.3 billion US$) is one of the lowest of those countries that are members of IWC. With such a GNI, Monaco is not able to sustain a military force or a navy, has only seven embassies around the world and can participate in only a limited number of international organisations of which the IWC is obviously one. Since adhering to the Convention in 1982, Monaco felt that it has contributed its fair share to resources and to debate and had hosted a number of meetings. However, it noted that since the introduction of the Interim Measure, Monaco’s financial contributions had increased from around £15,000 to over £25,000 putting a strain on the extent to which it has been able to participate in meetings. Monaco did not believe that it should be placed in Group 3 simply because it has many wealthy expatriates and suggested that it and San Marino (for the same reasons) be transferred to Group 2. Monaco added that if the Commission rejected the proposal, it would likely not be able to participate for much longer. It called for adoption of the proposal by consensus.

San Marino associated itself with the statements of Monaco.

France, Iceland, UK, Australia and New Zealand indicated that they could support the proposal. Argentina was sympathetic with the proposal but expressed concern that this would lead to other countries requesting re-allocation to a different capacity-to-pay group. It indicated, however, that it would not block a consensus. Norway expressed similar concerns and believed that the groupings should not be changed at this time. It suggested that the proposal be postponed to await the outcome of the work of the Task Force. Dominica also did not see the need to set such a precedent in view of the work of the Task Force. The USA noted that the problem described by Monaco is only one of several problems associated with the Interim Measure. It hoped therefore that the Commission would give a mandate to the Task Force to complete its work and submit a comprehensive formula to the Commission at IWC/57. Spain associated itself with the remarks of the USA. The UK did not believe that the Task Force could complete its work until an agreement had been reached regarding apportioning of costs associated with a future RMS. Japan associated itself with the remarks of the USA and others and asked the sponsors if they would withdraw their proposal and await the outcome of the work of the Task Force. Monaco declined as there is no guarantee that the Task Force would complete its work as early as suggested.

The proposal was adopted on being put to a vote (Resolution 2004-4, Annex C). There were 20 votes in support, 15 against and 17 abstentions. The Chair suggested that the Task Force give some consideration to defining was is meant by ‘very small countries’. Monaco suggested that Group 2 countries be those with GNI < 5 billion US$.

While congratulating Monaco and San Marino on the outcome, Ireland explained that it had abstained as it was concerned that such a move would set a precedent, with other countries making different cases for re-allocation of capacity-to-pay group. It urged the Task Force to complete its work. The USA associated itself with Ireland, and again called for the necessary mandate to be given to the Task Force. There was no further discussion on this matter. Switzerland who had abstained, associated itself with Ireland and the USA.

22. FINANCIAL STATEMENTS AND BUDGETS

The F&A Committee had received the report of the Budgetary Sub-committee that had worked intersessionally and had met during IWC/56 with Jean-Pierre Plé (USA) as Chair. The Budgetary Sub-committee had reviewed the provisional statement for 2003/2004 and proposed budgets for 2004/2005 and 2005/2006.

22.1 Review of provisional financial statement, 2003/2004

At the recommendation of the F&A Committee, the Commission approved the Provisional Financial Statements subject to audit.

During the F&A Committee, the Secretariat had reported that approximately 90% of financial contributions for the Financial Year 2003/04 had been received by the due date for settlement (28 February 2004). It had noted that the charging of penalty interest of 10% for late payments and the loss of voting rights provided a strong incentive for members to pay on time. In the Committee, concern was expressed by some that the 10% penalty interest charge presented difficulties to developing countries. The fixed rate of 10% interest was questioned at a time when market rates of interest are much lower. Dominica raised this issue during the Commission meeting and indicated that it planned to propose amendments to the Rules of Procedure next year.

22.2 Consideration of estimated budgets, 2004/2005 and 2005/2006

As recommended by the F&A Committee, the Commission:

(1) adopted the proposed budget for the 2004/2005 financial year (Annex L), including a 2% increase in provision for the Annual Meeting to take account of costs associated with simultaneous interpretation (see section 20.1.2) and the provision for research expenditure (Annex M); the reservations of Norway, Japan and Germany were noted (see Annex K);

(2) agreed that for the 2005 Annual Meeting the registration fee for non-government observers be set at £590 and that the media fee at £35; and

(3) noted the forecast budget for 2005/2006.

The USA noted that the outcome of discussions on the RMS and the intersessional plan of activity agreed as part of Resolution 2004-6 (Annex C), had cost implications that needed to be considered in relation to the budget for the next financial year (2004/05). The Secretary noted that the budget proposed had anticipated a certain level of intersessional activity of the RMS, and that apart from the RMS Working Group meeting scheduled to take place before December 2004, all other activities should be covered. She suggested that a Contracting Government may wish to host the first meeting of the RMS Working Group.

22.3 Secretariat offices

Last year, the Commission had agreed to the Budgetary Sub-committee's recommendation that the Secretariat explore a range of alternatives to its existing premises including:

(1) continuing to rent the Red House;
(2) purchasing the Red House or another suitable property in Cambridge or elsewhere in the UK; or
(3) relocation of the Secretariat to another member country.

The background to these recommendations is that the cost of the Secretariat represents a significant percentage of the IWC's budget (i.e. £958k out of £1,623k of operating expenditure - as per the 2002-03 audited accounts). The rental of Red House (i.e. £69k) represents 4.3% of the £1,623k of operating expenditure, while salaries, and allowances (i.e. £622k) represent 38% of the £1,623k of expenditure.

The Secretariat's report examined the criteria for relocation within the UK and overseas and the associated variables (rents, wind–up costs, set–up costs, transition costs, loss of expertise and effects on organisational effectiveness etc). It reached the conclusions given below.

- Currently there are savings to be made from relocating the IWC abroad, both in terms of lower rental costs and local salaries. The savings however may be sensitive to currency/economic fluctuations. Savings in expenditure in the early years of relocation could easily revert to additions to expenditure in later years.
- Over the transition period it is possible that transition costs (e.g. paying rent on two properties – if relocation occurred before the current lease expired) would equal or even exceed cost savings.
- If the current lease is continued until 2009, the rent will be capped at around £ 73,700 per annum from June 2005. This will give stability to costs and still provide a competitive rent in relation to alternative sites in the Cambridge area.
- The renewal of the lease in 2009 offers the chance to re-negotiate the current terms. The current lease only allows increases in rent. The chance to reduce the rent and allow rent decreases at each 5-yearly rent review could be explored.
- The focus of much of this paper has been on the relative costs of property and the relative costs of operating in various parts of the world. The costs associated with losing staff with the operational expertise and relationships that have been developed over many years should also be taken into consideration.
- The volatility of international markets make budgeting over a long time frame problematic. An effective Secretariat needs stability to function effectively and so its location should be considered within a long-term perspective. A country that can offer a stable cost base allied to operational effectiveness should give an acceptable balance between value and performance in the face of fluctuations in the world economy.

Recognising that:

(1) rent of the The Red House is not an excessive cost;
(2) expertise within the Secretariat would be lost if the Secretariat were moved away from the Cambridge area; and
(3) that there is still over five years until the current lease expires

the F&A Committee endorsed the Sub-committee's recommendations that the Secretariat explore alternatives within the Cambridge area, including those listed below.

- Ask the NASCO (North Atlantic Salmon Conservation Organisation) Secretariat in Edinburgh, Scotland how it managed to purchase its Headquarters building in terms of funding and what effect their status as an International Organisation had in buying property. (Financing any purchase would have to be carefully considered in the context of minimising the effects on Financial Contributions).
- Near the date of renewal of the lease, examine whether there might be any scope for the owners of Red House to 'gift' the property to the IWC. This might be an option if the inheritance tax status of the owner made this option advantageous.
- Keep the property market in Cambridge under active review to allow the early assessment of rental or purchase alternatives.
- If new property was acquired, to assess the possibility to renting part of that property as a means of minimising total property costs.

The Commission endorsed these recommendations.

22.4 Budgetary Sub-committee rota

At IWC/54 in Shimonoseki, 2002, the Commission adopted a rota for membership of the Budgetary Sub-committee. In summary:

- using the same country groupings as the Interim Measure for Financial Contributions[29], membership comprises:

  - 2 members from Group 1;
  - 2 members from Group 2;
  - 2 members from Group 3; and
  - Japan, USA + one other from Group 4;

- membership is for 2 years (except for Japan and the USA who have a 'permanent' place since they are likely to be the two highest paying contributors under almost any formula for the calculation of financial contributions for the foreseeable future being the highest payers now and probably in the future);
- any member that declines to serve to be replaced by the next member in alphabetical sequence within its Group;

[29] It is recognised that these country groupings were developed solely for the purposes of the Interim Measure for calculating financial contributions and may need revision when a new formula is adopted.

- new members of the Commission to be fitted into the cycle at the nearest alphabetical point after they have had a period in which to familiarise themselves with the organisation;
- the appointment of the Sub-committee Chair should be handled by the Chair of the Commission and the Advisory Committee.

At IWC/55 last year, the Commission agreed that the Secretariat review the current rota system with a view to:

(1) making it more attractive for countries to serve on the Sub-committee;
(2) providing greater continuity;
(3) improving the process for selection of the Sub-committee Chair; and
(4) reporting back to the Budgetary Sub-committee for further action as appropriate.

At its meeting this year, the Sub-committee reviewed a variety of options put forward by the Secretariat for consideration regarding items (1) to (3) above and recommended to the F&A Committee that the following be incorporated into the membership rota system:

<u>To encourage participation in the Sub-committee:</u>

A. When inviting countries to serve, stress not only the importance of the work of the Sub-committee (it really does make the job of the F&A Committee much easier and more efficient), but also that the workload is not high - either intersessionally or at Annual Meetings. The Sub-committee is only active during the period from March to when the annual meeting is held – and this only involves responding to documents/proposals from the Secretariat. All intersessional work is done by email/fax and no meetings are involved. At annual meetings, the Sub-committee generally meets for only 1-2 sessions.
B. Undertake to schedule meetings of the Budgetary Sub-committee when other Commission sub-groups are not meeting and try to avoid scheduling the Budgetary Sub-committee at the beginning of the series of Commission sub-group meetings (because not all delegations arrive in time to otherwise participate).
C. Keep the four economic groups, but add two 'open seats' (i.e. for any interested countries) as a fifth category. Countries filling the two open seats would need to be identified and agreed at the meeting of the Finance and Administration Committee. Formalise the current informal arrangement allowing Contracting Governments not members of the Budgetary Sub-committee to attend meetings as observers.

<u>To provide greater continuity:</u>

D. Extend the term of members from 2 to 3 years.
E. Appoint not only a Sub-committee Chair but also a Vice-Chair. Under normal circumstances, the Vice-Chair would replace the outgoing Chair. This would have the effect of two Sub-committee members serving for either four years (under the current system) or six years if the term of all members was extended as proposed in D above.

<u>Improving the process for the selection of the Sub-committee Chair and Vice-Chair</u>

F. That the Sub-committee elects its own Chair (as is the case in other Commission sub-groups – and indeed the Commission itself);

The Commission endorsed these recommendations. It also agreed that:

- Germany and Norway be invited to take the 'open seats' commencing immediately following IWC/56;
- the Budgetary Sub-committee provide clearer guidelines for its operation (i.e. term for the 'open seats' and status of observers from Contracting Governments not on the Sub-committee) and to report back its conclusions to the F&A Committee next year.

The proposed rota for the budgetary Sub-committee for 2004/05 onwards is given in the F&A Committee report (Annex K).

22.5 Other matters

In the F&A Committee, Brazil briefly drew attention to its concern regarding the costs incurred to Contracting Governments, especially those of developing countries, of sending delegations to Annual Meetings, particularly given the length of the meeting series. It hoped that host governments and the Secretariat would take account of these concerns when determining the timing and location of Annual Meetings. This was supported by a number of other governments. The Committee took note of this concern and drew it to the attention of the Commission.

23. ADOPTION OF THE REPORT OF THE FINANCE AND ADMINISTRATION COMMITTEE

The Commission adopted the report of the F&A Committee.

Resolution on the frequency of meetings of IWC

On behalf of the other sponsors (Australia, Belgium, France, Germany, Italy, Kenya, Monaco, Norway, San Marino, Spain, South Africa and Switzerland), Ireland introduced a draft Resolution to, *inter alia*:

(1) accept the principle of IWC meetings being held less frequently than regular Annual Meetings, coupled with ensuring that intersessional meetings do not increase as a counter balance;
(2) create a working group to investigate (by correspondence) and make recommendations to IWC/57 on the implications of less frequent meetings;
(3) use the working group recommendations as a basis for a detailed Resolution at IWC/57 and a change in the Rules of Procedure of the Commission at IWC/58; and
(4) apply the principle of less frequent meetings after IWC/58 in 2006.

Ireland noted that that the increasing burden of Annual Meetings in terms of costs and personnel has been discussed on previous occasions and that the suggestion of less frequent meetings is not a new one. It drew attention to other Conventions dealing with fisheries, biodiversity and the environment who organise their affairs effectively on the basis of biennial or triennial meetings and hoped that the draft Resolution could be adopted by consensus.

The UK expressed its willingness to consider the proposal for less frequent meetings in principle, but noted that less than annual meetings might cause difficulties if the Commission adopts an RMS and starts to set catch limits. It noted that other Conventions with biennial or triennial meetings are set-up rather differently than IWC, with, in many cases, Sub-committees being established to do the bulk of the work. By contrast, the ICRW requires actions to be taken by the Commission. It therefore was not generally in favour of the proposal. South Africa appreciated these remarks but urged that the issue be pursued fully.

The USA was not opposed to considering less frequent meetings, but suggested a number of amendments to the draft Resolution to: (1) propose that the principle of less frequent meetings be 'explored' rather than 'accepted'; and (2) delete reference to the draft Resolution and changes to Rules of Procedure. Ireland indicated that it could accept these amendments and suggested that as a result, reference to implementation of less frequent meetings be applied after IWC/58 be deleted. The other co-sponsors agreed to these changes.

Denmark could agree to explore the issue, but like others, suggested that less frequent meetings might not be practical if an RMS was adopted and catch limits had to be set.

Dominica welcomed the proposal but suggested that a clause be inserted to urge that work on the RMS proceed expeditiously during the intersessional period leading up to IWC/57 next year.

Iceland and Japan indicated that they could not support the proposal at present, believing it to be premature. Iceland considered that it might delay adoption and implementation of an RMS. Japan believed that work on the RMS should be completed first and that for the time being, it is necessary for the Commission to meet annually. Kenya saw no connection with the RMS and urged that the proposal be adopted by consensus. Chile was against the proposal for more practical reasons. It believed: (1) that intersessional activity would increase and that it would have difficulties in finding the funds necessary to enable it to be involved; and (2) that its Government would force a reduction in annual contributions (since meetings would no longer be held annually). In response to Chile's second remark, Ireland suggested that less frequent meetings should lead in any case to either a freezing or a reduction in financial contributions.

Although Iceland, Japan, Chile and Argentina were not in favour of the proposal, they indicated that they would not block consensus. The Resolution, amended as described above, was then adopted, noting the concerns of these countries (see Resolution 2004-7, Annex C).

24. DATE AND PLACE OF ANNUAL AND INTERSESSIONAL MEETINGS

24.1 57th Annual Meeting, 2005

The Republic of Korea reported that IWC/57 will be held at the Lotte Hotel in Ulsan during the period 30 May to 24 June 2005 – the exact timing to be decided by the Commission.

The Secretary introduced a provisional schedule for the meeting, noting in particular that given Resolution 2004-6 on Completion of the RMS, two days had been allocated for a meeting of the RMS Working Group, and the meeting of the Commission had been extended from four days to five. The Commission agreed with the timing proposed, i.e. that the Scientific Committee meet from 30 May to 10 June (with a pre-meeting on sea ice and whale habitat and a workshop on the use of market sampling to estimate bycatch taking place in the period 27-29 May), the Commission sub-groups in the period from 13 to 17 June, and the Commission from Monday 20 to Friday 24 June 2005.

24.2 58th Annual Meeting, 2006

The Commission had received two offers to host the Annual Meeting in 2006; one from France, the other from St. Kitts and Nevis. As neither country was able to offer to host a meeting in a subsequent year, the location of IWC/58 was put to a vote by secret ballot. There were 27 votes for St. Kitts and Nevis, 25 for France and 1 abstention. The 2006 meeting will therefore be held in St. Kitts and Nevis.

24.3 Other

Spain indicated its willingness to host the Annual Meeting in 2007 but indicated its flexibility regarding the year. Kenya indicated that it intended to offer to host the meeting in 2008, but like Spain, was willing to be flexible.

25. ELECTION OF THE CHAIR AND VICE-CHAIR

At last year's meeting, Henrik Fischer (Denmark) and Carlos Dominguez Diaz (Spain) were elected as Chair and Vice-Chair respectively for a 3-year term. However, as Carlos Dominguez Diaz was unable to continue as Vice-Chair a replacement had to be elected. Horst Kleinschmidt (Commissioner for South Africa) and Minoru Morimoto (Commissioner for Japan) were proposed. On being put to a vote by secret ballot, Mr Kleinschmidt was elected. He received 26 votes. Mr Morimoto received 25 and there were two abstentions. It was agreed that Mr Kleinschmidt's appointment would be for three years.

26. ADVISORY COMMITTEE

At last year's meeting, the Commissioners from Dominica and the UK were elected onto the Advisory Committee to replace the Commissioners from St. Lucia and the USA respectively. Since St. Lucia had remained on the Advisory Committee for three years (instead of the usual two years as stipulated in Rule of Procedure M.9), the Commission agreed that Dominica should serve on the Advisory Committee for one year only – its term ending at IWC/56. At IWC/56, the Commission reappointed Dominica to serve on the Advisory Committee for a further two years.

27. SUMMARY OF DECISIONS AND REQUIRED ACTIONS

A summary of decisions and actions required is provided at the beginning of this report.

28. OTHER MATTERS

On behalf of the Commission, the Chair warmly thanked the Government of Italy for hosting the 56th Annual Meeting and for providing such a magnificent location and venue. He also extended his thanks to Mr Morimoto for his support as Vice-Chair, the Secretariat, the interpreters and the staff of Studio Ega who had helped in meeting organisation.

Several countries expressed deep appreciation to both the Chair and Vice-Chair for managing in an extremely efficient and accommodating way what they considered to be a very good meeting.

The meeting was closed at 17.10 on Thursday 22 July 2004.

29. AMENDMENTS TO THE SCHEDULE

The amendments to the Schedule adopted at the meeting are provided in Annex N.

Annex A

Delegates and Observers Attending the 56th Annual Meeting

Annex B
Agenda

1. INTRODUCTORY ITEMS
   - 1.1 Welcome Address
   - 1.2 Opening Statements (IWC/56/OS)
   - 1.3 Secretary's Report on Credentials and Voting Rights
   - 1.4 Meeting Arrangements
   - 1.5 Review of Documents (IWC/56/1)

2. ADOPTION OF THE AGENDA (IWC/56/2)

3. SECRET BALLOTS
   (*Chair's Report of the 55th Annual Meeting, Section 3*)
   - 3.1 Proposal to amend Rule of Procedure E.3 (d)
   - 3.2 Commission discussions and action arising

4. WHALE STOCKS
   (*Chair's Report of the 55th Annual Meeting, Section 6*)
   - 4.1 In-depth assessment of western North Pacific common minke whales
     - 4.1.1 Report of the Scientific Committee (IWC/56/Rep 1)
     - 4.1.2 Commission discussions and action arising
   - 4.2 Antarctic minke whales
     - 4.2.1 Report of the Scientific Committee (IWC/56/Rep 1)
     - 4.2.2 Commission discussions and action arising
   - 4.3 Southern Hemisphere whales other than minke whales
     - 4.3.1 Report of the Scientific Committee (IWC/56/Rep 1)
     - 4.3.2 Commission discussion and action arising
   - 4.4 Other small stocks – bowhead, right and gray whales
     - 4.4.1 Report of the Scientific Committee (IWC/56/Rep 1)
     - 4.4.2 Commission discussion and action arising
   - 4.5 Other

5. ABORIGINAL SUBSISTENCE WHALING
   (*Chair's Report of the 55th Annual Meeting, Section 7*)
   - 5.1 Aboriginal subsistence whaling scheme
     - 5.1.1 Report of the Aboriginal Subsistence Whaling Sub-committee (IWC/56/Rep 3)
     - 5.1.2 Commission discussions and action arising
   - 5.2 Aboriginal subsistence whaling catch limits
     - 5.2.1 Report of the Aboriginal Subsistence Whaling Sub-committee (IWC/56/Rep 3)
     - 5.2.2 Commission discussions and action arising
   - 5.3 Revision of Schedule paragraph 13 (IWC/56/4)
     - 5.3.1 Report of the Aboriginal Subsistence Whaling Sub-committee (IWC/56/Rep 3)
     - 5.3.2 Commission discussions and action arising
   - 5.4 Other

6. REVISED MANAGEMENT SCHEME (RMS)
   (*Chair's Report of the 55th Annual Meeting, Section 9*)
   - 6.1 Revised Management Procedure (RMP)
     - 6.1.1 Report of the Scientific Committee (IWC/56/Rep 1)
       - general issues
       - preparation for implementation (western North Pacific Bryde's whales, North Atlantic fin whales)
       - bycatch
     - 6.1.2 Commission discussions and action arising
   - 6.2 Revised Management Scheme
     - 6.2.1 Chair's report on intersessional work
     - 6.2.2 Commission discussions and action arising
   - 6.3 Other

7. WHALE KILLING METHODS AND ASSOCIATED WELFARE ISSUES
   (*Chair's Report of the 55th Annual Meeting, Section 8*)
   - 7.1 Reporting on data on whales killed and on improving the humaneness of whaling operations (IWC/56/5-8)
   - 7.2 Commission discussions and action arising

8. SANCTUARIES
   (*Chair's Report of the 55th Annual Meeting, Section 10*)
   - 8.1 Review of the Southern Ocean Sanctuary
     - 8.1.1 Report of the Scientific Committee (IWC/56/Rep 1)
     - 8.1.2 Commission discussions and action arising and possible Schedule amendment proposal
   - 8.2 Improvements to the sanctuary review process
     - 8.2.1 Report of the Scientific Committee (IWC/56/Rep 1)
     - 8.2.2 Commission discussions and action arising
   - 8.3 South Pacific Sanctuary
     - 8.3.1 Proposal to amend the Schedule to establish a sanctuary (IWC/56/9)
     - 8.3.2 Commission discussions and action arising
   - 8.4 South Atlantic Sanctuary
     - 8.4.1 Proposal to amend the Schedule to establish a sanctuary (IWC/56/10)
     - 8.4.2 Commission discussions and action arising
   - 8.5 Other

9. SOCIO-ECONOMIC IMPLICATIONS AND SMALL-TYPE WHALING
   (*Chair's Report of the 55th Annual Meeting, Section 11*)
   - 9.1 Proposal to amend the Schedule
   - 9.2 Commission discussions and action arising

10. SCIENTIFIC PERMITS
    (*Chair's Report of the 55th Annual Meeting, Section 12*)
    - 10.1 Report of the Scientific Committee (IWC/56/Rep 1)
      - 10.1.1 Improvements to review procedures

26. SUMMARY OF DECISIONS AND REQUIRED ACTIONS

27. OTHER MATTERS

Annex C

Resolutions Adopted during the 56th Annual Meeting

Resolution 2004-1

RESOLUTION ON THE WESTERN NORTH PACIFIC GRAY WHALE

CONCERNED that the IUCN listed the western gray whale as ‘critically endangered’ in 2000 because of its geographic and genetic isolation combined with the small population size of about 100;

FURTHER CONCERNED that the Scientific Committee has noted that only 23 reproductive females are known;

NOTING that the Scientific Committee in 2004 strongly agreed that the evidence that this population is in serious danger of extinction is compelling;

RECALLING that in 2001 the Commission passed a Resolution (Resolution 2001-3) calling on range states and others to actively pursue all practicable solutions to eliminate anthropogenic mortality in the western North Pacific gray whale stock and to minimise anthropogenic disturbances in the migration corridor and on their breeding and feeding grounds;

DEEPLY CONCERNED by the report of the 2004 Scientific Committee that states that the recovery and growth of the population appear to be hindered by a variety of biological difficulties and that the onset of oil and gas development programs is of particular concern with regard to the survival of this population;

NOTING the management recommendations of the 2004 Scientific Committee that as a matter of absolute urgency measures are taken to protect this population and its habitat off Sakhalin Island;

NOTING that although there already was independent scientific advice, there is, nevertheless, a continued need for expert and independent scientific advice on the effects that oil and gas development projects might have on the western North Pacific gray whale stock;

NOTING that in recent years significant resources and effort in studying the western North Pacific gray whale stock near Sakhalin Island, and that in view of the uncertainty over the possible negative impacts on the population and its habitat by current oil and gas activities, this kind of research and monitoring must be continued in greater detail as oil and gas activities increase in scale; and

FURTHER NOTING that the International Whaling Commission is internationally recognised as having competence for the management and conservation of whale stocks, has a wealth of scientific knowledge and expertise and has been reviewing research on the western gray whale population off Sakhalin Island since 1995;

NOW THEREFORE THE COMMISSION:

CALLS UPON range states and others to be mindful of Resolution 2001-3 when contemplating exploration projects in and around Sakhalin Island and to continue to observe the recommendations to actively pursue all practicable actions to eliminate anthropogenic mortality in this stock and to minimise anthropogenic disturbances in the migration corridor and on breeding and feeding grounds;

ENDORSES all conclusions and recommendations of the 2004 Scientific Committee concerning western gray whales including that:

(1) ‘as a matter of absolute urgency that measures be taken to protect this population and its habitat off Sakhalin Island’;
(2) ‘strongly recommends that the ongoing Russian-US and Russian and Republic of Korea national programmes on western gray whale research and monitoring continues and expands into the future’;
(3) ‘strongly recommends that all range states develop or expand national monitoring and research programmes on western gray whales’;
(4) ‘strongly recommends that in situations when displacement of whales could have significant demographic consequences, seismic surveys should be stopped.’

REQUESTS that the Secretariat urgently offers its services and scientific expertise to the organisations concerned with oil and gas development projects and potential exploration projects in the Sakhalin area, and provides them with the findings of any relevant research and Scientific Committee reports;

FURTHER REQUESTS that the Secretariat makes every effort to actively participate and provide advice and expertise at any international expert panels convened to consider the impacts on the western gray whale of oil and gas development projects in and around Sakhalin Island; and

FURTHER REQUESTS that the Commission request all the range states to develop, begin or continue scientific research programmes on the migration, distribution, breeding, population assessment and other research of the entire range of the western gray whale.

Resolution 2004-2

RESOLUTION ON JAPANESE COMMUNITY-BASED WHALING

WHEREAS, since 1986, the International Whaling Commission has repeatedly discussed in-depth the importance of the history and culture of Japanese traditional whaling at its various working groups and the Commission itself;

WHEREAS the International Whaling Commission, recognising the socio-economic and cultural needs of the four community-based whaling communities in Japan (Abashiri, Ayukawa, Wadaura and Taiji), has repeatedly resolved to work expeditiously to alleviate the distress to the communities which has resulted from the cessation of minke whaling (first, IWC/45/51; most recently, IWC Resolution 2001-6);

WHEREAS, more recently, the Summits of Japanese Traditional Whaling Communities were held in three consecutive years in Japan (Nagato, Yamaguchi in 2002, Ikitsuki, Nagasaki in 2003, and Muroto, Kochi in 2004) and they have further examined the long-lasting whaling history and culture which are deeply rooted in various places of Japan, not only in four community-based whaling communities but also throughout Japan;

WHEREAS the Summits acknowledged that archaeological findings have shown that the ancient Japanese could have started to utilise beached whales at least 9,000 years ago, could have begun active hunting of dolphins and porpoises at least 5,000 years ago, and could have launched grand-scale active hunting of large whales at least 2,000 years ago;

WHEREAS the Summits emphasised that, among others, holding the philosophy and having skills to utilise whales fully was and is the core essence of the Japanese whaling culture;

WHEREAS the Declarations adopted at the Summits (the 2002 Nagato Declaration, the 2003 Ikitsuki Declaration, and the 2004 Muroto Declaration) pledged that Japanese time-honoured whaling traditions and culture are to be passed onto the future generations; and

WHEREAS various UN conventions, treaties, and other documents upheld the importance of sustainable use of natural resources in general and the significance of continued customary resource use for communities;

NOW THEREFORE BE IT RESOLVED THAT THE COMMMISSION:

REAFFIRMS the Commission's commitment to work expeditiously to alleviate the continued difficulties caused by the cessation of minke whaling to the communities of Abashiri, Ayukawa, Wadaura and Taiji, and

ENCOURAGES IWC members to co-operate towards a resolution of this matter.

Resolution 2004-3

RESOLUTION ON WHALE KILLING ISSUES

RECOGNISING that welfare considerations for cetaceans killed for food is of international concern;

NOTING that Article V.1.f of the International Convention for the Regulation of Whaling empowers the Commission to amend the Schedule 'to adopt regulations with respect to the conservation and utilisation of whale resources by fixing … types and specifications of gear and apparatus and appliances which may be used', and that the Commission has exercised this welfare mandate through modification of the schedule and adopting 15 resolutions on welfare aspects of whaling which have established several technical fora for addressing welfare issues;

RECALLING that the IWC has defined 'Humane Killing' as 'Death brought about without pain, stress, or distress perceptible to the animal. That is the ideal. Any humane killing technique aims first to render an animal insensitive to pain as swiftly as technically possible. In practice this cannot be instantaneous in the scientific sense' (IWC/33/15 & IWC/51/12) and that, in order to determine whether these criteria are met, various data must be collected from whaling operations;

FURTHER RECOGNISING that the IWC criteria used to determine death or irreversible insensibility are inadequate; while also recognising that the IWC Working Group and Workshops on Whale Killing Methods are attempting to develop criteria to more adequately determine death or irreversible insensitivity both operationally and from post-mortem approaches;

NOTING that the efficiency of killing methods is influenced by many factors including the calibre of the weapon used, the nature of the ammunition, the target area of the whale, the angle of the shot, the proximity of the whale to the vessel, the accuracy of the gunner, prevailing weather conditions and sea state, including sea ice, and the size and species of the whale targeted;

NOTING FURTHER that data collection requirements are not being met in some hunts, while appreciating that efforts have been made by some member nations to provide available data;

RECALLING that Contracting Parties should make reasonable attempts to release alive, with the minimum harm possible, whales that have been incidentally captured (IWC Resolution 2001-4), but that the Commission has not considered the welfare implications of this practice nor the killing methods that might be employed if the whale cannot be released;

NOTING WITH CONCERN that the number of whales struck in some hunts can have significant welfare implications, while appreciating the efforts of certain member nations, especially Norway, to improve the humaneness of their hunts through weapons improvement programs and increased hunt efficiency;

NOW THEREFORE THE COMMISSION:

EXPRESSES CONCERN, in light of its mandate and long-standing commitment to address welfare issues, that current whaling methods do not guarantee death without pain, stress or distress; that data presently collected and submitted to the Commission are of insufficient quality or completeness for it to make a fully informed assessment of the welfare implications of all whaling operations; and that the criteria currently used to determine the onset of death or irreversible insensibility are inadequate;

REQUESTS THE SECRETARIAT to update the data collection form for the reporting of data in order that contracting governments may report data for each whale taken, the killing method used and samples taken;

REQUESTS the IWC/57 annual meeting to reconvene the Working Group on Whale Killing Methods and Associated Welfare issues, to examine methods for reducing struck and lost rates in whaling operations and to consider the welfare implications of methods used to kill whales caught in nets;

REQUESTS the Working Group on Whale Killing Methods and Associated Welfare Issues to advise the Commission on:

- establishing better criteria for determining the onset of irreversible insensibility and death;
- methods of improving the efficiency of whale killing methods; and
- reducing times to death and other associated welfare issues.

Resolution 2004-4

PROPOSAL TO TAKE INTO ACCOUNT THE SPECIAL POSITION OF VERY SMALL COUNTRIES IN CALCULATING FINANCIAL CONTRIBUTIONS

NOTING that contracting parties should contribute financially to the Commission in a fair and equitable manner;

RECOGNISING that two contracting parties that currently belong to capacity-to-pay Group 3, according to the Interim Measure for calculating contributions, are very small countries with a very small population, and thus a much smaller Gross National Income than the other countries that belong to that Group;

ALSO RECOGNISING that in all other international organisations the special position of these two countries is properly taken into account in the calculation of financial contributions; and

RECOGNISING further that taking account of the special position of these countries within the IWC should not affect the financial contributions of those contracting parties that have the least capacity to pay, and thus belong to Group 1 according to the Interim Measure for calculating contributions;

NOW THEREFORE THE COMMISSION:

DECIDES that, under the Interim Measure for calculating contributions, Monaco and San Marino are transferred from capacity-to-pay Group 3 to Group 2; and

FURTHER DECIDES that this transfer shall have no effect on the contribution of contracting parties that belong to capacity-to-pay Group 1.

Appendix 1

Current Capacity-to-Pay Grouping under 'Interim Contribution Measure'

Group 1	Group 2	Group 3	Group 4
GNI less than $10 billions and GNI/capita less than $10,000	GNI greater than $10 billions and GNI/capita less than $10,000	GNI less than $1,000 billions and GNI/capita greater than $10,000	GNI greater than $1,000 billions and GNI/capita greater than $10,000

Resolution 2004-5

RESOLUTION ON POSSIBLE SYNERGIES WITH THE GLOBAL ENVIRONMENT FACILITY

COGNIZANT of the need to have strong supporting relationships with other international bodies that deal with subject matter with a strong overlapping interest;

RECOGNISING Paragraph 121 of the 2002 Plan of Implementation from the World Summit on Sustainable Development which called for an 'Institutional Framework for Sustainable Development' which would be strengthened by:

> Increasing effectiveness and efficiency through limiting overlap and duplication of activities of international organizations, within and outside of the United Nations system, based on their mandates and comparative advantages.

APPRECIATIVE of the International Whaling Commissions long standing interactions with, *inter alia*, CITES, CMS & CCAMLR;

DESIROUS to support synergies between overlapping conventions so as to improve mutually reinforcing scientific, administrative, policy and financial assistance objectives;

CONSCIOUS of the need to fully support the respective primacy of each organisation;

NOW THEREFORE THE COMMISSION:

DIRECTS the Secretariat to establish high level contact with the Secretariat of the Global Environment Facility and to:

explore possible synergies and their possible utility of the GEF to the IWC, and investigate, *inter alia*, possible avenues for the utilization of GEF funding for IWC related projects, with specific regard to:

(i) assistance for developing countries for scientific research and policies for scientific research, as directed by the IWC;

(ii) the utility in joint projects seeking funding with other international organizations, such as, *inter alia*, the Convention on Biological Diversity, the Convention on Migratory Species, the World Heritage Convention, and the Ramsar Convention on Wetlands;

(iii) an examination of the modalities that the GEF seeks to satisfy and whether IWC projects, now or in the future, could be made to fit such objectives.

The Secretariat shall report back to the 57th IWC meeting on these matters.

Resolution 2004-6

RESOLUTION ON COMPLETION OF THE REVISED MANAGEMENT SCHEME (RMS)

RECOGNISING the dual mandate of the IWC for the conservation of whales and the management of whaling according to the 1946 International Convention for the Regulation of Whaling;

NOTING that on this basis, considerable progress has been made in identifying major elements necessary to reach broad agreement on the RMS, as reflected in the Chairman's Proposal for a Way Forward on the RMS (Doc IWC/56/26);

TAKING NOTE of the comments of Contracting Parties on the Chairman's Proposal at the 56th Annual Meeting of the Commission; and

CONCERNED that the failure to reach broad agreement on the RMS in the near future may seriously jeopardise the ability of the IWC to fulfil its responsibilities;

NOW THEREFORE THE COMMISSION:

COMMENDS the efforts of the Chairman in providing a basis for further work and discussion towards finalising the RMS;

AGREES to re-establish the Working Group on the RMS with a view to holding an intersessional meeting prior to IWC/57, as outlined in the attached Intersessional Plan of Work; and

AGREES to proceed expeditiously towards the completion of both the drafting of text and technical details of the RMS according to the attached Intersessional Plan of Work with the aim of having the results ready for consideration, including for possible adoption, at IWC/57, and/or to identify any outstanding policy and technical issues.

INTERSESSIONAL PLAN OF WORK

The Chair's Proposal for a way forward (IWC/56/26), supplemented by his statement (IWC/56/28), other comments made at IWC/56 in relation to the Chair's proposal and the Secretariat's document (IWC/56/36), provides a basis for the development of draft text for the RMS, to clarify policy and technical issues and draft text for the RMS. The goal of this effort is to have clarified outstanding policy and technical issues and, as far as possible, have finalised text of an RMS package ready for consideration at IWC/57. The following iterative process would occur to develop such a text over the intersessional period:

1. Commission formally revives the RMS Working Group and agrees to establish a small drafting group under it (see respective terms of reference in Appendices 1 and 2).
2. All Contracting Governments are invited to send comments/positions on key issues to the RMS Working Group.
3. Secretariat collates and organises available materials. Technical specialist groups meet and finish their work before December 2004.
4. RMS Working Group to provide guidance on major policy issues to small drafting group (before December 2004).
5. Small drafting group meets (one week) in December 2004.
6. Draft text is circulated to delegations for review and comment. Secretariat circulates comments to all delegations and to members of the small drafting group.
7. RMS Working Group convenes in early March 2005 to consider the draft text and submitted comments and to develop input to the small drafting group for development of the next iteration.
8. The small drafting group meets immediately afterwards to develop the second draft, which the Secretariat circulates to delegates.
9. The RMS Working Group meets for two days during the week prior to the IWC/57 Plenary session to consider the second draft. The results of the RMS Working Group are presented to the Plenary for its consideration at IWC/57.

Appendix 1

Terms of Reference for RMS Working Group

The RMS Working Group will have the following responsibilities:

1. To complete work on the RMS package, with the goal of having a finalised RMS text ready for consideration, including for possible adoption, at IWC/57, and/or to identify any outstanding policy and technical issues.
2. To take account of delegates' comments at IWC/56, as well as written submissions from delegates.
3. To provide guidance to, and to review the work of, the Small Drafting Group.

RMS Working Group to be open to observers.

Appendix 2

Terms of Reference for the Small Drafting Group (SDG)

Under the auspices of the RMS Working Group the SDG will have the following responsibilities:

1. To prepare a consolidated draft text for the replacement of parts of Chapters V and VI of the current Schedule.
2. To prepare consolidated draft text on other related issues in the RMS package.
3. To utilise the Chair's proposal (IWC/56/26) and his statement (IWC/56/28), as a framework for this work.
4. To rearrange, revise and renumber paragraphs in the draft text for Chapters V and VI as appropriate but not to attempt to merge them with other parts of the Schedule.

Representation on SDG and Technical Specialist Groups (TSGs): Chair to seek expressions of interest to ensure regional and policy diversity in the groups. The SDG and TSGs should include Governments with adequate regional coverage, and adequate coverage of those For/Against/Neutral on the key issues.

Resolution 2004-7

RESOLUTION ON THE FREQUENCY OF MEETINGS OF THE INTERNATIONAL WHALING COMMISSION

AWARE that the Rules of Procedure of the International Whaling Commission (IWC) provide for a regular Annual Meeting of the Commission, and that the positions of Chair and Vice-Chair of the IWC shall serve for a period of three years;

NOTING that other international Conventions dealing with fisheries, species, biodiversity and the environment organise their affairs very effectively on the basis of biennial or triennial meetings;

CONCERNED that the costs of the annual meetings of the IWC are increasing from year to year;

NOTING that many Contracting Parties, especially from developing countries, have difficulty in meeting the high costs of attending annual meetings of the Commission;

NOW THEREFORE THE COMMISSION HEREBY DECIDES:

That the principle of meetings of the IWC being held less frequently than regular Annual Meetings be explored;

That, in applying this principle, the intention should be to avoid holding more frequent inter-sessionary meetings as a counter-balancing measure;

That a working group be established by the Commission to investigate and make recommendations on the implications of less frequent meetings of the IWC;

That, in its deliberations, the working group should have particular regard to the implications of less frequent meetings for the term of office of the Chair and Vice-Chair of the Commission; for the work of the other Committees of the IWC; and, with specific regard to the deliberations of the Scientific Committee, that the group should examine whether the current pattern of holding annual meetings should be maintained in the initial years of the new arrangements at least;

That the working group should report to IWC/57 in Ulsan, Republic of Korea.

Annex D

Report of the Sub-Committee on Aboriginal Subsistence Whaling

Wednesday 14 July 2004, Sorrento, Italy

1. INTRODUCTORY ITEMS

The meeting took place at the Hilton Sorrento Palace Hotel, Sorrento, Italy on 14 July 2004. A list of participants is given in Appendix 1. The terms of reference of the Aboriginal Subsistence Whaling Sub-committee are to consider relevant information and documentation from the Scientific Committee, and to consider nutritional, subsistence and cultural needs relating to aboriginal subsistence whaling and the use of whales taken for such purposes, and to provide advice on the dependence of aboriginal communities on specific whale stocks to the Commission for its consideration and determination of appropriate management measures (*Rep. int. Whal. Commn*. 48: 31).

1.1 Election of Chair

Andrea Nouak (Austria) was elected Chair.

1.2 Appointment of Rapporteur

Alexander Gillespie (New Zealand) was appointed as rapporteur.

1.3 Review of documents

The documents for discussion included:

IWC/56/AS1 Revised Draft Agenda.
IWC/56/AS2 Documentation to IWC on Greenland Whaling, 1979-2003.
IWC/56/4 Report of the Small Working Group Reviewing Schedule paragraph 13 Regarding ASW Provisions: Proposals to Amend the Schedule.
IWC/56/Rep 1 Report of the Scientific Committee, Items 8 and 9.
IWC/54/5, Appendix 4. The Aboriginal Whaling Management Procedure - Possible Text. (*Ann. Rep. Int. Whaling Comm.* 2002: 74-75).

2. ADOPTION OF THE AGENDA

The adopted agenda is given as Appendix 2.

3. ABORIGINAL SUBSISTENCE WHALING SCHEME

3.1 Aboriginal Whaling Management Procedure (AWMP)

3.1.1 Report of the Scientific Committee

3.1.1.1 GRAY WHALES (IWC/56/REP 1, ITEM 8.2)

The Chair of the Scientific Committee's Standing Working Group on the Development of an Aboriginal Whaling Management Procedure, Greg Donovan (hereafter Chair of the SWG), reported on the Scientific Committee's work in this regard. Last year, he had informed the Sub-committee that the Scientific Committee expected to be able to recommend a *Strike Limit Algorithm* (*SLA*) for eastern North Pacific gray whales to the Commission at the present meeting. This will be the second *SLA* that the Scientific Committee has recommended in the development process. Because the Committee were making a major recommendation, the Chair of the SWG gave a thorough presentation of the work of the Committee on this issue over the whole development process. The full presentation is available upon request to interested delegations as an electronic file or as a printout of the slides used. He also noted that as in previous years, he is happy to discuss any issues raised with interested parties. What follows is a very short summary of the key points made in the presentation. Full details of the Scientific Committee's work can be found in IWC/56/Rep 1, Item 8 and Annex E.

The Scientific Committee began addressing aboriginal subsistence management procedures in the early 1990s after completion of the RMP. In 1994, the Commission formally instructed the Scientific Committee to work on the development of an aboriginal whaling management procedure (Resolution 1994–4). The Commission had reiterated the objectives of such a scheme as to:

(1) ensure risks of extinction are not seriously increased (highest priority);
(2) enable harvests in perpetuity appropriate to cultural and nutritional requirements; and
(3) maintain stocks at highest net recruitment level and if below that ensure they move towards it.

The advantages (to both the management body and the users) of a management procedure over '*ad hoc*' management were stressed, as was the value of computer simulations to try out potential candidate procedures. The simulation trial structure is designed to test procedures against the inevitable uncertainty in scientific knowledge about the whales and their environment.

The Commission agreed in 1998 that the eventual aboriginal whaling scheme (which includes both the scientific and non-scientific aspects of management) would include both generic and case-specific elements. In particular, it was agreed that *SLA*s (the way in which the need requests forwarded by the Commission to the Scientific Committee are evaluated to determine whether they are acceptable from the point of view of the risk-related objectives given above - it is assumed for the purposes of trials that all strikes result in death) could be case-specific and introduced to the AWS as they became available. The Scientific Committee had agreed that it would proceed with the data-rich fisheries first, i.e. the bowhead and gray whale hunts. In 2002 it proposed the *Bowhead SLA*. Throughout the process, the Scientific Committee placed great emphasis on feedback from the Commission and hunters via the Commission's Aboriginal Whaling Sub-committee, and each year the Chair of the SWG has made a detailed presentation of the development process, requested advice on various matters and been available for consultation with interested delegations and individuals.

The candidate procedures for the gray whale case were tested for a broad range of uncertainty in a variety of factors, including: changes in *MSYR* and *MSYL*; model uncertainty; time dependent changes in carrying capacity, natural mortality and productivity; episodic events; stochasticity; survey bias and variability; survey frequency and errors in the historic catch series. The overall performance of candidate *SLA*s was judged by a combination of an examination of the detailed conservation and need satisfaction statistics for each of the *Evaluation Trials* and *Robustness Trials* and human integration of these results in the context of the relative plausibility each member assigns to the individual trials.

Two procedures performed equally well in the trials, one was the J-B2 and the other was the GUP2[1] based on J-B2 and D-M2 procedures. The Scientific Committee therefore had examined other features that may be used to separate the two *SLA*s. Recalling the discussions about the value or otherwise of the 'unified' (averaging) approach when recommending the *Bowhead SLA*, the Committee noted that the GUP approach includes a built-in check and balance system in that if one of the component *SLA*s behaves poorly for a particular scenario, this effect may be balanced by the other *SLA* and vice versa. Averaging has also been recommended by MCDM[2] experts as an appropriate method. It again followed this philosophical approach and agreed that the GUP2 *SLA* fully met the Commission's management objectives. It also noted that it might be possible to 'polish' the GUP2 *SLA* and its two constituent *SLA*s further. However, the Committee agreed that it should not expend resources unnecessarily in further attempting to achieve some hypothetical level of 'perfection'. It strongly believed that these resources should be dedicated to addressing the serious issue of the Greenland fisheries for fin and minke whales, for which the Committee has never been able to provide management advice.

In conclusion, the Scientific Committee unanimously recommended that the GUP2 *SLA* (hereafter the '*Gray whale SLA*') be forwarded to the Commission. It believes that this *SLA* meets the objectives of the Commission set out in 1994 (IWC, 1995) and represents the best scientific advice that the Committee can offer the Commission with respect to the management of the Eastern North Pacific stock of gray whales.

In making this recommendation, the Scientific Committee noted the integral importance of *Implementation Reviews* to the whole process. Regular *Implementation Reviews* would occur every five years and normally involve at least reviews of information:

(1) required for the *SLA* (i.e. catch data, abundance estimates); and
(2) to ascertain if the present situation is as expected and within tested parameter space.

In addition, to enable swift reaction to new information that gives rise to serious concern, *Unscheduled Implementation Reviews* can be called. He provided a number of examples as to possible 'triggers' for such early reviews. There are a variety of possible outcomes of *Implementation Reviews*, including:

(a) the continuation of use of the *SLA*;
(b) the setting of a zero strike limit;
(c) the running of further simulation trials;
(d) the undertaking of a new census immediately; or
(e) a combination of some of the above.

The Chair of the SWG thanked Eva Dereksdóttir, Kjartan Magnússon, Sue Holloway (neé Johnston) and Doug Butterworth (incidentally all Invited Participants) for the enormous amount of work and thought they had put into the development process. He also specifically thanked Cherry Allison and André Punt for the tremendous support they provided. He noted that this was the second *SLA* that had been developed by the SWG under the auspices of the Scientific Committee and he thanked them as a whole for the atmosphere of co-operation was always been present, even when there are genuine scientific differences of opinion at the various stages of the development process. He believed that a continuation of this mode of working will be essential if the SWG is to address successfully the most difficult case it has faced, that of the Greenland fisheries.

DISCUSSION AND RECOMMENDATIONS

In response to a question from Sweden about what might happen if no surveys occur for longer than a 10-year period, the Chair of the SWG referred to the discussions on the AWS that had been presented two years ago and are available in *Ann. Rep. Int. Whal. Commn*. 2002: 74-75. In summary, the 'grace period' process would be evoked whereby, unless an agreed abundance estimate was forthcoming, then the block limit for the following block would be half that for the present block, after which it would revert to zero. In response to a question from the UK about the appropriateness of the GUP2 approach, the Chair of the SWG reiterated that, as in the case of the *Bowhead SLA*, the Scientific Committee noted that from an MCDM perspective the *Gray Whale SLA* is a perfectly valid approach and it noted the benefits of the inbuilt check-balance by merging two quite different procedures.

In conclusion the Sub-committee endorsed the report and recommendations of the Scientific Committee.

3.1.1.2 GREENLANDIC FISHERIES (IWC/56/REP 1, ITEMS 8.3, 8.4)

The Chair of the SWG reminded the meeting that an urgent need for a Greenland Research Programme had been first identified in 1998. This is primarily due to the lack of recent abundance estimates and the poor knowledge of stock structure. It will be extremely difficult, if not impossible, to develop an *SLA* for the Greenlandic fisheries that will satisfy all of the Commission's objectives without such information. This is particularly important in the light of the Scientific Committee's grave concern at its inability to provide management advice for these fisheries.

He separated out this item into four main issues: stock structure; abundance estimates; biological data and *SLA* development. With respect to the former, the problem was that although the available information suggested that the animals found off West Greenland did not comprise either separate fin or common minke whale stocks, the identity and size of the complete stocks is unknown. The Committee has agreed to follow a two-step process to further the essential work needed to provide information suitable for management; namely an initial simulation study to focus appropriate genetic analyses.

[1] Grand Unified Procedure.
[2] Multiple criteria decision-making.

In this regard, he noted that the Scientific Committee has previously strongly recommended that genetic samples be taken for all of the catch. However, the numbers for 2003 were very low (12 minke whale and 1 fin whale), even though it is mandatory under local regulations to return a sample from each whale that is caught. The Committee expressed disappointment at the lack of progress in obtaining genetic samples, although it noted new procedures were in place. It repeated its strong recommendation that samples for genetic analysis be collected from the catch as a matter of very high priority. It urged the Commission to encourage the Government of Denmark and the Greenland Home Rule authorities to assist with logistical and, if necessary, financial support. Finally, it encourages Greenlandic scientists to investigate other potential sources of samples. It also welcomed the news that some 50 samples are available from the eastern USA and Canada and it urged that these be analysed.

With respect to abundance estimates, the Chair of the SWG noted that, last year, the Committee had strongly recommended that a traditional aerial cue-counting survey be carried out in summer 2003 in Greenland. For logistical and financial reasons it had not been possible to undertake such a survey, but some valuable experimental work had been carried out in 2003 that had been fully discussed. Greenlandic scientists presented a plan for a full aerial photographic (not cue-counting) survey this summer. The Committee had noted the great need for new abundance estimates and, in order to facilitate presentation of appropriate analyses as quickly as possible, had established an intersessional advisory group. The Chair of the SWG noted that the difficult environmental conditions (notably fog and high winds) in Greenland made the undertaking of successful surveys problematic.

The catch data for 2003 were: 6 landed fin whales (2M and 4F), with 3 struck and lost; 178 landed West Greenland common minke whales (58M, 117F, 3 unknown sex) and 7 struck and lost; and 13 landed East Greenland common minke whales (1M, 11F, and 1 unknown sex). An analysis of recent catch data will be provided to the next Committee meeting.

In terms of developing an *SLA*, the Chair of the SWG was pleased to report that three papers, albeit preliminary, had been presented and that these will help to provide a framework for future work. The differences between the relatively 'easy' data-rich cases of the bowhead and gray whales and the data-poor Greenlandic cases, may warrant a different approach to the examination of the trade-off between risk and need satisfaction and the Committee will develop such a statistic to add to the list of those it normally considers. The issues will be considered in depth at the next SWG meeting.

The SWG had also considered how best to proceed with the development of one or more *SLA*s for Greenlandic aboriginal whaling, given the continuing uncertainties about stock structure, abundance, and mixing in the region. One approach would be to postpone *SLA* development until more and better data become available. The SWG rejected this approach, instead believing that *SLA* development was a matter of considerable urgency. The SWG intended to develop the best *SLA*(s) it could given the data available, and noting the potential of the simulation approach to help identify appropriate data collection programmes, it recognised that it might become necessary to improve the *SLA*(s) at future *Implementation Reviews* when more information is available. The Committee had endorsed this approach. The Chair of the SWG advised that issues related to management advice would be presented under later Agenda Items (4.3 and 4.4).

3.1.2 Discussion and Recommendations

After this exchange of views, the Chair summarised that the Sub-committee endorsed all recommendations of the Scientific Committee on these items.

New Zealand stated that what has occurred with regard to data provision by Greenland is unsatisfactory. New Zealand suggested that the Commission has an obligation to probe what has caused this situation and what can be done about it. The annual take of fin and minke whales has created serious difficulties, and Scientific Committee has been unable to provide scientific advice. Despite the Scientific Committee's efforts, very little has been achieved to improve the knowledge of the Greenland stocks. New Zealand was concerned that this year, Greenland reported to the Scientific Committee that they had only provided one genetic sample from six fin whales taken. New Zealand questioned whether it is now time to impose restrictions on the catch quota for Greenland. They then asked Denmark what explanations they had and how they intended to remedy this situation, which given the Scientific Committee advice, is a very urgent one.

Denmark responded that information on the importance of returning samples has been given to the hunters. Only one sample from a fin whale, and 12 from minke whales have been returned in 2003. The Home Rule Government regrets the low number of samples collected. For the 2004 season, letters and phials have been sent to the municipalities, and when issuing licenses, the municipal officers hand out phials to the hunters. The Home Rule Government also works to improve the collection of samples in cooperation with the hunters association and by making a press release, so that the information is conveyed. The UK expressed its concern with this response. The UK recognised that the policing of the hunt was difficult, but stated that the conditions under which ASW is enabled to take place in Greenland are known to the hunters, and were included in licences. The UK felt that non-compliance with conditions required more than a slap on the wrist.

3.2 Aboriginal Whaling Scheme (AWS)

3.2.1 Report of the Scientific Committee (IWC/56/Rep 1, Item 8.2.6)

The Chair of the SWG noted that at the 2002 meeting, the Committee had developed generic scientific aspects of an aboriginal whaling management scheme that would be used in conjunction with the case specific *SLA*s. (These had been reported in detail to this Sub-committee but no agreement had been reached on these by the Commission.) This year, as last, the Committee again recommends these to the Commission. They are specified in *Ann. Rep. Int. Whal. Commn*. 2002: 74-75. The Chair of the SWG will be happy to spend time explaining these further with interested delegations at any time.

3.2.2 Discussion and recommendations

Australia recognised that the focus of discussion was on science, but sought to register its concern over whaling management regimes. This Sub-committee should give equal attention to management considerations as to the scientific considerations. The USA stated that they have previously expressed concerns over certain provisions of the AWS and that their reservations should continue to be noted.

After this exchange of views, the Sub-committee endorsed the recommendations of the Scientific Committee on these items.

4. ABORIGINAL SUBSISTENCE WHALING CATCH LIMITS

4.1 Bering-Chukchi-Beaufort (B-C-B) Seas stock of bowhead whales

4.1.1 Report of the Scientific Committee (IWC/56/Rep 1, Item 9.1)

The Chair of the SWG noted that this year, the Scientific Committee had undertaken an in-depth assessment of the B-C-B bowhead whales. Considerable focus had been given to the question of stock structure and a number of papers were presented that were facilitated by the provision of data under the Committee's new data availability agreement. The Committee agreed that substantial progress has been made in investigating possible stock or population structure among B-C-B bowheads but that there is insufficient information at this stage to fully support or fully refute the hypothesis of a single stock; in fact it is premature to reject any of the hypotheses, or even to draw conclusions about their relative plausibility. The Committee was pleased to receive information on an extensive research programme to address this issue further.

The Scientific Committee also received information on traditional assessment methods, not to provide management advice *per se* but as a way of examining whether 'reality' was still within the parameter space tested in the trial structure of the *Bowhead SLA*. It was noted that stock structure issues applied equally to these methods as to the use of the *Bowhead SLA*.

Catch information was provided for 2003 by the USA: a total of 41 bowhead whales were struck resulting in 35 animals landed. The efficiency (the ratio of the number landed to the number struck) of the hunt was 85%, which is higher than the average efficiency over the past 10 years (77%). Of the 35 landed whales, 17 were females and the sex was not determined for one whale. Of the 17 females, 5 were presumably mature (>13.4m in length). Three of these large females were closely examined; two had recently given birth and the other was not pregnant.

In addition, there was a Russian harvest of three male bowhead whales in Chukotka waters.

In terms of management advice, the Scientific Committee agreed that the future *Implementation Review* of bowhead whales will include stock structure issues as a major component. This *Implementation Review* will examine the robustness of the *Bowhead SLA* with respect to plausible stock hypotheses via simulation trials. If shown to be necessary, this may result in changes to the *Bowhead SLA*. Such an *Implementation Review* will begin at the 2006 Annual Meeting, with a view to ensuring that management advice at the 2007 meeting is based on the best science then available. The Committee also recommended that a report on the progress of the research programme should be provided each year to the Scientific Committee and it encourages cooperative research amongst the various interested research groups.

The Scientific Committee also noted:

(1) the continuing increase in the abundance estimates derived from the census under the recent catch limits and record high calf counts;
(2) the spatio-temporal distribution and opportunistic nature of the hunt and the low numbers of whales struck annually in St. Lawrence Island and Chukotka; and
(3) the development of an extensive research programme that will address questions of stock structure and allow the formulation of one or more plausible stock structure hypotheses.

Given these factors, the Committee agreed that the *Bowhead SLA* remains the most appropriate tool for providing management advice for this harvest, at least in the short-term, and consequently the results from the *Bowhead SLA* (see IWC/56/Rep 1, Item 9.1.4) indicate that no change is needed to the current block quota for 2003-2007.

4.1.2 Discussion and recommendation

The USA noted the collaborative efforts of US scientists with scientists of other countries, particularly Russia, Norway and Japan. They also noted the recommendation of the Scientific Committee on the need for additional research on the bowhead stock identity issue. The USA is committed to undertaking this research so that by 2007, when the bowhead quota is next reviewed, its management will be based upon the best science available at that time.

Japan asked the USA if it could provide Japan with the baleen plates of bowhead whales caught by the Alaskan hunters. In response, the USA agreed to discuss this issue with Japan outside of the Sub-committee. The Russian Federation stated that during this IWC meeting the USA and Russia intend to sign a Memorandum of Understanding and also intend to start work in 2004 on genetic research, as well as biological research. Russia intends to engage in as much joint research as is possible, although it noted that CITES requirements may impose difficulties on what is possible. Switzerland drew the attention of the Sub-committee to the fact that at COP 12 of CITES in Santiago (Chile), a resolution was adopted aiming at facilitating transboundary movement of sensitive biological samples such as scientific research materials for conservation purposes, and that the CITES Management Authorities should be made aware of IWC transboundary issues if the need arises.

After this exchange of views, the Sub-committee endorsed the recommendations of the Scientific Committee on these items.

4.2 North Pacific Eastern stock of gray whales

4.2.1 Report of the Scientific Committee (IWC/56/Rep 1, Item 9.2)

Twenty-two Chukotka aboriginal whaling organisations submitted requests for harvesting a total of 167 gray whales. However, according to permit regulations of the Russian Federation Ministry of Natural Resources, only 135 permits for gray whales were distributed among aboriginal whaling organisations and native settlements. A total of 126 gray whales (70 males and 56 females) were taken in 2003 and two gray whales were struck and lost.

New information on calf counts from the northbound migration and the breeding lagoons in Mexico was presented. The Committee was encouraged to hear that calf production remains at the mid-range of pre-1999 levels (after low levels in 1999, 2000, 2001). In 2002, the Scientific Committee had carried out an in-depth assessment of the Eastern North Pacific stock of gray whales and agreed that a take of up to 463 whales per year is sustainable for at least the medium term (~30 years), and is likely to allow the population to remain above *MSYL*. No information was presented this year to change that advice. The Committee was also pleased to receive the *Gray Whale SLA*, noting that this now represents its best look for providing management advice.

4.2.2 Discussion and recommendations

There was no discussion on this item. The Sub-committee endorsed the recommendations of the Scientific Committee.

4.3 and 4.4 Minke whale stocks and West Greenland stocks of fin whales off Greenland

4.3.1 and 4.4.1 Report of the Scientific Committee (*IWC/56/Rep 1, Item 8.5*)

The Chair of the SWG reported that this was an important issue in the Scientific Committee's deliberations this year. As it has stated on many occasions, the Committee has never been able to provide satisfactory management advice for either the fin or minke whales off Greenland. This reflects the lack of data on stock structure and abundance and is the reason for the Committee to first call for the Greenland Research Programme in 1998. He noted that the Commission's financial contributions to the programme had been aimed at testing the feasibility of large-scale biopsy sampling and satellite telemetry in order to try to obtain information on both abundance and stock structure. Unfortunately, for a number of reasons, these both proved unsuccessful. He clarified that the Commission's funds had not been used towards aerial surveys, noting that these are considerably more expensive than the Commission normally provides funds for.

The Scientific Committee stressed that its inability to provide any advice on safe catch limits is a matter of great concern, particularly in the case of fin whales where the best available abundance estimate dates from 1987/88 and is only 1,096 (95% CI 520-2,100). That for West Greenland minke whales dates from 1993 and is 8,371 (95% CI 2,400 – 16,900).

Obtaining adequate information for management must be seen as of very high priority by both the national authorities and the Commission. The Committee urged the Commission to encourage the Government of Denmark and the Greenland Home Rule authorities to provide the necessary logistical and financial support. Without such adequate information, the Committee will not be able to provide safe management advice in accord with the Commission's management objectives, or develop a reliable *SLA* for many years, with potentially serious consequences for the status of the stocks.

The Scientific Committee recommended that every effort be made to ensure that the number of samples collected from the catch in 2004 will be very considerably higher than in 2003 and close to 100%. It also strongly recommended that these and all existing samples held in Greenland be analysed as soon as possible in accordance with guidance to be given by the intersessional working group.

The Scientific Committee drew attention to the grace-period provision that it had agreed previously in the context of a general aboriginal whaling scheme (although it has not yet been accepted by the Commission) associated with agreed *SLA*s. As shown in IWC/54/5 Appendix 4, under such a provision, catch limits would begin to be phased out 10-14 years after an abundance estimate was last obtained and catches would revert to zero at the end of the five-year period during which the catch limit would have been half the previous block. The Committee has not previously suggested that such a grace-period should have started for fin whales. However, it drew attention to the fact that if it had, such a period would now be nearing completion.

It is with great concern that the Scientific Committee advised the Commission that in the absence of an agreed abundance estimate for fin whales arising out of the 2004 survey, it will likely recommend immediately that the take of fin whales off West Greenland be reduced or eliminated. If, as hoped, an abundance estimate is obtained, the Committee will review this next year in its formulation of management advice.

4.3.2 and 4.4.2 Discussion and recommendations

The Chair summarised that the situation is serious especially for fin whales, and that a reduction of the quota might be considered.

With regard to the financial questions, Denmark explained that the Home Rule Government has given financial support for survey projects between DKK 1.2-1.4 million annually for the years 2002-2004. Between 1998-2003, a total of 301 samples have been collected making it about 50 per year. 166 samples have been analysed in 2003. There are 200 samples in the freezers to be analysed. Results from the samples have been published in the *Marine Ecology Progress Series*. There has been disappointingly little discussion of these results in the SWG, but Greenland hopes to receive some guidance from the SWG on the best directions for future analyses. Greenland is therefore looking forward to a project to be undertaken this winter, in cooperation with the SWG. A simulation study of possible connections between minke whale stocks will provide guidelines that will guide the analysis of the samples in the freezers and the coming samples. On the question of reduction of the current quota of fin whales, Greenland suggested that the Scientific Committee is not the right body to decide such a reduction. Greenland suggested it would be strange if quotas would be reduced due to bad weather this August and expressed their hope that the weather was with them in August. In conclusion, the Greenland Home Rule Government stated that it intended to increase its efforts to gain more samples as recommended in cooperation with the hunters organisation. The UK noted Denmark's remarks with interest but stated that this was not the first time this problem had arisen. The Scientific Committee recommendations were in the strongest terms the UK had seen. The UK felt that the Commission would need to agree to take action on the quota if data were not made available. Australia concurred with the UK in noting that the Scientific Committee wording was unprecedented, and suggested that the Scientific Committee concerns should be reinforced by this Sub-Committee.

Argentina expressed concern because the sex ratio of the Greenland's minke hunt is highly female biased: on average, 72% of all minke whales killed in Greenland since 1986 were female. Argentina asked Greenland why it believes the bias occurs and what might be the solution to this problem? Denmark answered that this kind of question has been raised before. Nevertheless, they explained again that sex selection is impossible to enforce in Greenland due to both weather and ocean conditions.

New Zealand questioned whether the answer given by Denmark was sufficient. They noted that the information given showed a high female sex bias (72% for all minke whales caught in Greenland and 92% for East Greenland minke whales since 1996). New Zealand was concerned that the preferential removal of females could significantly affect the regenerative capacity of the stock. It would be helpful for Greenland to provide information on the date, location and sex of every whale taken, to show precisely what is going on. These issues raise fundamental questions of accountability that go to the centre of the integrity of the legal instrument under which the Commission operates. The time for accountability has arrived.

Germany stated that more information about what was going on was required, and were appreciative that this matter will be followed up next year. They also appreciated the strong recommendations given by the Scientific Committee relating to the failure of abundance estimates. Germany suggested that this is clearly a matter which the Commission has to follow up on.

The UK expressed its concern about sex bias, and remarked that if a degree of sex bias was inevitable, it raised some very important questions about the sustainability of the hunt. Switzerland agreed with the UK, suggesting that if the harvest is overtly biased on females, questions of sustainability must arise.

With respect to the female bias in the catch, the Chair of the SWG clarified that it is common for minke whales to segregate both geographically and temporally by sex in the North Atlantic. The sex bias in the catch is longstanding and earlier attempts to model the animals off West Greenland showed that if the minke whales found there comprised a complete stock they would already have become extinct. The sex bias in the catch probably reflects the sex ratio in the waters there and not any selectivity by whalers (which in any case is not possible). He noted that the Committee was expecting a paper on recent catches (both geographical and temporal by sex) at its next meeting.

Greenland explained that the information on the seasonal distribution of the harvest suggests northward movement in early part of hunting season and a southern movement in the autumn, so that the hunting season, which is in any case short, is even shorter in the northern part of the area of distribution of minke whales in West Greenland. Analysis has not so far shown differential distribution of the two sexes. They suggested that knowledge of this bias is long standing and not recent. This bias suggests that this is probably a part of a larger stock, whose boundaries are uncertain.

After this exchange of views, the Sub-Committee endorsed the recommendations of the Scientific Committee on these items.

4.5 North Atlantic humpback whales off St. Vincent and The Grenadines

4.5.1 Report of the Scientific Committee (IWC/56/Rep 1, Item 8.6)

The Chair of the SWG reported that in recent years, the Scientific Committee has examined the stock structure of humpback whales in the North Atlantic. It is most plausible that the animals from St. Vincent and the Grenadines are part of the West Indies breeding population (ca. 10,750 in 1992). However, further data to confirm this are desirable and the Committee repeated previous recommendations that every effort be made to obtain photographs and genetic samples from St. Vincent and the Grenadines. The Scientific Committee was disappointed not to receive information on whether or not any catches had been taken last year. There were no scientists from St. Vincent and the Grenadines present at the meeting and no national progress report had been submitted. However, it noted that the genetic analyses of at least three samples from caught animals is being conducted. It was also pleased to hear that sightings cruises are taking place in the region and looked forward to receiving a report in the future.

The Commission has adopted a total block catch limit of 20 for the period 2003-2007. The Scientific Committee agreed that if the humpback whales are part of the West Indies breeding population, this catch limit will not harm the stock.

4.5.2 Discussion and recommendations

The UK did not dispute the Scientific Committee recommendations, but urged the need for further data. The UK suggested that if not identified as part of the West Indies stock, there could be ramifications on the stock. Australia understood that St. Vincent and the Grenadines passed new whaling regulations in December 2003, and asked whether a copy of this legislation had been submitted to the Secretariat as is required, and whether it had been found to be consistent with the draft legislation presented to the IWC. The Chair of the SWG indicated that this matter was usually dealt within in the Infractions Sub-committee, but he would investigate this situation. The Chair noted that St. Vincent and the Grenadines were not present.

5. SCHEDULE PARAGRAPH 13

The Chair drew attention to Document IWC/56/4 and asked the Russian Federation to introduce the item. The Russian Federation explained that at IWC/55 in Berlin last year, they had drawn attention to what it considered anomalies in the way that the Chukotka peoples are treated compared with other aboriginal groups and proposed changes to the Schedule to address these inconsistencies. However, after discussions within the Aboriginal Subsistence Whaling Sub-committee and in the Commission, the Russian Federation agreed to withdraw its proposed Schedule amendments and to work intersessionally on this issue. To this end, the Commission agreed that a small group (comprising of the Russian Federation, Denmark, Australia and the USA, working with the Secretariat) should work intersessionally by email to review Schedule paragraph 13 to determine how consistency in approach to ASW operations could be achieved and to propose a Schedule amendment for review and decision-making at IWC/56. A report from this group, together with proposed Schedule revisions is available as IWC/56/4.

The SWG agreed that all the provisions governing aboriginal subsistence whaling operations are understood to be, and should be, included in paragraph 13 of the Schedule. Should the Commission decide to harmonise the ASW Schedule language, the group recommends considering the creation of one option concerning the prohibition on the taking of calves and whales accompanied by calves. A new sub-paragraph could be inserted in the general principles governing this form of whaling to read as follows:

> '13. (a) (4) It is forbidden to strike, take or kill calves or any whale accompanied by a calf.'

The Small Group agreed that nothing in the Russian Federation's proposal to amend Schedule paragraph 13 was intended to allow for commercialisation of aboriginal subsistence whaling. The native peoples never harvested whales for commerce. The native peoples use the predominant portion of the products for their own needs and only an insignificant part is exchanged or used for transactions with other communities.

The words 'when the meat and products of such whales are to be used exclusively for local consumption' in sub-paragraphs 13(b)1, 13(b)2, 13(b)3 and 13(b)4 means that some transaction beyond the aboriginal whaling communities under the current Schedule language are acceptable. The definition of aboriginal 'subsistence use' was adopted by the Cultural Anthropology panel of the IWC Meeting of Experts on Aboriginal/Subsistence Whaling in February 1979 (IWC Special Issue 4, 1982) and provided that:

(1) the personal consumption of whale products for food, fuel, shelter, clothing, tools or transportation by participants in the whale harvest;
(2) the barter, trade or sharing of whale products in their harvested form with relatives of the participants in the harvest, with others in the local community or with persons in locations other than the local community with whom local residents share familial, social, cultural or economic ties. A generalised currency is involved in this barter and trade, by the predominant portion of the products from such whales are ordinarily directly consumed or utilised in their harvested form within the local community; and
(3) the making and selling of handicraft articles from whale products, when the whale is harvested for the purposes defined in (1) and (2) above.

The Russian Federation indicated that the words '…the aborigines whose traditional aboriginal subsistence and cultural needs have been recognised,' in sub-paragraph 13(b)(2) is not related to the right of native peoples in taking gray whales, but, rather, to the right of native peoples in using harvested gray whales. These kind of limitations in the use of meat and products of whales do not exist in the other sub-paragraphs of Paragraph 13. A representative of the Chukotka native peoples explained that the existing condition leads to paradoxical situations where in different villages, even in the same village, and even for the same person, people have different rights in using legally harvested gray and bowhead whales. This situation violates human rights and discriminates against native peoples of Chukotka.

It was agreed by the Small Group that aboriginal communities in Chukotka, which have a quota to take gray whales and bowhead whales, have equal rights to other aboriginal communities that have Aboriginal Subsistence Whaling quotas to use the meat and products of these whale species.

The Small Group noted that the proposal to delete the words – 'whose traditional aboriginal subsistence and cultural needs have been recognised' – from Schedule sub-paragraph 13(b)(2) was intended to reflect this equality of rights.

The Russian Federation noted that any limitations of human rights of entire peoples, especially minority native peoples, are an extremely delicate question, with great ethical and political implications. In relation to these issues, the Russian Federation asked the delegations of Contracting Governments to be politically correct in their discussion, and expressed a preference that the ASW Sub–committee recommend that the Commission include an item on its agenda to adopt the Report of the Small Group and adopt the proposal to amend the Schedule paragraph 13 by consensus.

5.1 Discussion and recommendations

The Chair summarised that the proposal suggests a new Para 13(a)4, a deletion of the relevant sentences in Para 13(b) as well as the deletion of the phrase 'whose traditional aboriginal subsistence and cultural needs have been recognised'.

The USA thanked the Russian Federation for their leadership of the small group. They noted that although the group represented different views, they had reached consensus on the report, and encouraged the Sub-Committee to accept the report in the same spirit. The UK congratulated the Small Group on its work. Although the UK generally had no difficulty with the report it was uneasy about the suggested solution. The UK fully accepted that the rights of Chukotka people should be exactly the same as other indigenous peoples, regardless of the whales taken, but stressed the obligation to ensure that for ASW operations the products are in large measure, or totally, used for the people whose needs have been acknowledged. As such, the UK would be inclined to delete the 'objectionable' part from the end of the paragraph, and put it at the top of the section, so as to apply equally to all indigenous whaling operations. Australia emphasised the need for the Russian Federation to explain to the Commission precisely how the current Schedule provisions discriminate against the native peoples of Chukotka in practice. Australia also pointed out that recommending adoption of the report, is not the same as accepting the Schedule amendments.

Grenada expressed support for the proposal by the Russian Federation in as much as it is aimed at producing a more uniform code for ASW, thereby qualifying equality and respecting human rights for each of the four ASW operations. However, with regard to the stated aim of providing equality of rights the wording of the proposed Amendment of the paragraph 13 of the Schedule, Grenada wondered why only St. Vincent and the Grenadines of the four ASW operations is required to conduct whaling according to national legislation. Does this mean that the other three ASW schemes are not required to follow national laws? The Chair of the SWG replied that it was his understanding that all nations have to enact national laws, in accordance with the Convention. Grenada then stated that in the interests of uniformity, fairness and human rights either the sentence singling out of St. Vincent and the Grenadines should be deleted, or the requirement to whale according to national legislation should be inserted into the appropriate subsections of paragraph 13 (b)(1),(2) and (3) for each of the four ASW schemes.

Austria raised a question of clarification on the striking of the phrase 'whose traditional aboriginal subsistence and cultural needs have been recognised.' Whilst it may be correct to strike that here, where does this sentiment remain anchored in the International Convention for the Regulation of Whaling (ICRW)? Does striking it mean that all future, new applications for aboriginal quotas no longer need to demonstrate that they fulfil these criteria? New Zealand agreed with Austria and felt that Russia had made a compelling case, and that Russia ought not to be subject to the problems outlined here. The issue, however, is whether the current proposed drafting will provide the required results. New Zealand suggested that a possible solution would be to place the phrase on the recognition of need at the top of paragraph 13, as an over-riding principle for all IWC-approved ASW operations. New Zealand stated that the recognition of cultural need was at the heart of the aboriginal whaling, and that the language that it was proposed to delete had been included as a result of the Makah quota request and was needlessly confused by the allocation of a block quota.

The USA responded to the intervention from the UK by stating that the phrase in question is not necessary, and the position of the USA is that the Commission itself recognizes needs when it approves a quota request. The USA noted, in response to the intervention by New Zealand, that the Commission recognised the needs of the Makah Tribe in both 1997 and 2002 when it approved requests for quotas put forth on their behalf.

The Republic of Guinea expressed their support for the Russian Federation's proposal. Australia explained that it was their understanding that appropriate tests of need should continue be applied. Japan stated that it could support the sentiments contained in the proposal but had some questions on it. The first question was why the proposed 13(a)(4) states 'any whale accompanied by a calf'. It should, in the Japan's view, be 'female' whale. The second question was how to define the cultural needs. It stated that Japan has long-standing cultural needs for whales dating back to 9,000 BC and that those needs had been satisfied through commercial whaling and are being satisfied to some extend by the byproducts from research whaling activities which is perfectly legal under the ICRW. Australia noted the fine balance of this report, and the need to treat this matter with some delicacy. Australia suggested that the proposals by Japan could upset this balance. Benin expressed their support for the Russian Federation and invited the Committee to review the proposals of the Russian Federation.

The Chair concluded that the Sub-Committee takes note of the report IWC/56/4 and records that the issue had not been fully resolved. She reminded the Sub-Committee that the Russian Federation's new proposal is a Schedule Amendment and has to be officially proposed in the Plenary to be either adopted by consensus or, if this is not possible, a three quarters majority vote.

The Russian Federation did not agree with the Chair's conclusion and qualified that the issue was resolved in the Sub-Committee.

The Small Group recommended that the report and the proposal to amend the Schedule be put forward to the Plenary. The Sub-Committee supported this recommendation.

While there may not have been consensus in the Sub-Committee, the Russian Federation pointed out that based on the interventions there seemed to be agreement that there exists a problem of unequal rights among native people and that this problem should be resolved. The Russian Federation noted that since this is an aboriginal subsistence issue it should be resolved by consensus and that no one should provoke voting on an aboriginal question. The UK stated that it had not proposed the additional sentence(s), merely that between now and Plenary, it would need to reflect on whether they were necessary or not.

Australia pointed out that despite these discussions, there is no disagreement with the report. Australia further noted that no alternative text has been put forward for the report itself. Nonetheless, it was still an open question whether members should support a Schedule amendment text.

Japan raised the question why St. Vincent and the Grenadines were not represented on the Small Working Group. Australia explained this was because it was a small volunteer group, and St. Vincent and the Grenadines had not volunteered.

The Chair repeated that the issue will have to be brought forward to the Plenary and recommended that the respective countries meet to discuss some of the proposed modifications before the Plenary.

6. OTHER MATTERS

There were no other matters raised.

The Chair thanked the Sub-committee for its constructive and efficient work.

7. ADOPTION OF REPORT

The Report was adopted at 17:00 on Friday 16 July 2004 by correspondence.

AGENDA

1. Introductory items
   - 1.1 Appointment of Chair
   - 1.2 Appointment of Rapporteur
   - 1.3 Review of documents
2. Adoption of the Agenda
3. Aboriginal Subsistence Whaling Scheme
   - 3.1 Aboriginal Whaling Management Procedure (AWMP)
     - 3.1.1 Report of the Scientific Committee
     - 3.1.2 Discussion and recommendations
   - 3.2 Aboriginal Whaling Scheme (AWS)
     - 3.2.1 Report of the Scientific Committee
     - 3.2.2 Discussion and recommendations
4. Aboriginal subsistence whaling catch limits
   - 4.1 Bering-Chukchi-Beaufort Seas stock of bowhead whales
     - 4.1.1 Report of the Scientific Committee
     - 4.1.2 Discussion and recommendations
   - 4.2 North Pacific Eastern stock of gray whales
     - 4.2.1 Report of the Scientific Committee
     - 4.2.2 Discussion and recommendations
   - 4.3 Minke whale stocks off Greenland
     - 4.3.1 Report of the Scientific Committee
     - 4.3.2 Discussion and recommendations
   - 4.4 West Greenland stock of fin whales
     - 4.4.1 Report of the Scientific Committee
     - 4.4.2 Discussion and recommendations
   - 4.5 North Atlantic humpback whales off St. Vincent and The Grenadines
     - 4.5.1 Report of the Scientific Committee
     - 4.5.2 Discussion and recommendations
5. Schedule Paragraph 13
6. Other matters
7. Adoption of the Report

Annex E

Chair's Proposals for a Way Forward on the RMS

SUMMARY OF CHAIR'S PROPOSAL FOR AN RMS 'PACKAGE'

A small group comprising myself [Henrik Fischer], Denmark, Iceland, Japan, the Netherlands, Spain, Sweden, the USA and the Secretariat met twice in Cambridge. Based on the very constructive discussions held, I would like to bring a proposal forward for consideration by the whole Commission on how to take us forward towards an RMS. I believe that an effective RMS is essential both for the wise management and conservation of whale stocks; the present stalemate is not conducive to either.

The proposal included in this document and summarised below is based on the principle of compromise and respect of the various viewpoints held by Commission members within a framework that ensures that the rules and regulations of the Commission are obeyed and seen to be obeyed in an efficient and cost-effective manner. This will involve use of both the Schedule and voluntary measures such Resolutions and codes of conduct (issues requiring Schedule text are shown with an asterisk below).

ELEMENTS OF A PROPOSED RMS 'PACKAGE'

1. **RMP*:** as agreed by the Scientific Committee and endorsed by the Commission.
2. **A phased-in approach to the resumption of commercial whaling*:** for an initial period (e.g. 5 years after the lifting of the moratorium), commercial whaling would only be allowed in waters under national jurisdiction.
3. **National inspection and observation scheme*:** as proposed by the EDG (generally, observers and inspectors on all boats where practical) with VMS on very small vessels with < 24hr trips and one observer per catcher attached to a factory ship.
4. **Additional catch verification to combat IUU whaling and/or unreported bycatches (NOT to monitor trade):**
   - national diagnostic DNA registers and market sampling to agreed standards (with outside review) and a procedure to allow checking of samples against the registers;*
   - resolution urging countries to institute national legislation prohibiting the import of whale products from non-IWC countries as well as from IWC countries that are non-whaling; and
   - documentation up to port of entry if importation from IWC member *.
5. **Compliance*:** Compliance Review Committee with duties as developed by the RMS EDG and agreed by the Commission, and inclusion of Schedule text as proposed in Berlin:

   'The Compliance Review Committee reports on infringements and the seriousness of these infringements to the Commission and advises the Commission what actions, if any, to be taken'.

6. **Mechanism to apportion RMS costs among Contracting Governments*:** costs for national activities should be borne by relevant national governments, while international costs for securing transparency could be allocated in the context of the overall financial contributions scheme.
7. **Measures for the lifting of Paragraph 10(e)*:** modify paragraph 10(e) such that it becomes invalid on a specific day whilst ensuring that any whaling operations are undertaken under the full RMS package (N.B. catches other than zero can only be set for species/areas the Scientific Committee provides advice for under the RMP – currently very few).
8. **Whaling under Special Permit:** recognise that it is a Sovereign right under the Convention but develop a Code of Conduct.
9. **Animal welfare considerations:**
   - Explicit recognition of the issue in the Schedule*:

     'The hunting of whales shall be undertaken so that the hunted whale does not experience unnecessary suffering and so that people and property are not exposed to danger.'

   - Resolution focusing on improving techniques, voluntary provision of data to regular scientific workshops and possible co-operative research programmes.

This 'package' of measures includes, in some way, all but two of the elements that have been discussed recently in the context of the RMS. The exceptions are blanket trade restrictions and sanctuaries. While some form of trade restriction might be appropriate in deterring IUU whaling, I believe that a blanket ban on international trade in whale products would be discriminatory against some countries, against principles of free trade, and outside the competence of IWC. With respect to sanctuaries, each should be reviewed on its own conservation and management merits and would therefore be difficult to build into any RMS 'package'.

If the Commission reacts favourably to my proposals in Sorrento, recognising that they are of course open to discussion, then I believe it should be possible to have firm proposals ready for adoption at the meeting in 2005. This will however require substantial intersessional activity of both a technical and policy nature.

PREFACE TO CHAIR'S PROPOSALS – WHY AN RMS IS NEEDED

The 1946 International Convention for the Regulation of Whaling clearly gives IWC a dual mandate, i.e. both the conservation and the management of whaling and whale stocks; these are not mutually exclusive but directly inter-related. It is for the following reasons that I believe that an RMS is essential for the credibility of the IWC.

It is a fact that whales are being caught by some IWC members. While recognising and respecting the different views on whaling held by member nations, from the point of view of conservation and wise management, it is best that whaling is managed using a scientific, consistent and fair approach. The highly migratory behaviour of the large whales makes international co-operation on management essential and the IWC is best placed to fulfil this management role. However, at present our organisation is not generally seen to be working effectively and indeed the present polarised views and actions are, I believe, detrimental to conservation.

The IWC Scientific Committee spent several years developing the RMP - the most advanced method for the conservation and management of a natural resource. This procedure was developed specifically for baleen whales with the aim of maintaining all whale stocks at healthy levels and avoiding the problems identified with past scientific management approaches, particularly by taking scientific uncertainty specifically into account in accordance with the Precautionary Principle. As already mentioned, this approach was agreed by the Commission in 1994 but has not yet been implemented. If implemented today, the RMP would only allow catches of some stocks of minke whales. It would not result, contrary to popular opinion in some countries, in a 'free for all' on all stocks of all whale species.

As has been recognised since at least 1992, effective conservation and management measures developed using the RMP must be accompanied by a modern supervision and control system (i.e. the RMS) that ensures that those measures are not only obeyed, but are seen to be obeyed. However, despite some nine years of discussions, agreement on the RMS has still not been reached.

I strongly believe that if the IWC is to fulfil its role in the conservation and management of whale stocks and to avoid past errors, real effort must be made to complete the RMS expeditiously. To do this parties must respect the views of others, and in that light, develop a package of measures that is as broadly acceptable as possible whilst meeting the agreed objectives in the most practical and cost effective manner. Building on the progress made in a number of important areas and working in good faith, it should be possible to rapidly complete this work, thereby ensuring the conservation and management of whale stocks for the future, restoring the credibility of the IWC as an effective organisation and providing an example of how modern natural resource management should be carried out. Failure to put an RMS in place will jeopardise the future of the IWC and serves neither the interests of whale conservation nor management.

CHAIR'S PROPOSALS FOR A WAY FORWARD ON THE RMS

1. INTRODUCTION

Following the adoption of the 'moratorium' on commercial whaling in 1982, that came into effect in 1986, the Scientific Committee spent several years developing the Revised Management Procedure (RMP). The RMP is a conservative scientific method for determining safe catch limits that explicitly takes scientific uncertainty into account. The Commission adopted the RMP in 1994, but agreed that it would not be implemented until a Revised Management Scheme (RMS) was completed. In addition to the RMP, the RMS was to include measures to ensure that regulations were obeyed, primarily via an updated and revised national inspection and International Observer Scheme (IOS). Subsequent discussions of what the RMS should contain have included the need for catch verification measures in addition to those within an IOS and the collection of animal welfare data. Additionally, related issues such as limiting catches to waters under national jurisdiction, trade restrictions, scientific permits, sanctuaries and the relationship between completion of the RMS with Schedule paragraph 10(e) have also been discussed – many of these having been introduced as part of the 'Irish Proposal' brought forward in 1997 as a way to help overcome the impasse that developed within IWC following adoption of the moratorium.

Many Contracting Governments have spent considerable time and effort over the years on RMS discussions. Despite the fact that progress has been made in some areas, particularly with the inspection and observation scheme, there has been no progress in others and hence no overall agreement. This has led to increasing frustration among Contracting Governments and accusations as to who was responsible for the delay. At last year's Annual Meeting in Berlin, a private meeting of Commissioners was neither able to make recommendations regarding possible components of an RMS or on how to take the RMS process further.

During the plenary meeting, the Commission did, however, agree to my proposal to convene a small group of my choosing to explore ways and possibilities of taking the RMS process forward. I subsequently invited Denmark, Iceland, Ireland, Japan, the Netherlands, Spain, Sweden and the USA to take part. All except Ireland were able to accept. Ireland had to decline due to pressures of work associated with the lead-up to Ireland's presidency of the EU starting January 2004.

The 'Chair's Small Group' (CSG) met at the Secretariat's offices in December 2003 and again in March 2004. The discussions were very productive and based on their outcome, I would like to bring some thoughts and proposals forward for consideration by the whole Commission. I was heartened that the CSG operated in a spirit of openness with a desire to understand the differing points of view on RMS-related issues, without assigning dishonest or underhand motives where there was disagreement. All recognised the current problems within the Commission stemming from a lack of mutual trust and agreed that it was vital that these are overcome if the Commission is to fulfil its mandate. Similarly, there was widespread recognition that all must be willing to compromise to reach an agreement that is broadly acceptable; any compromises must of course still enable the objectives of the RMS (see below) to be met.

In the Preface to this document, I have explained why I believe an RMS is needed. In the following pages I reiterate the framework and objectives against which an RMS should be developed, review the major obstacles to completing the RMS that remained at the Berlin meeting, including general ideas on how they might be overcome, outline a possible RMS 'package' and touch on possible next steps. I use the phrase RMS 'package' since it is clear from past discussions that resolution of the RMS will necessarily involve the inclusion of some elements not strictly related to ensuring that regulations are obeyed and seen to be obeyed.

2. THE FRAMEWORK AND OBJECTIVES FOR DEVELOPING AN RMS

For several years leading up to and including the meeting of the RMS Working Group at IWC/53 in London, discussions on the RMS had focused on trying to make progress largely through revisions to draft Schedule language (i.e. a 'square bracket exercise'). This meant that Schedule language was debated in isolation rather than within a framework looking at the RMS as a 'whole'. This approach changed with the establishment of the Expert Drafting Group (EDG) at IWC/53 when a framework was developed that established objectives for an RMS. This framework has provided an objective way to develop and evaluate proposals, and has been instrumental during the development of the proposals I outline in this document.

The EDG framework

The EDG agreed that the primary objectives of any IOS scheme are to:

(1) ensure that the rules and regulations of the Commission are obeyed;
(2) ensure that the rules and regulations of the Commission are seen to be obeyed;
(3) report to the Contracting Government any infractions of those rules and regulations; and
(4) report to the Commission any infractions of those rules and regulations.

In developing a scheme to meet these objectives, account must be taken of:

(1) certain desired features of any credible combined scheme, including that it be to the extent possible robust, independent, transparent and based on best practice;
(2) the need for the scheme to be as simple, practical and cost-effective as possible, concomitant with meeting its objectives; and
(3) the nature of likely future operations (whilst noting that any scheme must be sufficiently generic to be able to incorporate new vessels, etc. without modification).

The following progression was used to structure its discussions:

(1) identify the nature of the regulation or information required;
(2) determine appropriate method(s) to monitor the regulation;
(3) assess efficiency and practicality of method(s);
(4) select most appropriate;
(5) determine whose responsibility to ensure method is used and who uses it;
(6) determine reporting hierarchy; and
(7) determine who pays.

Using this approach, the drafting of Schedule text is left until considerable agreement has been reached on a particular issue or indeed on the whole RMS 'package'.

3. OBSTACLES TO COMPLETING AN RMS AND HOW THEY MIGHT BE OVERCOME

The elements that have been discussed as possible components of an RMS and related issues are given in the table below. The status of discussions on all elements and issues as of the 55th Annual Meeting in Berlin is summarised in Document IWC/56/COMMS 3.

Main potential elements of the RMS

Scientific

RMP – including:
- survey guidelines; and
- total catches over time.

Non-scientific

Chapter V: Supervision and Control:
- vessels, points of landing, processing plants;
- national inspection schemes;
- International Observer Scheme;
- verification of catch data;
- costs; and
- oversight/compliance.

Chapter VI: Information Required:
- scientific information; and
- animal welfare data.

Related issues under discussion
- relationship with paragraph 10(e);
- limiting catches to national waters;
- trade restrictions;
- Special Permits; and
- sanctuaries.

There is consensus within the Commission that the RMS should at least include the RMP (including the agreed survey guidelines[1] and together with provisions to adjust catch limits to account for other human-induced mortalities to ensure that removals over time do not exceed limits set

[1] In Resolution 1996-6, the Commission agreed to accept as a component part of the RMS the *'Requirements and Guidelines for Conducting Surveys and Analysing Data within the Revised Management Scheme'*. Since then, the Guidelines have been revised slightly by the Scientific Committee and the RMP text has been revised to include the following paragraph: the only estimates of abundance acceptable for use in the *Catch Limit Algorithm* are those obtained in accordance with the most recent version of the *'Requirements and Guidelines for Conducting Surveys and Analysing Data within the Revised Management Scheme'*.

by the RMP[2]), an inspection and observation scheme, some form of compliance monitoring and a mechanism to apportion costs of any RMS among member countries. However, lack of agreement remains concerning not only the details of some of these 'agreed' elements (particularly the cost-sharing arrangement) but also on which other elements should be included as part of the 'package'.

The major obstacles now remaining are:

- the relationship between the RMS and Paragraph 10(e);
- whether additional catch verification measures beyond those provided by the inspection and observation scheme are necessary;
- how RMS costs should be apportioned among member countries;
- whether commercial catches should be limited (at least initially) to waters under national jurisdiction;
- whether restrictions should be placed on international trade;
- whether animal welfare data should be collected;
- whether there should be any link/relationship between the RMS and special permits; and
- whether there should be any link/relationship between the RMS and sanctuaries.

Section 3 below summarises the status of discussions on these particular issues up to and including IWC/55 and presents ideas emerging from discussions within the CSG on how obstacles may be overcome.

3.1 The RMS and Schedule paragraph 10(e)

The issue

The most important obstacle revolves around the relationship between the RMS and Schedule paragraph 10(e). To date the views expressed on this relationship have ranged from:

(1) agreement on the RMS should result in simultaneous deletion of paragraph 10(e) from the Schedule and catch limits other than zero should be established based on the advice of the Scientific Committee; to

(2) even though an RMS is agreed, paragraph 10(e) should remain until such time as the Commission takes action to remove it.

Rationales for these opinions varied from the view that an RMS is meaningless if no whaling is allowed on stocks for which the RMP would set a catch limit other than zero, through a lack of trust that countries may object to one or more provisions of an RMS and thus not be bound by them, to the view that whaling should not be allowed but that an RMS should be in place in case a three-quarter majority is in favour.

Towards resolution

Aside from the view of some member governments that commercial whaling is always unacceptable, the primary concern that has been expressed is that if adoption of the RMS is simultaneous with the lifting of the moratorium, there is a possibility that a whaling nation might exercise its right to object to one or more of the RMS provisions and thus be able to whale legally but outside the RMS. However, as noted at the October 2002 private Commissioners' meeting on the RMS, practical ways to address this concern can be found, e.g. the addition of a clause to paragraph 10(e) such that it becomes invalid on a specific day, provided that no objections to the RMS provisions have been received. During discussions within the CSG, there was a general feeling that a simple provision that meant that even a single objection (be it from either a pro- or anti-whaling country) could frustrate a widespread agreement to the twin objectives of lifting paragraph 10(e) and ensuring that whaling occurs under a full RMS was not acceptable. Further thought is needed to design a provision that ensures that these twin objectives are met.

3.2 Catch verification

The issue

The National Inspection and International Observer Scheme (IOS) as foreseen by the EDG (IWC/54/RMS 1) will provide for the checking of catches taken by authorised vessels under the jurisdiction of IWC member countries. However, some governments have proposed that additional catch verification measures, such as DNA registers/market sampling and/or catch documentation are necessary. At the October 2002 private meeting of Commissioners, it was noted that some form of catch verification can provide additional valuable information in the context of:

- RMP requirements with respect to total catches/human-induced mortalities over time – especially with regard to non-IOS monitored mortalities such as bycatches, IUU fishing etc; and
- the questions of ensuring that regulations both are obeyed and are seen to be obeyed.

A working group on catch verification was therefore established to explore the matter further. The working group met in Antigua in April 2003 (IWC/55/COMMS 3) and reached broad agreement on the following issues:

- the Inspection and Observation Scheme (IOS) would satisfy the requirements that the regulations are obeyed and are seen to be obeyed for registered IWC operations;
- there are advantages in an RMP context, to some additional catch verification (e.g. with respect to IWC illegal vessels, non-IWC vessels with and without export to IWC countries, and other removals such as illegal (i.e. unreported) bycatch);
- DNA/market sampling (DNA/MSS) systems and catch documentation schemes (CDS) share many of the same attributes but differ in terms of cost, ease of fraud and instant checking – however, while there are no features of a CDS that cannot be fulfilled by a DNA/MSS, the reverse is not true;
- if DNA registers are used there is no need to have a single IWC registry (i.e. national registries could be continued) provided common standards (techniques and laboratories) are met;
- if a DNA/MSS is used, some form of audit at all stages is necessary from the perspective of transparency;
- any market sampling would require careful design; and
- if DNA registers are used, samples for testing must be submitted via governments or appropriate intergovernmental organisations to avoid fraudulent claims.

The working group did not agree on:

[2] At IWC/52 the Commission endorsed text on total catches over time – see section 3.7.

- whether both DNA registers and a Catch Documentation Scheme (CDS) might be needed. Some thought application of both systems would be duplicative, others that they would be complementary. However, in the absence of a specific proposal, there has been some confusion over what is intended in relation to the form and scope of any CDS, e.g. should it be to the point of import or through to the consumer (product labelling); and
- the need for, and level of, international/independent oversight of a DNA/MSS if used – and who might provide such oversight.

Towards resolution

No further progress was made during IWC/55, but considerable time was spent discussing catch verification by the CSG. From these discussions it is clear that the objectives of a catch verification scheme are to ensure that:

(1) IWC commercial catch limits (and other regulations) are not exceeded by member countries; and

(2) total anthropogenic removals (direct catches and bycatch) are not exceeded (both in terms of IWC and non-IWC countries) – this involves obtaining information on their levels.

The aim is NOT to monitor trade *per se.*

For vessels registered by Contracting Governments, the EDG's IOS proposal will provide internationally verified information on all aspects of the catch (including quota monitoring) required by the IWC (position, sex, date etc.). However, for vessels from IWC member countries operating illegally or vessels from non-member countries (i.e. IUU whaling) there clearly will be no inspectors/observers and consequently other measures will be needed to detect/deter such operations. Similarly, measures would be needed to detect/deter unreported bycatches.

Given the above, the CSG broadly recognised the value of some combination of the following additional catch verification measures:

- diagnostic DNA registers and market sampling – against the background that national registers meeting the requirements of the Scientific Committee are already in place in Japan and Norway;
- some form of catch documentation – recognising that at present, whale products require CITES export/import permits and that these should be taken into account in the development of any further documentation;
- national regulations only allowing importation of whale products from other IWC countries with DNA registers – recognising that while regulations about trade in whale products are outside the IWC's remit, there is some precedent since the Commission did adopt a Resolution at its 31st Annual Meeting in 1979 that resolved, among other things that 'all member nations shall cease immediately any importation of whale meat products from, and the export of whaling vessels and equipment to non-member countries and operations'. Japan already has national legislation prohibiting the import of whale meat from non-IWC member countries as well as from IWC countries that are non-whaling. It also prohibits importation of whale meat from whales taken in violation of IWC regulations.

PROCEDURE FOR CHECKING SAMPLES

An agreed specified system for submitting samples to the register(s) for 'checking' must also be developed to prevent fraudulent claims of illegal products being found. Under this system it is proposed that:

(1) samples must be submitted via national governments or appropriate intergovernmental organisations with proof of origin of the samples; and

(2) analysis must follow agreed techniques in approved laboratories.

3.3 Costs

The issue

There is general agreement that there should be an element of cost-sharing, i.e. that some of the costs of an RMS should be paid by the Commission who would then recover these costs through a 'factor' in the financial contributions assessed from Contracting Governments. The October 2002 private Commissioners' meeting established a small working group to explore and recommend to the Commission how this 'factor' might be defined, and in particular how a fair balance between the interests of whaling and non-whaling countries could be determined. The working group met in Antigua in May 2003 (IWC/55/COMMS 4). It agreed that there were four main elements to the costs of an RMS:

(1) national inspectors;
(2) international observers;
(3) vessel monitoring systems; and
(4) catch verification.

Cost estimates were developed for each element, although in relation to catch verification, estimates could only be developed for DNA registers/market sampling since no definite proposal for a Catch Document Scheme had been made.

The working group did not reach agreement on how costs might be apportioned among Contracting Governments, although there was general agreement that the costs of national inspectors should be paid by the flag state (with the exception where, as foreseen in the EDG proposal for the IOS, an individual acts as both national inspector and international observer when it may be appropriate for some cost sharing).

The working group also did not reach agreement on RMS costs and the overall financial contributions scheme. Two options were considered:

(a) factor them into the financial contributions scheme; or
(b) have them as a separate budget item.

The group did agree, however, that addressing the issue of RMS costs should not undermine the principles guiding the work of the Contributions Task Force (CTF) and its efforts to date, particularly with respect to reduced costs for developing countries.

The working group believed it had achieved as much as it could given the uncertainties involved.

In Berlin, Commissioners noted the usefulness of having broad cost estimates for the observer scheme and DNA registers/market sampling, even if both entailed considerable assumptions. All members recognised that the costs were significant in terms of the IWC budget, although some believed they were not large in the 'market' context. As with catch verification, there was no agreement in the Commissioners' meeting as to whether sufficient progress on this issue had been made, although the meeting noted that it is difficult to discuss the question of overall costs in isolation from the question of who shall pay.

Towards resolution

The issue of costs and how they might be apportioned was touched on during the discussions of the CSG, but was not discussed extensively. The group felt that the major cost elements of the RMS would be associated with:

- national inspectors;
- international observers;
- DNA registers and market sampling; and
- some sort of (trade) document scheme.

VMS was not included in this list since the small group is proposing that VMS is only required on small boats making only day-trips and with room for neither an inspector or observer aboard (see Section 5 and Appendix 1).

While further discussions are necessary about how costs are apportioned, the CSG considered that further consideration could be based on the general principle that costs for national activities be borne by relevant national governments, while international costs for securing transparency could be allocated in the context of the overall financial contributions scheme - as indicated in the following table.

Cost element	Who pays
National inspectors	Appropriate member countries
International observers	The Commission, in accordance with a Financial Contributions Scheme
VMS	Appropriate member countries
DNA registers + market sampling:	
set-up and running of systems	Member countries with DNA registers
oversight/review of national systems	The Commission, in accordance with a Financial Contributions Scheme
Checking	The country requesting the checking

3.4 Restricting whaling to national waters/area limitations

The issue

The proposal to restrict whaling to within EEZs, at least for a limited period prior to allowing 'full' whaling, was made principally as a measure to boost public confidence in IWC's ability to manage whaling successfully following the overexploitation of the past. While this proposal has been supported by some, possible difficulties have been raised by others. For example, some consider that a blanket closure of the high seas to exploitation may be contrary to UNCLOS. Concerns have also been expressed that in the present atmosphere of mistrust, any time-limit provision may be reminiscent of the 1990 'deadline' in paragraph 10(e) (i.e. that the restrictions would not be lifted at the appointed time). Others have noted that restricting catches to national waters in some circumstances would reduce yield and would be even more cautious than the already extremely cautious RMP. Finally some have observed that such a provision may also increase supervision and control difficulties since small-scale coastal activities can be more difficult to monitor than large-scale offshore operations.

Towards resolution

During the October 2002 Commissioners' RMS meeting, there had been the suggestion that the concept of area restrictions could be included as a recommendation embodied within a Resolution rather than a Schedule requirement and it was agreed to consider this approach further at a later date. During discussions of the CSG, the view was expressed that some sort of phased-in approach to commercial whaling could be useful and that this might be achieved through initial area limitations in the context of RMP *Implementation*s, such that in the first five years after the lifting of paragraph 10(e), catches are restricted to within national waters.

3.5 Trade restrictions

The issue

The proposal is to restrict trade in the meat and products of whales taken to local consumption only (i.e. no international trade to be allowed). Its reasons were two-fold:

(1) that past trade pressures were partly responsible for overexploitation of whale resources; and
(2) as part of the 'confidence-building' exercise.

Although initially proposed as a permanent measure, Ireland had indicated more recently that it could be time-limited.

Although there has been some support for this proposal, strong opposition has also been voiced. Those opposing the proposal believe that such a ban is:

(a) discriminatory against countries with small populations;
(b) against principles of free trade; and
(c) outside the competence of IWC.

They believed that public confidence should be built via other mechanisms.

Towards resolution

The potential problems with a blanket ban on all international trade were recognised by the CSG. However, it was noted that under some circumstances, certain trade measures might be appropriate, for example to combat IUU fishing, as is done by some fisheries management bodies (such as CCAMLR and ICCAT).

3.6 Animal welfare data

The issue

Currently, information on animal welfare (weapons used, time-to-death, etc.) is provided to the Commission on a voluntary basis. Some years ago however, the UK, with support from other member governments, proposed that the collection of animal welfare data should be a requirement of the RMS and included in the Schedule. It proposed a list of data to be collected. Other governments have raised three difficulties with this issue:

(1) the competency of IWC to address animal welfare;
(2) whether or not such information is necessary; and
(3) lack of trust.

With respect to the last point, some countries have noted that even the discussion of the data currently provided voluntarily are used in a wholly negative manner by some, rather than being used for constructive discussion on how to improve killing methods. Given this experience, they believed that the *status quo* of voluntary reporting should be continued.

Towards resolution
During discussions within the CSG, it was recognised that despite the opposing views, animal welfare is clearly an issue that needs to be addressed. The group noted that the principle that whaling should not inflict unnecessary suffering had already been agreed in discussions concerning the potential revised Schedule (see paragraph 13 of IWC/54/RMS 2). Two additional suggestions were made. One was that collection of data should not be considered mandatory as part of the 'package', but facilitated by including in the duties of international observers an item along the lines that they should 'collect such data that the Commission from time to time might request'. These data would not necessarily be the full list proposed by the UK. The other suggestion that received broad support, was that rather than requiring collection of comprehensive animal welfare data on all whaling vessels as a Schedule requirement under 'Information Required', there could be dedicated well-designed scientific programmes to improve whale killing methods, with the results being discussed at scientific workshops.

3.7 Special permits

The issue
In addition to area and trade restrictions, some have called for the phasing out of whaling under special permit. This aspect was touched upon briefly at the October 2002 private Commissioners' meeting. At that meeting, different views were expressed as to the need for any link/relationship between scientific permit catches and the RMS. While some Contracting Governments continue to support scientific whaling and its value for management and other important issues, others believe it to (1) be no longer necessary and (2) to be taking place on a larger scale than foreseen when the Convention was negotiated. Nevertheless, the right under Article VIII of the Convention for Contracting Governments to take whales for research purposes under scientific permit is not disputed and the suggestion was made at the October 2002 meeting that some sort of voluntary code of practice could be developed governing the conduct of scientific whaling. It was envisaged that this would not form part of the RMS but would be a document to which the IWC and others could refer.

Towards resolution
The concept of a voluntary Code of Conduct as a way to address the concern some governments have with special permit whaling was taken further during the discussions within the CSG. It was suggested that such a code might include certain features that research programmes should have and that it would need to be developed by scientists. This code might also increase the level of participation of scientists from other countries in the design and conduct of the research programmes. This could include, for example, holding an international workshop before designing a given research programme to improve the scientific review process and to avoid the research proposals, currently presented for review to the Scientific Committee a relatively short time before being implemented, being seen as a '*fait accompli*'.

The CSG identified two scenarios exist for special permit catches: (1) special permit catches upon species/stocks for which an RMP *Implementation* has been completed; and (2) those for which no *Implementation* has been completed. In the former case, the RMP explicitly takes into account catches under special permit by taking them off the 'commercial' catches as follows:

> 'Catch limits calculated under the Revised Management Procedure shall be adjusted downwards to account for human-induced mortalities caused by aboriginal subsistence whaling, scientific whaling, whaling outside IWC, bycatches and ship strikes.
>
> Each such adjustment shall be based on an estimate provided by the Scientific Committee of the size of the adjustment required to ensure that total removals over time from each population and area do not exceed the limits set by the Revised Management Procedure. Total removals include commercial catches and other human-induced mortalities caused by aboriginal subsistence whaling, scientific whaling, whaling outside IWC, bycatches and ship strikes, to the extent that these are known or can reasonably be estimated.' (*Ann. Rep. Int. Whaling Comm.* 2000: 32).

While a 'code of conduct' would be applicable for the first scenario, it would be particularly appropriate for the second.

3.8 Sanctuaries

The issue
The Irish Proposal called for sanctuaries to be respected, and concern is often expressed by some regarding the whaling that is occurring within existing sanctuaries. Others consider that sanctuaries within the IWC context are playing a different role than in other fora, i.e. they are seen as a way to achieve a global ban on commercial whaling rather than as a management tool. During discussions within the CSG, there was a suggestion that the existing IWC sanctuaries could be reviewed in the context of certain Marine Protected Areas (e.g. that had core areas, areas of limited use, etc), but in the end the general view was that sanctuaries would be a difficult issue to build into any 'package' and that it would be best to stick to the *status quo*.

4. DEVELOPING AN RMS 'PACKAGE'

Given the discussions held to date on the RMS, including the constructive and positive discussions held within the CSG, I believe the time is right for the Commission to make real and directed progress towards an RMS. The Preface to this document outlines what I believe is an incontrovertible case for the timely adoption of an RMS from the twin standpoints of conservation and wise management. I recognise that this will require an atmosphere of trust and mutual understanding that has appeared to be lacking in recent IWC meetings. I have been encouraged and heartened by the constructive nature of discussions within the CSG despite the very different opinions held on a number of key issues. Given that, I have developed what I believe to be a fair and realistic proposal for the essential ingredients of an RMS package for consideration now by the whole Commission. The proposal is, of course, open to discussion. As its cornerstone is the RMP that I believe still represents the most advanced and well-tested scientific approach to the management of natural resources; it is considerably more conservative than measures that we all accept in other national and international management regimes. Inevitably, not every detail of this package will satisfy every member nation – that is inherent in the concept of compromise. However, in my proposal I have endeavoured to respect to the extent possible the various viewpoints held by Commission members within a logical framework that ensures that the rules and regulations of the Commission are not only obeyed but also seen to be obeyed in an efficient and cost-effective manner.

4.1 Elements to include in the RMS 'package'

Following from the above, I would like to commend to the Commission the following as elements to include in an RMS 'package'. Some elements are appropriate to be incorporated as part of the Schedule, while others could be best addressed using voluntary measures such as Resolutions and codes of conduct. However, the proposal is for a package as a whole; it is the combination of all of these elements that I believe best meets the objectives for the RMS agreed by the EDG. It is my hope that such a package will be able to receive broad support from Commission members.

Elements to be incorporated as part of the Schedule

- The RMP (including survey guidelines and provisions for total catches over time).
- A phased-in approach to commercial whaling.
- A national inspection and International Observer Scheme.
- Additional catch verification measures.
- Compliance.
- A mechanism to apportion RMS costs among member countries.
- Measures for the lifting of Schedule paragraph 10(e).

Elements to be dealt with primarily via Resolutions and similar measures

- Whaling under special permit.
- Animal welfare considerations.

This 'package' of measures includes, in some way, almost all of the elements that have been discussed recently in the context of the RMS. The exceptions are blanket trade restrictions and sanctuaries. As indicated earlier, while noting that some trade restrictions might be appropriate in the context of deterring IUU whaling, I recognise the strength of the view that a blanket ban on international trade in whale products would:

(1) be discriminatory against countries with small populations;
(2) be against principles of free trade; and
(3) be outside the competence of IWC.

In addition, such a ban would not appear to further the conservation and wise management of whale stocks in addition to the RMS package proposed. With respect to sanctuaries, these are provided for under the Convention and should be reviewed on their conservation and management merits. They would therefore be difficult to build into any RMS 'package'.

An outline of the different elements and an indication of where significant further work is required is provided in the next section.

4.2 Description of RMS 'package' elements

4.2.1 The RMP

The RMP as agreed by the Scientific Committee and endorsed by the Commission should be used to set commercial whaling catch limits. In effect all catches will be zero until the Scientific Committee has completed an *Implementation* for a particular species and area. The Committee cannot begin an *Implementation* without instructions from the Commission. In the present atmosphere of mistrust, safeguards are needed to ensure that non-scientific methods are not used to delay/prevent *Implementation* work (in either the Commission or the Committee) as well as to ensure that it is carried out with appropriate scientific rigour.

FURTHER WORK

The Scientific Committee is already working on guidelines relating to the level of information needed to begin and complete an *Implementation* as well as the time such a process should take. I have asked the Secretariat to explore (with appropriate members of the Scientific Committee) how such provisions could be built into the RMP (and thus into the Schedule).

4.2.2 A phased-in approach to the resumption of commercial whaling

I believe that some sort of phased-in approach to commercial whaling could be useful in building public confidence in the IWC's ability to manage whaling and conserve whale stocks. This is not to imply either that the RMP is not safe or that there will be immediate widespread whaling on all species around the world. I suggest that the best approach would be by phasing-in the areas in which commercial whaling would be allowed and propose that when whaling resumed, it would initially (e.g. for a 5-year period) be within waters under national jurisdiction of member countries. Safeguards would be needed to make sure that this would only be a temporary measure, such as a clear sunset clause in the Schedule text. One option for such text might be:

> 'Notwithstanding the catch limits by Small Area shown in Table 2, whaling will be restricted to waters under the national jurisdiction of the relevant Contracting Governments until 1 January 200X. After that date, this restriction will no longer be in effect.'

4.2.3 A national inspection and International Observer Scheme

This would be as proposed by the EDG (where, in general, observers and inspectors are placed on all boats where practical), and include the proposals made by the CSG on VMS and observers on catcher vessels (see Annex), i.e. VMS on very small vessels with < 24hr trips and one observer per catch vessel attached to a factory ship.

4.2.4 Additional catch verification measures (involves Schedule amendments and a Resolution)

I propose that additional catch verification measures involving national diagnostic DNA registers/market sampling systems and import controls should be included in the RMS to ensure that IWC removal limits are not exceeded by IUU whaling and/or unreported bycatches.

DNA REGISTERS/MARKET SAMPLING

DNA registers/market sampling systems should form the major part of the catch verification system. They should have the following attributes:

- national diagnostic DNA register for each whaling country or group of countries (to agreed specifications) to avoid redundancy and additional costs; and
- designed market sampling system (to agreed specifications).

TRANSPARENCY

While DNA registers and market sampling (DNA/MSS) will meet the objective of regulations being obeyed, a level of transparency attached to these systems is required to meet the objective that regulations are seen to be obeyed. There are varying interpretations of the competency of the Commission with regard to international trade and the monitoring of domestic markets and, even though the objective of the catch verification scheme is not concerned with the monitoring of trade *per se*, any arrangement for securing the transparency of the catch verification system must take this into account to be broadly acceptable.

Transparency could be obtained in a number of ways. For example, the IWC Scientific Committee has already reviewed the specifications for the existing national registers and approved them. Formal specifications could thus be drawn up by the Committee in conjunction with those involved in the existing registers. National governments could agree voluntarily to provide relevant updated information on the registers. Similarly, national governments could allow outside review of the design of domestic market sampling programmes and protocols for voluntary submission of data. Further discussion on this matter is required (e.g. the nature of the outside review and the composition of any expert groups).

FURTHER WORK

Specifications for the DNA/MSS need to be developed and agreed, as does a system to provide transparency/oversight. For the former it is likely that an expert group will need to be established to develop proposals for review by the Scientific Committee and the Commission. For the latter, the Secretariat has been asked to draft a discussion paper outlining a series of options.

A system for submitting samples to the register(s) for 'checking' must be developed to prevent fraudulent claims of illegal products being found. In developing such a system, consideration must be given to whether such samples are checked against the national registers themselves, or whether Contracting Governments should provide the genetic profiles of each individual whale in their registers in confidence to an outside body in a pre-specified electronic format (a small technical group would be required to develop detailed specifications). The latter would allow the comparisons to be compared independently from the national database. Such a system could provide a simple yes/no answer to whether a sample is from an animal in a diagnostic register.

NO IMPORTATION OF WHALE PRODUCTS FROM NON-IWC COUNTRIES OR FROM ILLEGAL OPERATIONS

Preventing the import of whale products from non-IWC countries or from illegal operations of boats registered in IWC countries is an essential element of the catch verification approach. I suggest that this is done in two ways:

- a Resolution agreeing that Contracting Governments will institute national legislation prohibiting the import of whale products from non-IWC countries as well as from IWC countries that are non-whaling (such legislation already exists in some countries such as Japan); and
- a system of catch documentation to the point of entry/landing.

With respect to the latter it is clear that some form of documentation will be required by national governments at the point of entry to show that the products come from whales caught legally by an IWC country. Whale products not accompanied by such a document would not be allowed to be imported. While it is the responsibility of national governments to decide what documentation they would require when products are being imported, it would be valuable to develop an IWC *pro forma* that takes into account (1) the FAO harmonised trade document and CITES documentation (which is currently required), and (2) sensitivities regarding IWC's competency to address trade issues.

I do not believe that documentation/product labelling once a product has entered an IWC country is necessary given other measures in place.

FURTHER WORK

A new Resolution concerning national legislation prohibiting the import of whale meat from non-IWC countries as well as from IWC countries that are non-whaling needs to be drafted. The Secretariat has been asked to review existing relevant Resolutions and to draft a consolidated version.

With respect to catch documentation, the Secretariat has been asked to examine CITES documents and the FAO proposal for a harmonised trade document with the view to developing an IWC *pro forma* if considered necessary.

4.2.5 Compliance

A Compliance Review Committee would be established with the duties as developed by the EDG and agreed by the Commission (IWC/54/7 and IWC/55/COMMS 2). Under the Convention, it is clear that it is the responsibility of relevant Contracting Governments and not the IWC to impose penalties and I propose that the recommendations of the Compliance Working Group from IWC/55 be followed, i.e. that the following text be included in the Schedule: 'The Compliance Review Committee reports on infringements and the seriousness of these infringements to the Commission and advises the Commission what actions, if any, to be taken'.

4.2.6 Apportioning RMS costs among Contracting Governments

Clearly more discussion is needed on how RMS costs should be apportioned, but I recommend that it is based on the general principle that costs for national activities be borne by relevant national governments, while international costs for securing transparency could be allocated in the context of the overall financial contributions scheme - as indicated below.

Cost element	Who pays
National inspectors	Appropriate member countries
International observers	The Commission, in accordance with a Financial Contributions Scheme
VMS	Appropriate member countries
DNA registers and market sampling:	
set-up and running of systems	Member countries with DNA registers
oversight/review of national systems	The Commission, in accordance with a Financial Contributions Scheme
Checking	The country requesting the checking

FURTHER WORK

This is an issue that needs further discussion, as does the relationship with the work of the Contributions Task Force. The Commission has always recognised the interaction between the work of the Task Force and RMS cost discussions, but until now, the Task Force has been asked to develop a contributions formula that does not take future RMS costs into account. However, if the Commission reacts favourably to my proposals for an RMS 'package', there will be significant implications for any revised contributions formula. Consequently, while the development of a revised contributions formula remains high priority for the Commission, I believe that it would be prudent to delay further work of the Task Force until the Commission has discussed the RMS in Sorrento and assessed any implications for the work of the Task Force. The Task Force had been scheduled to meet before IWC/56 to try to finalise a proposal for a revised contributions formula. However, given the above and after consulting with the Task Force members and the Advisory Committee it has been decided to postpone the Task Force meeting.

4.2.7 Measures for the lifting of Schedule paragraph 10(e)

I do not believe that trying to finalise an RMS in isolation of discussions on paragraph 10(e) is appropriate, and consider that a way of linking agreement on an RMS with the lifting of paragraph 10(e) needs to be found. My preferred approach is to modify paragraph 10(e) such that it becomes invalid on a specific day whilst ensuring that any whaling operations are undertaken under the full RMS package as adopted by the Commission.

FURTHER WORK

Developing appropriate text to achieve this is not a simple task, and the Secretariat has been asked to develop some possible Schedule text and scenarios for consideration.

4.2.8 Whaling under special permit

Recognising:

(1) the right of governments under the Convention to issue special permits;
(2) concern expressed by some regarding scientific whaling; and
(3) the need to obtain as broad a consensus as possible on the RMS 'package'.

I believe that an appropriate approach would be to develop a voluntary 'code of conduct' for whaling under special permit as part of the RMS 'package'. Such a code might include certain features that research programmes should have, e.g. with respect to appropriate abundance estimates, improved participation of scientists from other countries in the design, review and conduct of research programmes, e.g. through international intersessional workshops.

FURTHER WORK

A draft code of conduct needs to be developed. I suggest that the group within the Scientific Committee that is already working to consolidate existing guidelines is requested to develop recommendations for such a code.

4.2.9 Animal welfare considerations

The differing opinions among Contracting Governments over the competency of IWC to address animal welfare issues should be recognised and taken into account.

I suggest that animal welfare considerations be addressed primarily through an initiative (perhaps by Resolution) to focus discussions within the Commission on improving the techniques to kill whales, based on (1) voluntary reporting of data as discussed at the Workshop in Berlin; and (2) the voluntary provision of information from existing research programmes (and/or the development of a co-operative research programme) at regular (e.g. triennial) specialist workshops).

In addition, the importance of taking animal welfare considerations into account should be explicitly recognised in the Schedule through the inclusion of text along the following lines:

> 'The hunting of whales shall be undertaken so that the hunted whale does not experience unnecessary suffering and so that people and property are not exposed to danger.'

5. POSSIBLE NEXT STEPS

A private Commissioners' meeting on the RMS is scheduled for the afternoon of Friday 16 July 2004 in Sorrento. This meeting will provide an opportunity for me to present and explain the rationale behind my proposals, for Commissioners to provide feedback and for the Commission to discuss next steps. I believe that the objective of these steps should be to work towards developing a draft final proposal for adoption at the meeting in 2005.

If the Commission wishes to take the work forward along the lines I propose, this will require substantial intersessional activity of both a technical and policy nature prior to the 2005 Annual Meeting. A number of intersessional meetings will be needed and could include a meeting of the CSG, meetings (2-3) of expert groups tasked with developing necessary details on certain aspects (as indicated above) and a private Commissioners' meeting. I believe that the intersessional work would best be progressed through private meetings. However, recognising the need for transparency to the wider IWC community and beyond, provision for an open meeting on the RMS (e.g. the RMS Working Group) should be included in the meeting schedule for IWC/57.

Appendix 1

Recommendations from the Chair's small RMS group concerning the International Observer Scheme

The small RMS group was able to address the two issues outstanding regarding the International Observer Scheme, i.e.:

1. Whether VMS is required on all vessels or, as proposed by the EDG, only on category (a) vessels, i.e. vessels that operate day trips (< 24 hours) only, carry out no substantial flensing on board and can accommodate neither a national inspector nor an international observer. For these vessels, the EDG agreed that a combination of VMS data transmitted in real-time to an observer at the point of landing is acceptable.
2. Whether, for pelagic operations, there should be observers on board each catcher vessel in addition to observers on board each factory ship.

The Chair's small RMS group recommends that:

- VMS is only required on category (a) vessels.
- One international observer would be deployed on each catcher boat attached to a factory ship. It was noted that as experience is gained, it may eventually be decided that observers are only needed on the factory ship.

Annex F

Statement from Henrik Fischer, Chair of the Commission, to the Private Meeting of Commissioners/Alternate Commissioners on the 16th July 2004

First of all I would like to express my deep regret and disappointment at not being able to attend and Chair the 56th Annual Meeting and in particular in being unable to present my proposal on the RMS to you in person and to work with you all to seek agreement on a way forward. I hope however, that you will permit me to communicate, via this statement, the great importance I give to completion of the RMS and what I would like the discussions on the RMS in Sorrento to achieve.

Given the lengthy discussions held to date on the RMS, and especially the constructive and positive discussions held within my small RMS group since last year's meeting in Berlin, I believe the time is right for the Commission to make real and directed progress towards an RMS. I fear that failure to put an RMS in place may not only jeopardise the future of the IWC, but perhaps more importantly serve neither the interests of whale conservation nor management – the dual mandates of our Convention.

The Preface to my proposal (IWC/56/COMMS 2) outlines what I believe is an incontrovertible case for the timely adoption of an RMS from the twin standpoints of conservation and wise management. I won't repeat the case here, but ask you to consider it very carefully indeed. I recognise that the completion and timely adoption of the RMS will require an atmosphere of trust and mutual understanding among member governments that has often appeared to be lacking in recent IWC meetings. However, I was encouraged and heartened by the constructive nature of discussions within my small group, despite the very different opinions held on a number of key issues, and hope that this spirit of co-operation and willingness to seek compromises will continue into the private Commissioners' meeting and indeed all aspects of the Commission's work this year.

I have developed what I believe to be a fair and realistic proposal for the essential ingredients of an RMS package for consideration now by the whole Commission. Inevitably, not every detail of this package will satisfy every member nation – that is inherent in the concept of compromise. However, I have endeavoured to respect, to the extent possible, the various viewpoints held by Commission members within a logical framework that ensures that the rules and regulations of the Commission are not only obeyed but also seen to be obeyed in an efficient and cost-effective manner.

The proposal is, of course, open to discussion. However, as the package includes, in some way, almost all of the elements that have been discussed recently in the context of the RMS, the exception being blanket trade restrictions and sanctuaries (for reasons explained in my document), I strongly urge you to concentrate on refinements to the package and not, unless deemed necessary by the great majority of Contracting Governments, entertain suggestions that would involve major changes and reconstruction of the entire package. If refinements and changes are considered necessary – and there no doubt will be some – then I believe it is essential to have a clear explanation of why they are needed, following the approach that I have used for my proposal.

If there is a generally favourable reaction to my proposals for an RMS, then I believe it should be possible to have firm proposals ready for adoption at the meeting in 2005. This will require substantial intersessional activity of both a technical and policy nature prior to the 2005 Annual Meeting.

In conclusion, I sincerely hope that you will be able to broadly accept my proposal for an RMS package and agree to the necessary intersessional activities. Once again, I stress my view that failure to put a workable RMS in place will serve neither the interests of whale conservation nor management – the dual mandates of our Convention.

Annex G

Information Provided by Contracting Governments regarding Whale Killing Methods and Associated Welfare Issues

DENMARK (GREENLAND)

1. Summary of Activities Related to the Action Plan on Whale Killing Methods (based on Resolution 1999-1)

Contracting Government	Denmark (Greenland)
Season	2003
Area	Greenland
Fishery type (e.g. commercial, aboriginal subsistence, scientific permit)	Aboriginal subsistence

Summary of primary and secondary whale killing methods used
(Note that the appropriate Method No. should be used throughout the form)

Method No.	Brief description of method (e.g. penthrite grenade, 'cold' grenade, rifle *of stated calibre*, etc). Put the most commonly used method first. Insert more rows if necessary.	Used as: (state whether primary killing method, secondary, or both)
1	Penthrite grenade	Primary (142 in West Greenland)
2	Rifle (minimum 30.06 cal. (7.62 mm) and cal. .375 or cal. 458	Primary (52 in West Greenland + 13 in East Greenland)

Summary of criteria used to indicate unconsciousness and death

[Include brief description here]
Criteria: when the whale does not move and the flippers are immovable.
Number of whales killed instantly are whales reported killed within 1 minute.

Summary of information providers

Percentage of data provided by:	
• Inspectors	0%
• Scientists	0%
• Hunters	100%
• Other (please specify)	0%

Summary of hunt

Item	Species 1 *Minke whale - West Greenland*		Species 2 *Minke whale - East Greenland*		Species 3 *Fin whale*	
	No.	%	No.	%	No.	%
Whale killing methods						
• Total no. killed (all methods summed)	185		13		9	
• Total killed using Method 1 only	133	72			9	100
• Total killed using Method 2 only	52	28	13	100		
• Total killed using Method 3 only						
• Total needing secondary harpoon or other secondary killing method						
• If bullets used:						
- minimum number						
- maximum number						
- median number						
Time to unconsciousness/death (TTD)*						
• Total for which information recorded	179		13	100	7	78
• Total estimated TTD to be instant	36		2	15	1	20
• Maximum estimated TTD	300 min.		60 min.		720 min.[1]	
• Mean time to TTD	14 min.		31 min.		114 min.[1]	
• Median Time to TTD	8 min.		25 min.		10 min.	
Other information						
• Total targeted and missed						
• Total struck and lost	7		1		3	

[1]The time to death of 720 minutes of one struck and lost fin whale was caused by bad weather conditions and the breaking of the harpoon string. When excluding this one whale the average time to death was 13 minutes.

***NB: The Resolution asks for TTD information for each whale not killed instantly. Please append these data, e.g. as Table or histogram.** [none]

Any other relevant information e.g. with information on technical assistance given to other fisheries or with respect to new studies to (a) improve methods and TTD, (b) develop new criteria for TTD. [none]

2. Report on improvements in ASW in Greenland

Referring to Resolution 1997-1 on improving the humaneness of aboriginal subsistence whaling, the Greenland Home Rule Government would like to report the following on the process of improvements:

- The harpoon-cannon renovating programme finished in 1998. 71 harpoon cannons were well functioning and safe. 37 vessels with a mounted harpoon cannon were active in the 2003-season, and approx. 575 skiffs were used in the collective hunt.
- A seminar on renewable resources was held 9-11 October 1998 in KATUAQ, the Greenlandic cultural centre in Nuuk. Representatives from all relevant Greenlandic parties were gathered to discuss future ways for sustainable harvest, the situation of the living natural resources, hunting ethics, sharing the resources, etc.
- On 9-11 February 1999 the North Atlantic Marine Mammal Commission (NAMMCO) held a workshop on hunting methods used for hunting marine mammals in NAMMCO member countries. As the workshop was held in Nuuk, Greenland, several Greenlandic hunters participated in this workshop and had the opportunity to share information on hunting methods with other hunters and whalers.
- From March to September 2000 several courses on the handling and instruction of the use of the new Norwegian penthrite grenade (Whale Grenade-99) were held for about 150 whalers, wildlife officers and the Greenland Trade Company (distributor of the grenade in Greenland). The whalers representing the 71 vessels with a mounted harpoon cannon. The courses were arranged in cooperation with Dr. Egil Ole Øen and the Greenland Home Rule ship consultant Mr Peter Siegstad and the Department of Industry.
- The harpoon-cannons are inspected every second year, thereby reducing the risks for the hunters to a minimum and maximising the efficiency when killing whales.
- In November 2001, NAMMCO held a weapons and ammunition workshop in Sandefjord, Norway, on ballistics related to hunting in the NAMMCO member countries of relevant mammals and marine mammals, including minke whales and fin whales.
- In January 2003, NAMMCO held a conference titled 'Users Knowledge and Scientific Knowledge in Management Decision Making' on how both user knowledge and scientific knowledge can be incorporated into management decisions. The recommendations and conclusions from the Conference will form the basis to further the work of integrating user knowledge into the management decision making process.
- From April to August 2003, 9 courses on the handling and instruction of the use of the Norwegian penthrite grenade (Whale Grenade-99) were held for about 75 whalers. The courses were arranged in cooperation with consultant Mr Peter Siegstad and the Department of Fisheries and Hunting.

3. A note regarding information encouraged in Resolution 1999-1

The following text contains comments to Resolution 1999-1 regarding the operative paragraphs 2-5:

Ad 2: Number of whales killed by each method:

- In West Greenland, the total minke whale quota was 190, including a carry-over quota. 135 (reallocation 133) minke whales were allocated to vessels with harpoon cannons and 55 (reallocation 57) to the collective hunt. In East Greenland, the quota of 15 minke whales was allocated to the collective hunt, including a carry-over quota.
- In West Greenland, the municipal collective hunt quota on minke whales varied from 2 to 6 animals. The municipal quota to vessels with harpoon cannons was a free quota. 37 of 65 vessels were active in 2003. The 2003 quota and catch of minke whales and the number of vessels with harpoon cannons can be seen in Appendix 1.
- In West Greenland, 133 minke whales were killed by harpoon whereas 52 minke whales were killed in the collective hunt. In East Greenland 13 minke whales were killed in the collective hunt.
- The fin whale quota of 19 animals was set free for vessels mounted with harpoon cannons. In the 2003 season, 9 fin whales were killed.

Number and proportion of total whales killed instantaneously; time-to-death for each animal not killed instantly:

- 36 minke whales were reported killed within 1 minute, the average time to death for minke whales was 14 minutes. 1 fin whale was reported killed within 1 minute. The average time to death for fin whales was 114 minutes, this caused by one struck and lost whale with a time to death of 720 minutes due to bad weather conditions and the breaking of the harpoon string. When excluding this one whale the average time to death was 13 minutes.

Number of whales targeted and missed; number of whales struck and lost:

- See Appendix 1.

Calibre of rifle used and number of bullets used:

- In the collective hunt on minke whales, a minimum of 30.06 cal. (7.62 mm) rifle and cal. .375 or cal. .458 are used. It is not an obligation to report the number of bullets used. It will require many resources to collect information from approx. 575 skiffs.

Methods used to determine unconsciousness/time to death:

- The information collected from the hunters is not scientifically based. There is an instruction on how to determine the time to death in the regulation; from the first shot to the time when the hunter measures that the whale is dead.

Ad 3: Development of more accurate indicators for determining the time to death other than cessation of movement:

- Greenland is lacking the assistance from veterinarians who, in a professional manner, are capable of collecting data on the time to death, and of developing more accurate indicators for determining the time to death.

Ad 4: 'Recognises the difficulty, in some aboriginal subsistence hunts, of obtaining time to death information….'

- See the comments in point 3.

Ad 5: 'Encourages all Contracting Governments to provide appropriate technical assistance to reduce cruelty in aboriginal subsistence whaling.'

- Greenland has a very good working relationship with the Norwegian government allowing Greenland to import the new whale grenade. Furthermore, Greenland gets very good assistance from Dr. Egil Ole Øen concerning the introduction and instruction of how to use the newly developed penthrite grenade used in the minke whale and fin whale hunt.
- Greenland also seeks advice on how to improve hunting gear and methods through the very fruitful working relationship via NAMMCO which arranged a workshop on hunting methods in February 1999, and a workshop on marine mammals: weapons, ammunition and ballistics, in November 2001.

4. Status for Greenland Action Plan on Whale Hunting Methods, 2003

Implementation of the Greenland Action Plan on Whale Hunting Methods was described in IWC/46/AS3. Recent development in Greenlandic Whaling was furthermore presented in IWC/49/AS3, IWC/51/WK6, IWC/51/WK7, IWC/51/WK8.

With reference to the 10 point Revised Action Plan recommended from the workshop on Whale Killing Methods, 1995, the status for the Greenland Action Plan on Whale Hunting Methods in 2003 is summarised as follows.

Re. Rev. Action Plan point 2: Continue improving accuracy of delivery of penthrite grenade harpoons, including assessment of refined sighting equipment suitable for rapid action under conditions encountered at sea. Support and encourage the development and implementation of programmes to provide training in the safe handling and effective use of killing devices including the penthrite grenade and in other aspects of the hunt.

In close co-operation with the Greenlandic Trade Company (Pilersuisoq A/S) detonating penthrite grenades are distributed according to the issued licenses on 14 places for sale throughout the whaling season. In the period 1991-1994, 147 persons (fishermen and hunters, distributors and shipyard workers) have passed the course in safe handling and firing of the detonating grenade and other hunting equipment. A further 48 persons finished the course in 1999.

The overhaul programme for the harpoon cannons was successfully concluded in 1998. In 2003 there were 65 harpoon cannons on the West coast of Greenland authorised to apply for a license to go whaling. The harpoon cannons are inspected every 2 years - reducing the risks for the hunters to a minimum and maximising the efficiency when killing whales.

From March to September 2000, 9 courses were held in Greenland on the handling and instruction in the use of the new Norwegian Whale Grenade-99. All persons who completed a course on the 1985-whale grenade proto-type and newcomers were offered places on the new course which included information on how to keep the harpoon cannons in good shape. The course also included items mentioned in the Action Plan points 2, 3, 4 and 8.

From April to August 2003 an additional 9 courses on the handling and instruction of the of the Norwegian penthrite grenade (Whale Grenade-99) were held for about 75 whalers. The course also included items mentioned in the Action Plan points 2, 3, 4 and 8.

Re. Rev. Action Plan point 3: Continue to review constraints on shooting distance and relative orientation of vessel and whale and encourage reducing times to death.

Shooting distances and shooting angle are dealt with in the course in safe handling and firing of the detonating grenade. Furthermore, maintenance of the harpoon cannons is reviewed.

Re. Rev. Action Plan point 4: Continue to review the effectiveness of secondary killing methods with a view to reducing time to death in whales and encourage the application of the most effective methods.

In fin whaling the secondary killing methods is - like the first - the penthrite grenade, while in the hunt for minke whales a minimum of a 30.06 cal. (7.62 mm) rifle has proven sufficient. Some hunters use cal. .375 or cal. .458 as well.

Re. Rev. Action Plan point 8: Encourage the collection and presentation of struck and lost rates and standardised time to death records in aboriginal subsistence catches of whales and undertake the assessment of requirements for controls on the use of rifles to kill unsecured whales.

In 1992, the Greenland Home Rule Government introduced time to death in the self-reporting system for catch reports in the hunt for fin and minke whales. The regulations and catch report system are also reviewed in the course on the handling of the penthrite grenade.

Re. Rev. Action Plan point 9: Encourage the incorporation of data collection and reduction of struck and lost rates in the initiatives in Greenland relating to the beluga and narwhal hunts.

The Greenland Home Rule Government and Denmark does not recognise IWC competence on small cetacean issues, and consequently Greenland will not provide any information as to point 9.

Appendix 1

2003 QUOTA ALLOCATION TO INDIVIDUAL MUNICIPALITIES

The numbers in the quota columns are given before 1 April, and reallocations of not-used licenses took place 30 August and 15 October. Consequently, the quota of each municipality can vary from the actual total catch.

Municipality	Harpoon cannon quota	Collective hunt (rifle) quota	Total quota	No. of harpoon cannons	Settlements without harpoon cannons	Harpoon cannon strikes	Collective strikes	Total strikes
Nanortalik		6		1	6	7	7	14
Qaqortoq		4		4	4	26	5	31
Narsaq		2		3	2	23	4	27
Paamiut		3		6	1	8	3	11
Nuuk		5		8	1	21	3	24
Maniitsoq		5		8	1	16	4	20
Sisimiut		4		9	2	20	5	25
Kangaatsiaq		5		5	4	1	3	4
Aasiaat		4		4	2	4	1	5
Qasigiannguit		2		3	1	0	2	2
Ilulissat		4		10	4	2	3	5
Qeqertarsuaq		4		3	1	5	5	10
Uummannaq		5		1	6	0	5	5
Upernavik		2		0	6	0	2	2
West Greenland total	**135**	**55**	**190**	**65**[1]	**35**	**133**	**52**	**185**
Tasiilaq	0	12	12	0	-	0	13	13
Ittoqqortoormiit	0	3	3	0	-	0	0	0
East Greenland total	**0**	**15**	**15**	**0**	**-**	**0**	**13**	**13**

Note: 7 struck and lost (Sisimiut: 3; Qasugiannguit: 1, 2; Qeqertarsuaq: 3). [1] 4 boat owners with 2 harpoon cannons each.

RUSSIAN FEDERATION

(On next page)

RUSSIAN FEDERATION

1. Summary of Activities Related to the Action Plan on Whale Killing Methods (based on Resolution 1999-1)

Contracting Government	Russian Federation
Season	2003
Area	Chukotka waters
Fishery type (e.g. commerical, aboriginal subsistence, scientific permit)	Aboriginal subsistence

Summary of primary and secondary whale killing methods used
(Note that the appropriate Method No. should be used throughout the form)

Method No.	Brief description of method (e.g. penthrite grenade, 'cold' grenade, rifle *of stated calibre*, etc). Put the most commonly used method first. Insert more rows if necessary.	Used as: (state whether primary killing method, secondary, or both)
1	Harpoon with float	
2	Darting gun	
3	Rifle (various)	

Summary of criteria used to indicate unconsciousness and death

[Include brief description here]

Criteria: Visual determination of unconsciousness and death. Rifles are utilised for control (final defining) shot that guarantees death.

Summary of information providers:

Percentage of data provided by:	
• Inspectors	100%
• Scientists	Approximately 50%
• Hunters	100%
• Other (please specify)	

Summary of hunt

Item	Species 1 *Gray whale*		Species 2 *Bowhead whale*		Species 3 *[insert name]*	
	No.	%	No.	%	No.	%
Whale killing methods						
• Total no. killed (all methods summed)	126		3			
• Total killed using Method 1 only	0		0			
• Total killed using Method 2 only	0		0			
• Total killed using Method 3 only	0		0			
• Total needing secondary harpoon or other secondary killing method	126**	100	3#	100		
• If bullets used:						
- minimum number	8		50			
- maximum number	97		60			
- median number	36.9		55			
Time to unconsciousness/death (TTD)*						
• Total for which information recorded						
• Total estimated TTD to be instant						
• Maximum estimated TTD	50 mins		40 mins			
• Mean time to TTD	28.7 mins		30 mins			
• Median Time to TTD						
Other information						
• Total targeted and missed						
• Total struck and lost	2					

**Gray whales: the harpoon (Method 1) and rifles (Method 3) were used in the kill of all 126 whales. In addition, the darting gun was used in the kill of 66 (52%) of these whales.
#Bowhead whales: The harpoon (Method 1) and darting gun (Method 2) were used to kill all 3 whales. In addition, the rifle (Method 3) was used in the kill of 2 of the whales.

****NB The Resolution asks for TTD information for each whale not killed instantly. Please append these data, e.g. as Table or histogram.*** [none]

Other: Any other relevant information e.g. with information on technical assistance given to other fisheries or with respect to new studies to (a) improve methods and TTD, (b) develop new criteria for TTD: [See table above]

UNITED STATES OF AMERICA

Data provided on 2003 Bowhead Subsistence Hunt

- In 2003, 35 bowhead whales were landed. All of those whales were taken using the traditional hand-thrown darting gun harpoon with the traditional shoulder gun used as the secondary killing method.
- Thirty-one whales were landed using darting gun harpoons firing a traditional black powder projectile. Four whales were taken in Barrow using the penthrite projectile that the AEWC has been working with Dr. Egil Øen of Norway to develop.
- Six whales were struck and lost. Therefore, for 2003, the rate of efficiency of the hunt was 85%. This rate is much higher than the previous year, but as we have explained previously, weather and ice conditions play a significant role in determining the efficiency of the aboriginal bowhead whale hunts.
- It should be noted in this regard that historically the rate of efficiency in this hunt was 50%. However, the AEWC made a commitment to this Commission to increase the hunt's efficiency rate to an annual average of 75%. As with every other commitment it has made, the AEWC has not only fulfilled this promise, in recent years, it has exceeded 75% as an annual average.
- Two initiatives of the AEWC have been largely responsible for this dramatic improvement in efficiency as well as an increase in the humaneness of this hunt. First, the AEWC early on instituted a practice at its annual meetings whereby the more experienced and successful captains share their hunting techniques with each other and with the younger and less experienced hunters. This 'Hunting Efficiency Workshop' is conducted using a replica of a bowhead whale so that participants can actually demonstrate techniques.
- The Whaling Captains' Associations in individual villages conduct similar workshops each year to that village's bowhead subsistence hunt.
- The second AEWC initiative to help improve the efficiency and humaneness of this hunt is the 'Weapons Improvement Program' overseen by the AEWC's 'Weapons Improvement Committee' which is comprised of hunters, weapons experts and scientists. It is through this Program and under the supervision of the Weapons Improvement Committee that the AEWC has achieved success in adapting the penthrite-exploding projectile for use in the traditional hand-held darting gun.
- Environmental conditions for the spring and fall hunt are treacherous and cause difficulty for subsistence hunters to determine time to death with precision. During the spring, the bowhead subsistence hunt is conducted from the edge of the shore-fast ice and in the spring ice lead system. Crews use small hand-made canoes (*umiaqs*) consisting of sealskin stretched over a wooden frame and designed to hold four to six people.
- In light of the circumstances of this hunt, it can be seen that in the bowhead subsistence hunt, visual observations simply cannot yield an accurate estimate of time-to-death.
- The AEWC has made extraordinary efforts over the years to cooperate with the Commission. This commitment continues. Therefore, working with the scientists at the North Slope Borough Department of Wildlife Management, the AEWC is preparing to collaborate with researchers at the Norwegian School of Veterinary Medicine on the development of techniques to recover brain tissue samples from landed bowhead whales. As in Norway, these tissue samples would be used to study brain trauma caused by the detonation of the penthrite projectile. The AEWC hopes to follow the success of Norway in using this information as a basis for estimating time to death in the bowhead subsistence hunt.

Annex H

Report of the Conservation Committee

Wednesday 14 July and Thursday 15 July 2004, Sorrento, Italy

1. INTRODUCTORY ITEMS

The meeting took place at the Hilton Sorrento Palace Hotel, Sorrento, Italy on the afternoon of 14 July and the morning of 15 July 2004 and was chaired by Horst Kleinschmidt (South Africa). A list of participants is given in Appendix 1.

1.1 Convener's opening remarks

Horst Kleinschmidt (South Africa) welcomed delegates and observers to the inaugural meeting of the Conservation Committee. He indicated that, upon the recent withdrawal from the Commission of Carlos Dominguez Diaz (Spain), who had agreed to convene the Committee, the IWC Chair had invited him to convene the Committee.

1.2 Election of Chair

Horst Kleinschmidt (South Africa) was elected Chair.

1.3 Appointment of rapporteur

Stephen Powell (Australia) was appointed rapporteur.

1.4 Review of documents

The following documents were relevant to the discussions of the Committee:

IWC/56/CC1: Revised Draft Agenda
IWC/56/CC2: Overview of collaboration with other organisations (Secretariat)
IWC/56/CC3: A proposal for voluntary national reports on cetacean conservation (Brazil)
IWC/56/CC4: Statement regarding the Scientific Committee (DeMaster and Donovan)
IWC/56/12: Funding considerations in relation to the Conservation Committee (Secretariat)
Appendix 3: Report of the small group on the Conservation Committee
Appendices I and II of CMS (CMS)

2. ADOPTION OF THE AGENDA

The agenda, as given in Appendix 2, was adopted without amendment.

As this was the inaugural meeting of the Conservation Committee, the Chair invited members to address general issues relating to the establishment and purpose of the new Committee before turning to specific agenda items. There was consensus that all members of the IWC should be and were committed to conservation, and that the new Committee should not supervise or duplicate the work of any other bodies of the Commission. However, a range of views were expressed about the appropriateness or otherwise of the steps taken to establish the Conservation Committee. It was agreed that efforts since IWC/55 to improve the level of communication between members in disagreement were important.

Many of the co-sponsors of Resolution 2003-1, by which the Committee was established, stated that the new body should be viewed as pro-conservation, not anti-whaling. These members recognised that the Convention provides for both conservation and management of whale stocks, and believed that the establishment of the Conservation Committee did not prevent the fulfilment of either of these objectives. The conservation of whale stocks was in the common interest.

These members held the view that the establishment of the Committee would not alter or in any way impinge upon the attributions or work of any of the Commission's active bodies, nor would it change any of the functions or terms of reference of such bodies, or of the Commission itself. Rather, the primary objective in setting up the Conservation Committee in their view was to rationalise the Commission's work on that part of its agenda that deals with conservation issues, as well as to institutionalise and better distribute the Commission's workload. They emphasised that the Conservation Committee would not have any supervisory function over the work of the Scientific Committee, which has its agenda and terms of reference clearly established by the Commission.

Those who had supported the establishment of the Committee looked forward to the Committee improving the way the IWC met its responsibility for managing whales, by addressing issues not only from the perspective of whaling. To date, conservation issues had been typically addressed late in the plenary, and the Committee would allow such issues to be discussed in detail several days before the plenary. The Committee could provide advice and guidelines on conservation-related functions that were currently dispersed, and serve as a central node to identify and prioritise topics. This might prevent overload on other bodies of the Commission.

Other members, who had opposed Resolution 2003-1, indicated that they still had reservations about the establishment of the Committee, especially because in their view it took the objective of the 'conservation of whale stocks' out of the context of the objective of making possible 'the orderly development of the whaling industry.' They were committed to the sustainable use of natural resources, and viewed completion of a Revised Management Scheme to prevent over-exploitation as a higher priority conservation measure than items that might be addressed under a Conservation Committee. Their participation in the first meeting should not be construed as change of position on the Resolution.

These members stated that the process used at IWC/55 to create a new body made no attempt to bring the members of the IWC together: a mechanism to address those conservation issues which are capable of attracting widespread support ought not to have been promoted in a manner which did not effectively consult nearly half of the members of the IWC. Some efforts to discuss alternative language had been rejected out of hand, which was not conducive to open and fair dealings.

Those who had opposed the establishment of the Committee noted that, even if nothing in Resolution 2003-1 defined conservation narrowly, the wording of the Resolution and its appendix of past decisions of the Commission made it clear that the initiative would alienate nearly half of the members of the IWC. Nonetheless, members present who had opposed the process had decided to attend the first meeting, expecting a change to the name of the Committee and amendment of the original Resolution, in order to reciprocate their goodwill.

The Committee discussed the question of how to define 'conservation,' and particularly whether that should be construed as including 'sustainable use'. It was noted that various definitions were available, both from dictionaries (though there was no equivalent term in some languages), and in the texts and agreements of other treaties. While it was agreed that conservation was of interest to all members, and that further discussion on its definition would be worthwhile, a definitive answer was beyond the capacity of the Committee's first meeting. Some indicated that they had envisaged the Committee addressing issues that did not fit the remit of 'sustainable use,' while others would welcome further discussion on this.

It was noted that many members of the Commission were absent. This could be viewed as an indication of dissatisfaction with the process by which the Committee was established. Supporters of the Committee indicated that they were engaged in a constructive dialogue with some of the absent members, in the interest of seeking broad participation, and hoped that the Committee's report might demonstrate to them the value of the Committee.

3. DEVELOPMENT OF TERMS OF REFERENCE AND WORKING METHODS

3.1 Relationship between the Conservation Committee and other bodies within the Commission

Relationships between the Conservation Committee and other bodies within the Commission will be vital to the success and effectiveness of the new Committee. Relationships should be based on the principle of complementarity, not duplication.

The Chair of the Scientific Committee introduced IWC/56/CC4, expressing the view that the actions and recommendations of the Conservation Committee will be of considerable interest to the Scientific Committee, and vice versa. The statement indicates that the proceedings of all of the Scientific Committee's sub-committees and working groups have relevance to conservation.

It was clarified that the paper was not discussed at or endorsed by the Scientific Committee. Rather, it was presented by DeMaster and Donovan to aid the Conservation Committee's discussions. The issue of relationships with the Conservation Committee had not been placed on the agenda of the Scientific Committee because it was not clear how this could occur until the 2004 meeting gave such guidance. Members viewed the table of conservation-related items addressed by the Scientific Committee as helpful (see Item 4.1 below), and some noted that the Conservation Committee presented an opportunity for the Commission to address the conservation-related advice provided by the Scientific Committee more fully than in the past.

The Committee agreed that interactions with the Scientific Committee would occur in the same way that the Scientific Committee interacts with other subsidiary bodies already established by the Commission. As with the Aboriginal Subsistence Whaling Sub-committee and the first meeting of the Conservation Committee, the Chair of the Scientific Committee would attend and provide information on scientific matters that are germane to that body's work.

Relationships with the Technical Committee were also addressed. Some members viewed the reference to 'conservation' in the Rules of Procedure that relate to the Technical Committee as evidence of potential overlap with the Conservation Committee. Rule of Procedure M7 might need to be changed to avoid duplication of functions. The alternative view was that appropriate delegation of responsibility could ensure complementarity: the Commission could refer to the Technical Committee the development of proposed management measures that the Commission considered for adoption into the Schedule (i.e. matters pertaining to Article V), while referring to the Conservation Committee the development of the conservation agenda and related proposed recommendations (i.e. matters pertaining to Article VI). There were also other views on these issues.

3.2 Proposed terms of reference

Resolution 2003-1 contained three terms of reference for the Conservation Committee:

(1) the preparation and recommendation to the Commission of its future Conservation Agenda;
(2) the implementation of those items in the Agenda that the Commission may refer to it; and
(3) making recommendations to the Commission in order to maintain and update the Conservation Agenda on a continuing basis.

Many felt that these should guide the initial work of the Committee. The Committee should begin its work under these terms, and should develop additional terms if and when required. Further drafting work should proceed in an open process under the auspices of the Commission as a whole or its Chair.

Others who would prefer alternative terms of reference or who had not commented were encouraged to make specific proposals. Terms of reference for committees were typically brief, while the list of items to be addressed in the standing agenda of the Committee, generated separately, would be much more detailed.

In light of the concerns raised by those who had opposed Resolution 2003-1, a small group was formed to examine the language of the Resolution and further discuss terms of reference, outside of the Committee meeting. The group comprised the Netherlands (Chair), Australia, Iceland, Republic of Korea, Mexico, New Zealand and South Africa, and discussed concepts of conservation, ways to move forward after Resolution 2003-1, and terms of reference. The group agreed to the importance of addressing conservation in the IWC and to respect different views on whaling. Furthermore the group offered for discussion a collection of possible ways forward, including different ways of defining the concept of conservation, and various alternatives, including resolutions, that could clarify the work of the new Committee, including addressing its connection to Resolution 2003-1 (Appendix 3). This discussion should be in an open process and should be open to all IWC members. Should intersessional discussion be required, this should occur via correspondence rather than intersessional meetings.

3.3 Proposed working methods

The Committee agreed to hold annual meetings, in line with the practice of other committees and working groups. The Conservation Committee would not normally meet intersessionally, other than by e-mail when necessary.

3.4 Funding considerations

Paragraph 8 of Resolution 2003-1 charged the Committee with beginning to explore the possibility of a trust fund to make resources available both to the Commission and to Contracting Governments to implement research related to the Conservation Agenda. Discussion indicated it was premature to discuss this in detail yet. Further, it would be up to the Commission to decide whether to establish such a fund.

The Committee noted that the Secretariat had, as requested, prepared a report on funding considerations, *inter alia* the implementation of Resolutions 1998-6 on Funding of Work on Environmental Concerns and 1995-5 on the Funding of High Priority Scientific Research. This report was available to the Conservation Committee as well as to the Commission (IWC/56/12).

4. CONSIDERATION OF ITEMS TO FALL UNDER THE AUSPICES OF THE CONSERVATION COMMITTEE

The Committee recognised the value of establishing a list of items to address as part of the 'extensive conservation agenda' mentioned in its founding Resolution. The following were proposed as initial items of common interest:

- endangered species and populations;
- human impacts (e.g. noise, vessel strike, bycatch, entanglements, strandings);
- habitat protection for cetacean conservation;
- whalewatching best practice guidelines;
- reporting systems for strandings, entanglements and bycatch; and
- legal and regulatory arrangements for cetacean conservation.

Some countries argued that the list is too general and too extensive. These countries argued that conservation issues are very important, but only for a small number of species and stocks of large whales. Many species and stocks of large whales are either quite numerous or rapidly growing, and for these, in their opinion, the items on the list above are not important for conservation.

4.1 Scientific issues

Of the conservation-related items currently addressed by the Scientific Committee (listed in IWC/56/CC4), the following were identified as most germane to the work of the Conservation Committee:

- highly endangered species and populations;
- scientific research related to development of techniques for improved assessment of status and mitigation measures to potential threats where identified;
- incidental takes of cetaceans including assessment of problems at the population level and development and evaluation of mitigation measures;
- non-consumptive utilisation of cetaceans;
- whales and their environment, with an emphasis on population level effects and interaction with interpreting abundance estimates;
- sanctuaries, in particular their value to the monitoring and recovery of depleted populations;
- scientific advice relevant to enforcement and compliance with conservation measures;
- collaboration with other organisations; and
- voluntary submission of national reports on cetacean conservation (IWC/56/CC3).

4.2 Collaboration with other organisations

The Conservation Committee is directed 'to explore how the Commission can co-ordinate its conservation agenda through greater collaboration with a wider range of other organisations and conventions.' Paper IWC/56/CC2 described the major existing points of cooperation between the Commission and other organisations and conventions, which include reciprocal observer arrangements on scientific committees. The Committee could centralise collaboration, maintain an overview of those who serve as ambassadors for the IWC, and identify opportunities for new and improved collaborations.

Under this item, the Committee agreed to invite Marco Barbieri of the Secretariat to the Convention on Migratory Species (CMS), to which many IWC members belong, to address this issue. Mr Barbieri reported that CMS has been following with interest the development of the new Committee and looks forward to continuing to work closely with the IWC. A CMS-IWC Memorandum of Cooperation is in place.

5. DEVELOPMENT OF A CONSERVATION AGENDA

The Committee viewed its discussion of terms of reference, relationships with other bodies, and items to fall under its auspices as the first steps towards the development of a conservation agenda.

Brazil and Argentina proposed, through paper IWC/56/CC3, to seek voluntary reports from Contracting Governments on national actions on cetacean conservation, to provide information to subsidise a conservation agenda, in the terms of non-whaling cetacean management. In response to concerns that this might need further work, the Committee agreed to include this topic in those items under 4.1 above. Some delegations considered it premature to enter into substantive discussions, until a conclusion has been reached regarding the nature of the Conservation Committee. Other delegations disagreed with this and felt it was appropriate to start substantive discussions at this time.

6. ADOPTION OF THE REPORT

The Committee adopted the report at 09:25 on Saturday 17 July 2004.

AGENDA

1. Introductory items
   1.1 Convener's opening remarks
   1.2 Election of Chair
   1.3 Appointment of rapporteur
   1.4 Review of documents
2. Adoption of the Agenda
3. Development of terms of reference and working methods
   3.1 Relationship between the Conservation Committee and other bodies within the Commission
   3.2 Proposed terms of reference
   3.3 Proposed working methods
   3.4 Funding considerations
4. Consideration of items to fall under the auspices of the Conservation Committee
   4.1 Scientific issues
   4.2 Collaboration with other organisations
5. Development of a conservation agenda
6. Other matters
7. Adoption of the report

Appendix 3

REPORT OF THE SMALL GROUP ON THE CONSERVATION COMMITTEE

Participants: Australia, Iceland, Mexico, Netherlands (Chair and rapporteur), New Zealand, Republic of Korea, South Africa

Purpose of meeting

On request of the Conservation Committee (CC) meeting of 14 July 2004, to collect views with respect to the expectations of the work of the CC and to report back to the Committee.

The Chair identified the following subjects for discussion:

- concepts of conservation;
- ways to move forward after Resolution 2003-1;
- terms of reference of the CC; and
- possible way forward after reporting back to the CC.

Context in which we collected views

The group agreed to exchange views and opinions in an open manner, meaning no negotiation, respecting each other feelings, accepting all views expressed by the members of the informal group and defining the most broad range of options. It was discussed and accepted that existing different views with regard to whaling should be respected in trying to define common ground and possible ways to move forward.

1. Concepts of conservation

DISCUSSION

Everybody agreed with the importance of addressing conservation in the IWC.

It was further noted that the purpose of conservation can be looked at from different angles. One view is that conservation, unlike preservation, does not exclude sustainable use; another view is that conservation does not necessarily imply sustainable use but serves all kinds of purposes. A third view is that it explicitly includes sustainable use.

COLLECTED OPTIONS

(a) Define a specific IWC definition of conservation.
(b) Define conservation in relation to its different purposes: both preservation as well as sustainable use.
(c) Everyone can have their own interpretation of conservation without a fixed definition.
(d) No definition of conservation, but make explicit reference that it includes sustainable use.
(e) No definition of conservation, but make explicit reference that it includes sustainable use, specifying it by mentioning whaling, whale watching etc.
(f) No definition of conservation, but simply define a group of agenda-ideas which the committee could look at, e.g. starting with non-controversial issues like the most endangered species.
(g) A definition of conservation that is limited in specifying that conservation serves the purposes of the convention.

It was recognised that different combinations of above mentioned concepts could be made.

2. Ways to move forward with Resolution 2003-1

DISCUSSION

Everyone recognised that Resolution 2003-1 is a legal fact. It was further recognised that it is necessary to move beyond the existing *status quo* and to look at building bridges.

COLLECTED OPTIONS

(a) Accepting the *status quo* by which the CC moves forward under the present conditions.
(b) Drafting of a resolution with an instruction for work of the CC without reference to Resolution 2003-1.
(c) Drafting of a resolution in which it is clear that the work of the CC has no link with 2003-1.
(d) Drafting of a resolution with an instruction for work of the CC and which replaces 2003-1.
(e) Drafting of a resolution with an instruction for work of the CC which refers to all previous resolutions (instead of only to the ones in Annex I of 2003-1) and which recognises that conservation serves the purposes of the Convention.
(f) Drafting of a resolution which reconfirms the Conservation Committee and includes reference to a work plan.

Above mentioned options can be combined with the different options regarding the concept of conservation.

3. Terms of reference

DISCUSSION

Defining a ToR at this stage does not serve the purpose of the open discussion started on the functioning of the CC.

It was concluded that further drafting work on a ToR should proceed in an open process under auspices of the IWC or its Chair.

4. Possible way forward after reporting to the CC

DISCUSSION AND CONCLUSION

It was agreed that further discussions on the expectations of the work of the CC should be continued under the responsibility of the IWC or its Chair to ensure that all views will be taken into account in the further discussions.

Appendix 4

A PROPOSAL FOR VOLUNTARY NATIONAL REPORTS ON CETACEAN CONSERVATION

Submitted by Brazil

Introduction

The establishment of a Conservation Committee of the International Whaling Commission has opened new possibilities for the IWC to promote international cooperation and provide adequate advice for interested national governments on issues related to cetacean management and conservation.

To better assess the progress currently been made by national governments, identify cooperation opportunities and help develop the Conservation Agenda, it would be very useful to gather and analyse information provided by the governments themselves on the status of cetacean conservation and management initiatives they may wish to forward to the IWC. A parallel can be drawn with the National Progress Reports on Cetacean Research, which since their introduction in 1973 have been very useful as a Scientific Committee tool. In order to fulfil its mandate effectively, the Conservation Committee will likewise depend on the submission of information by Contracting Governments on progress with cetacean conservation.

Paragraph 31 of the Schedule already obliges Contracting Governments to transmit to the Commission copies of all their official laws and regulations relating to whales and whaling, and changes in such laws and regulations. Although this requirement is not limited to whaling-related measures, in practice not all members have transmitted their non-whaling laws and regulations affecting cetacean conservation, and these could be covered under a national cetacean conservation report. Issues such as the establishment of cetacean-related marine or freshwater protected areas, and particular management activities that could be of interest to other States facing similar challenges or willing to cooperate through either bilateral or international exchanges.

Even landlocked States, and other States with limited cetacean fauna, can and do contribute to cetacean conservation, for example through assistance with capacity building in cetacean conservation, especially in cooperation with developing States, as well as through active participation in biodiversity-related conventions other than the IWC.

National Cetacean Conservation Reports would be submitted annually for consideration by the Conservation Committee, and could subsidise its operational agenda as priority items of interest for member States are identified.

Brazil is mindful of the differing views and concerns regarding the initial operation of the Conservation Committee, and having taken these into account, would like to propose that the National Cetacean Conservation Reports be requested on a voluntary basis.

Proposal

We propose that a request be adopted by the Commission for the annual submission, on a voluntary basis, of National Cetacean Conservation Reports by Contracting Governments from 2005 onwards, to be considered by the Conservation Committee, and added to the IWC website.

These Reports should follow the format proposed in Adjunct 1 and contain information on:

- laws, regulations and other measures affecting the conservation of cetaceans;
- planning, design and designation/establishment of marine or freshwater protected areas of particular interest to cetacean conservation;
- information on whalewatching operations, its scale, target species and pertinent management issues;
- particular governmental programmes to enhance the conservation of endangered species and populations;
- data pertinent to the nature and scale of threats to cetacean conservation in their waters, and measures taken to address such threats, including, where appropriate, a summary of cooperation needs;
- systems in place for reporting of cetaceans injuries and mortality including stranding networks, incidental catch and collisions reporting frameworks;
- national activities pertaining to regional and bilateral agreements with other States relating to cetacean conservation;
- assistance to other States, especially to developing states, in the field of cetacean conservation, listing where appropriate future assistance opportunities that may become available; and
- any other information that the Conservation Committee may from time to time specify for inclusion.

The first such report should be submitted by interested parties to the Conservation Committee prior to the 57th Annual Meeting, and contain a comprehensive summary of existing laws, regulations and other measures in effect relevant to the conservation of cetaceans, and of the cetacean conservation work of the last few years. Subsequent annual reports need only contain new information.

Groups of Contracting Governments which have participated in cetacean conservation-related activities under the purview of regional organisations or agreements (such as CMS agreements) should seek to invite the organisation to submit a Cetacean Conservation Report documenting the relevant measures taken by that organisation.

The international organisations listed in Resolution 2003-1 (CMS, CCAMLR, IMO, IUCN, UNEP) should also be invited to submit regular information to the Conservation Committee on cetacean conservation issues and actions related to their field of work, preferably along the lines of the topics submitted to National Cetacean Conservation Reports.

Adjunct 1

Proposed Template for National Cetacean Conservation Reports

Country:

National Governmental Authority submitting the Report (full contact information)

1. Legal developments (laws, regulations and other regulatory measures related to cetaceans).
2. Information on whalewatching operations (scale, target species/populations and relevant management issues).
3. Current Government programs related to cetacean conservation.
4. Current threats to cetacean conservation and management measures taken/proposed.
5. Reporting systems for cetacean injuries/mortality/strandings.
6. International cooperation activities (includes bilateral or multilateral cooperation, assistance and funding programs and appropriate contact information, and other international activities of the Country submitting the Report).
7. Other (at the discretion of the Authority submitting the Report).

Annex I

Report of the Infractions Sub-Committee

Wednesday 14 July 2004, Sorrento, Italy

1. INTRODUCTORY ITEMS

The meeting took place at the Hilton Sorrento Palace Hotel, Sorrento, Italy on 14 July 2004. A list of participants is given in Appendix 1. The Infractions Sub-Committee considers matters and documents relating to the International Observer Scheme and Infractions insofar as they involve monitoring of compliance with the Schedule and penalties for infractions thereof (*Rep. int. Whal. Commn.* 29: 22).

1.1 Appointment of Chair

Sung Kwon Soh (Korea) was elected Chair.

1.2 Appointment of Rapporteur

Cherry Allison (Secretariat) was appointed rapporteur.

1.3 Review of documents

The following documents were available to the Sub-Committee.

IWC/56/Inf

1. Revised Draft Agenda
2. Secretariat: Expanded Revised Draft Agenda
3. Secretariat: National Legislation Details Supplied to the IWC
4. [Draft] Secretariat: Summary of Infraction Reports Received by the Commission in 2003
5. Quota monitoring on minke and fin whale hunting in Greenland, 2003

2. ADOPTION OF THE AGENDA

The Chair noted that in the past some delegations, including Norway and Japan, had referred to the terms of reference of this Sub-Committee and had stated their belief that Item 7.1, covering stockpiles of whale products and trade questions, was outside the scope of the Convention. Consequently, they had proposed that this item be deleted. Other delegations, including the USA and New Zealand had not agreed with this view. Nevertheless, as in previous years, it was agreed that an exchange of views might be useful and the draft agenda was adopted unchanged (Appendix 2).

3. INFRACTIONS REPORTS FROM CONTRACTING GOVERNMENTS, 2003

The Secretariat introduced IWC/56/Inf 3, the draft summary of infraction reports received by the Commission in 2003, which is given as Appendix 3 to this report.

The USA, on behalf of the Alaska Eskimo Whaling Commission, reported that 35 bowhead whales were landed in 2003, with 6 struck and lost. As explained in previous years, the weather and ice conditions play a significant role in determining the efficiency of the spring hunts. The USA reported two infractions in 2003, which occurred during an aboriginal subsistence hunt, when a female bowhead whale accompanied by a calf was taken. The female was landed whilst the status of the calf was unknown. The taking of cow-calf pairs is prohibited in Eskimo hunting tradition, and also under the regulations both of this Commission and of the AEWC Management plan. The AEWC has primary enforcement responsibility under a cooperative agreement with the Government of the USA. Following a hearing, the AEWC Commissioners concluded that the crew had not acted with proper caution and rescinded the bowhead subsistence captain's registration for two years. Further details are given in Appendix 3.

The Republic of Korea reported that the Ministry of Maritime Affairs and Fisheries and the marine police of Korea had exposed five illegal catches of minke whales in 2003 and had taken judicial and administrative measures as listed in Appendix 3. Four of the cases were deliberate, the catches being taken covertly with a spear by small fishing vessels and the fifth case was that of a dead whale found floating with spearheads stuck into it. The Korean authorities perceive these incidents to be a result of poachers trying to make money. The Government of Korea does not think poaching to be a major problem since all suspect poachers are listed and their movements watched by the police. The by-catch reporting system has proved useful in discriminating between illegal catches and by-catches. In addition, the authorities have continued to strengthen public awareness of poaching activities through the mass media. The Government of Korea will continue its efforts to bring an end to these illegal activities.

Switzerland asked whether it was legal for small harpoons to be carried on fishing vessels, as were reported to have been used in three of the infractions reported by the Republic of Korea. Korea replied that it was not permitted to carry harpoons on fishing vessels.

4. SURVEILLANCE OF WHALING OPERATIONS

The Infractions Reports submitted by the USA, the Russian Federation and St. Vincent and The Grenadines stated that 100% of their catches were under direct national inspection. Denmark (Greenland) reported on quota monitoring in IWC/56/Inf 5.

Following questions from New Zealand and the UK concerning internal legal requirements in Denmark for collection of DNA samples and actions in the event of the samples not being provided, Denmark reported that it was mandatory to supply samples, and that it had written to all municipal authorities in Greenland to inform them of this fact.

New Zealand considered that failure to collect samples should be reported as an Infraction since Article IX of the Convention requires each Contracting Government to 'take appropriate measures to ensure the application of the provisions of this Convention and the punishment of infractions against the said provisions in operations carried out by persons or by vessels under its jurisdiction' and Para 29b of the Schedule requires samples to be collected.

Denmark did not agree with New Zealand's interpretation, as Para 29b refers to small type whaling and not to aboriginal subsistence whaling. Denmark will try to take appropriate measures to ensure samples are collected in the future, but it considered that missing samples are not infractions in the sense of Article IX of the Convention. In addition, it would help if the hunters knew the samples would be put to good use, as at present many samples seem to be stored in freezers but not analysed. The Department of Fishing and Hunting will continue its efforts to collect samples.

New Zealand reiterated its opinion that collection of samples is obligatory under Para 29b of the Schedule and that failure to do so is an offence that should be reported as an infraction, particularly in view of the definition of 'small type whaling' in the Schedule and the strong language used by the Scientific Committee to express its concerns on this matter.

Following a suggestion from the Chair, New Zealand and Denmark agreed to discuss this matter further on a bilateral basis.

The UK noted that a bowhead whale was reported to have been killed in Greenland on 25 April 2004[1].

Australia expressed concern that since a new law had been enacted by Japan in 2001 allowing whales caught in nets to be killed, that the numbers of bycatch in Japan had increased dramatically, from 29 in 2000 to 79 in 2001, 109 in 2002 and to 125 in 2003. They cautioned that this could be considered an active hunt. Japan considered the question was not relevant to the Infractions Sub-Committee. Rather, the Scientific Committee is the right forum for such discussions and Japan had provided information on bycatch to that Committee. It would respond directly to Australia on this issue if asked.

The UK noted that other countries e.g. Iceland and Korea also have significant levels of bycatch. It recognised that some other countries have a different opinion as to whether bycatch should be regarded as an infraction. However, the UK believed that everyone should agree that numbers of bycaught whales should be taken off any quota and, since the quota was zero, bycatch constituted an infraction.

5. CHECKLIST OF INFORMATION REQUIRED OR REQUESTED UNDER SECTION VI OF THE SCHEDULE

This Checklist was developed as an administrative aid to the Sub-Committee in helping it to determine whether obligations under Section VI of the Schedule were being met. It is not compulsory for Contracting Governments to fill in the Checklist although, of course, they do have to fulfil their obligations under this Section of the Schedule.

The available information is summarised below:

Denmark: Information on date, position, species, length and sex is collected for between 83-100% of the catch, depending on the item. Other biological data and information on killing methods and struck and lost animals are also collected.

USA: Information on date, species, position, length, sex, whether a foetus is present, killing method and numbers struck and lost is collected for between 97-100% of the catch depending on the item. Biological samples are collected for about 50% of animals.

Russian Federation: Information on date, species, position, length, sex, whether a foetus is present, killing method and numbers struck and lost is collected for 100% of the catch.

St. Vincent and The Grenadines: Information on date, species, position, length, sex, killing method and numbers struck and lost is collected for 100% of the catch.

Norway: the required information has been submitted to the Secretariat as noted in the Scientific Committee report (IWC/56/Rep 1).

6. SUBMISSION OF NATIONAL LAWS AND REGULATIONS

A summary of national legislation supplied to the Commission is given in Table 1. The UK and the USA applauded St. Vincent and The Grenadines for adopting domestic legislation that governs the aboriginal take of humpback whales. Australia expressed similar sentiments and enquired whether the regulations met the requirements of Schedule Para 13b(4). The Secretariat believed that they do and noted that the regulations were available if Australia wished to confirm this.

7. OTHER MATTERS

7.1 Reports from Contracting Governments on availability, sources and trade in whale products

The Commission has adopted a number of Resolutions inviting Contracting Governments to report on the availability, sources and trade in whale products:

- 1994-7 on international trade in whale meat and products;
- 1995-7 on improving mechanisms to prevent illegal trade in whale meat;
- 1996-3 on improving mechanisms to restrict trade and prevent illegal trade in whale meat;
- 1997-2 on improved monitoring of whale product stockpiles; and
- 1998-8 *inter alia* reaffirmed the need for Contracting Governments to observe fully the above Resolutions addressing trade questions, in particular with regard to the problem of illegal trade in whale products, and urged all governments to provide the information specified in previous resolutions.

No reports were received by the Secretariat on these resolutions and no comments were made during the meeting.

[1] Denmark responded to a first question, which related to 2003, and said that no bowhead had been killed in 2003. It did not respond to the question of 2004 during the meeting, but subsequently reported that a bowhead whale had been seen in fishing nets in 2004 but that it had not been killed.

[1]Up to the middle of June 2004. Dates in the table refer to the date of the material not the date of submission. [2]Member states of the European Economic Community are subject also to relevant regulations established by the Commission of the European Community. The date of the most recent EEC legislation supplied to the International Whaling Commission is 1983. [3]Information on which pieces of legislation have been provided by the member countries is available on request from the Secretariat.

7.2 Other

The UK referred to six northern bottlenose whales killed in the Faroe Islands in 2002 and noted that the Scientific Committee had expressed concern over the status of this stock in the 1970s. The UK asked a series of questions requesting details of the incidents. It noted that this species is included in the Schedule (Table 3) with a zero catch limit, and believed that the killing of these whales constituted an infraction.

Denmark responded that six whales had died as a result of stranding and that such events were not infractions. Denmark has provided information on similar events on a bilateral basis on many occasions in the past and would be happy to do so again.

The UK repeated that, because the species is in the Schedule, the reasons for the kills need to be documented.

Australia notified the Sub-Committee of an alleged incident that occurred in 2004 in which a whale of unknown species was caught by an Australian fishing vessel, and the vessel returned to port with whale meat on board. The allegation has been referred to the Australian Federal Police for investigation. Australia will inform the IWC of the outcome of this matter once further details are available

No other issues were raised under this item.

8. ADOPTION OF REPORT

The report was adopted 'by post' on 18 July 2004.

   7.2 Other
8. Adoption of the report

Appendix 3

SUMMARY OF INFRACTIONS REPORTS RECEIVED BY THE COMMISSION IN 2003

Under the terms of the Convention, each Contracting Government is required to transmit to the Commission full details of each infraction of the provisions of the Convention committed by persons and vessels under the jurisdiction of the Government. Note that although lost whales are traditionally reported, they are not intrinsically infractions.

Scientific permit catches were reported to the Scientific Committee (IWC/56/Rep 1). Catch and associated data for commercial and scientific permit catches were submitted to the IWC Secretariat (IWC/56/Rep 1). Norway reported no infractions from her commercial whaling operations. Aboriginal subsistence catches and infractions are summarised in the following table.

Country	Species	Males	Females	Total landed	Struck and lost	Total strikes	Infractions/ comments
Denmark							
West Greenland	Fin	2	4	6	3	9	None
	Minke	58	117	178[1]	7	185	None
	Humpback			1			1[3]
East Greenland	Minke	1	11	13[2]	1	14	None
St. Vincent and The Grenadines							
	Humpback	1	0	1	0	1	None

	Bowhead	17	17	35[2]	6	41	2[4]
Russian Federation	Gray	70	56	126	2	128	None
	Bowhead	3	0	3	0	3	None
Republic of Korea							
	Minke			5			5[5]

[1]Includes 3 animals of unknown sex.

[2]Includes 1 animal of unknown sex.

[3]On 12 August 2003, the wildlife officer in the municipality of Ilulissat reported that a male humpback whale calf of length 9.5m had been wounded in a rifle hunt and could not be rescued. After authorisation from the Department of Fisheries and Hunting the whale was killed by a harpoon vessel and meat, blubber and qiporaq was distributed to institutions in Ilulissat. The incident was reported to the police who informed the department that they consider the incident as unsolved due to lack of possibilities of further investigation.

[4]On approximately May 25, 2003, a female bowhead whale was taken in the Beaufort Sea off Barrow, Alaska, by the crew of an Alaska Eskimo Whaling Commission (AEWC) registered bowhead subsistence captain. On taking the whale, the crew realized it was accompanied by a calf, which then swam away. The USA has elected to report two infractions as the disposition of the calf is unknown. The taking of a whale calf or a cow accompanied by a calf is prohibited by Alaskan Eskimo hunting tradition. Such a taking is also prohibited by the AEWC management plan for the bowhead subsistence hunt and by the regulations of the IWC. The AEWC considers the taking of a whale calf or a cow with a calf to be a very serious infraction. Under the AEWC Management Plan, a captain whose crew takes a calf or a cow accompanied by a calf may have his AEWC registration revoked for up to five whaling seasons or be subject to a fine of up to $10,000. On May 30, 2003, the Commissioners of the AEWC convened a hearing to receive testimony from the members of the crew and from the members of other crews who were in the vicinity when the whale was taken. While testimony indicated that the taking might have been accidental, the Commissioners concluded that the crew knew a cow-calf pair was in the vicinity and did not act with proper caution under the circumstances. Therefore, the Commissioners voted to rescind the bowhead subsistence captain's registration with the AEWC for two years (four seasons) beginning with the fall 2003 bowhead subsistence hunt. The AEWC also confiscated the baleen taken from the whale and donated it to a local organisation that supports Native artists. Under the U.S. Whaling Convention Act, it is illegal for anyone who is not a registered captain with the AEWC, or a member of the crew of a registered captain, to hunt bowhead whales. Anyone attempting to take a bowhead whale without being properly registered with the AEWC, or being a crew member of a registered captain, is subject to penalties under U.S. law.

[5]The Government of the Republic of Korea reported 5 illegal direct catches of minke whales by its nationals in Korean waters in 2003. It identified and confirmed these as infractions. The details are as follows:

i) A minke whale of length 4m was caught on 23 April 2003 by a fishing vessel permitted for offshore pot fisheries. The take was done covertly with a small harpoon at about 19 nautical miles off the port of Onsan. Penalty: the meat and fishing gear were confiscated, a fine of 7 million won imposed and the fishing licence and seamanship licence revoked. The matter is under appeal.

ii) A minke whale of length 5m was caught on 25 April 2003 by a fishing vessel permitted for offshore gillnet fisheries. The take was done covertly with a small harpoon at about 15 nautical miles off the port of Jungja. The meat was transported by another fishing vessel. Penalty: the meat and fishing gear were confiscated. The fisherman was fined 7 million won and his fishing licence revoked. The transporter was fined 4 million won and his fishing licence and seamanship licence revoked

iii) A minke whale of length 5m was caught on 18 May 2003 by a fishing vessel permitted for offshore driftnet fisheries. The take was done covertly with a small harpoon at about 15 nautical miles off the port of Ulsan. Penalty: the whale carcass and fishing gear were confiscated, a 6 month prison sentence imposed with 2 years probation and the fishing licence and seamanship licence revoked.

iv) A minke whale of length 4.1m was found dead in a driftnet on 19 May 2003 about 1 nautical mile off Ulsan city. Four harpoon heads were in the back of the whale and its tail was entangled. The whale carcass and fishing gear were confiscated but investigation failed to find the culprit.

v) A minke whale of length 8.3m was caught on 24 May 2003, by a fishing vessel permitted for offshore driftnet fisheries, at about 23 nautical miles off Youngduk city. Penalty: the whale carcass and fishing gear were confiscated, an 8 month prison sentence imposed with 2 years probation and the fishing licence revoked.

Annex K

Report of the Finance and Administration Committee

Friday 16 July 2004, Sorrento, Italy

1. INTRODUCTORY ITEMS

The meeting took place at the Hilton Sorrento Palace Hotel, Sorrento, Italy on 16 July 2004. A list of participants is given in Appendix 1.

1.1 Appointment of Chair

Halvard Johansen (Norway) was appointed as Chair of the Committee.

The Chair noted that attendance at the Finance and Administration Committee was limited to delegates and that observers were not permitted to attend.

1.2 Appointment of Rapporteurs

The Secretariat agreed to act as rapporteurs.

1.3 Review of documents

The Chair indicated that most documents had been pre-circulated but that some additional papers were newly available. The Chair briefly reviewed all the documents available to the Committee (Appendix 2). Document IWC/56/Rep1 (Extracts from the) Report of the Scientific Committee was not available since summary information on the Scientific Committee's proposed research expenditure for 2004-2005 was included in the Report of the Budgetary Sub-committee (IWC/56/F&A 3).

2. ADOPTION OF THE AGENDA

The Chair noted that under Item 6 (Other Matters), the Advisory Committee had submitted a paper to explore possible changes to NGO participation and that Brazil had requested a new item be similarly added regarding the on-going costs for delegations attending the Annual Meeting. Noting all the above changes, the Finance and Administration Committee adopted the agenda (Appendix 3).

3. ADMINISTRATIVE MATTERS

3.1 Annual Meeting arrangements and procedures

3.1.1 Need for a Technical Committee

The Chair reminded the Committee that no provision had been made for the Technical Committee to meet at Annual Meetings since IWC/51. However, the Commission had agreed to keep the need for a Technical Committee under review. He suggested that it would be appropriate to maintain the *status quo*, i.e. keep this item on the agenda since, as previously noted, the Technical Committee may have a role to play when the RMS is completed and catch limits set. The Committee agreed.

3.1.2 Use of simultaneous translation

The Chair recalled that at last year's meeting the Commission adopted by consensus, Resolution 2003-4 on the use of simultaneous interpretation at Annual Meetings of the International Whaling Commission. He invited the Secretary to present the report of the Working Group established at IWC/55 (document IWC/56/F&A 2).

REPORT FROM THE WORKING GROUP ON SIMULTANEOUS INTERPRETATION

The Secretary reminded the Committee that through Resolution 2003-4, the Commission had decided to establish a Working Group to explore the various implications for the provision of technical components for simultaneous interpretation and to make recommendations on how provision of technical components for simultaneous interpretation may be provided at the IWC to accommodate the needs of contracting parties for whom English is a second language. The Working Group was to be guided by the following Terms of Reference:

(a) to review and consider the costs as set out in document IWC/55/F&A 2 and to identify ways in which these costs could be apportioned or reduced;
(b) to recommend options and scope for the provision of technical components for simultaneous interpretation;
(c) to determine the operations and costs of other international organisations providing such components; and
(d) to consult with member states on these issues.

It was agreed that the Working Group should be open to any Contracting Government, but that it should ideally remain small and conduct its work by email. After the meeting Antigua and Barbuda, Benin, France, Gabon, Republic of Guinea, Japan, Senegal and Spain indicated that they wished to join the group. To initiate the work required, the Secretariat developed a paper for review by the Group that included:

(a) information on interpretation facilities provided by other comparable intergovernmental organisations, and costs of such provision;
(b) descriptions of different possible arrangements for providing equipment for simultaneous interpretation at IWC Annual Meetings;
(c) cost estimates for providing the different arrangements (based on cost information from Berlin, Sorrento, Ulsan and a hypothetical venue in London); and
(d) options for how such costs for IWC meetings could be met.

Although the Working Group members expressed a wide range of views in response to the Secretariat's paper regarding the extent of the service that should be provided, it was able to develop a consensus proposal on the basis that facilities for simultaneous interpretation be introduced in a phased manner. In introducing the Working Group's proposal, the Secretary noted that in accordance with previous discussions within the Commission and with Resolution 2003-4, the proposal referred only to the provision of the technical components for simultaneous interpretation, and not provision of interpreters and document translation.

In summary, the Working Group proposed that:

- initially facilities for 3 languages be provided (French, Spanish and Japanese). Japanese was proposed since most Japanese delegates speak in their mother tongue at the meetings. French and Spanish were proposed since, out of IWC's membership as of 2 July 2004, 15 countries are French-speaking and 16 countries are Spanish-speaking. In addition, requests have been made in the past for interpretation into these languages. It was further proposed that provision for additional languages could be considered at a later date (e.g. after two years);
- initially, to help reduce costs, the technical set-up used would be that where headsets would be provided only for those national delegations using simultaneous interpretation, but with a view to moving toward the usual set up where headsets are provided to all delegates;
- initially simultaneous interpretation be provided only for the Commission plenary. Provision at other meetings (i.e. Commission sub-groups and private Commissioners' meetings) could be considered at a later date (e.g. after two years). It would seem prudent, both financially and technically, to have a phased approach to provision of simultaneous interpretation; and
- the Commission would meet most of the costs through an increase in the budget provision for the Annual Meeting (approx. 2% initially). If costs are in excess of this, then the host government would cover additional expenses. In the case where the Annual Meeting is arranged by the Secretariat in the UK (in the absence of an offer from a Contracting Government), the Working Group proposed that any additional costs to provide simultaneous interpretation equipment be met by drawing on the Commission's reserves.

The Chair thanked the Secretary for presenting the report and invited members of the Working Group to comment. In doing so, they stressed the importance of this issue so as to enable effective participation of all countries regardless of their mother tongue and urged that the Commission take action.

F&A COMMITTEE DISCUSSIONS

The Committee welcomed the Working Group report, recognised the importance of this issue and agreed that some action should be taken to facilitate the participation of delegates for whom English is not their first language so as to put all member countries on the same footing. There was general agreement that the costs of providing the technical facilities for simultaneous interpretation should be met by the Commission, although a suggestion was made that, in addition, the Commission may also wish to seek voluntary contributions to support this provision.

Some members supported the approach proposed by the Working Group, although the view was expressed that if possible (e.g. by restricting the number of languages for which interpretation facilities would be provided to two rather than three), it would be desirable to extend provision of simultaneous interpretation facilities to the Commission sub-groups (not including the Scientific Committee) and the private Commissioners' meetings. Others felt that, with the increasing membership and increasing number of languages spoken by members, it would be appropriate for the Commission to take broader steps, allocating a higher percentage of the budget so as to provide, for example (and perhaps even in time for IWC/57 in Ulsan), interpretation for a greater number of languages and the translation of documents - as is the case in some other intergovernmental organisations. A number of members, however, expressed concern regarding the proposal to include translation of documents before the implications, particularly of cost, could be properly assessed. They did not believe there was sufficient time to make this assessment during IWC/56.

After a further exchange of views, the Chair proposed the following compromise:

(1) that the Committee acknowledges the importance of facilitating the effective participation of all Contracting Governments in the work of the Commission and that no government should be disadvantaged by language;
(2) that in the first instance, equipment facilities for the provision of simultaneous interpretation facilities be provided for French and Spanish for the Commission's sub-groups (but not the Scientific Committee), the Commission plenary and private Commissioners' meetings. This would come into effect in time for IWC/57 in Ulsan next year;
(3) that the budget provision for the Annual Meeting would be increased by 2%, as recommended by the Working Group; and
(4) that the Secretariat should work intersessionally, with a small Task Force (composition to be decided), to develop cost estimates and implications for the provision of document translation at Annual Meetings and to report to the F&A Committee at IWC/57 in Ulsan for possible decision-making.

The Committee agreed to recommend this to the Commission.

3.2 Amendments to the Rules of Procedure

3.2.1 Election of the Chair and Vice-Chair of the Commission

Japan introduced the following proposals concerning Rules of Procedure F.1 and G.1:

> Amendment of Rule F.1: that the text be amended such that the Chair may be elected from among the Commissioners and Alternate Commissioners. The specific text of this proposal is that line 1 of rule F.1. be amended to read: ***The Chair of the Commission shall be elected from time to time from among the Commissioners and Alternate Commissioners and shall…***

> Amendment of Rule G.1.: that the text be amended such that the Vice-Chair may be elected from among the Commissioners and Alternate Commissioners. The specific text of this proposal is that line 1 of rule G.1 be amended to read: ***The Vice-Chair of the Commission shall be elected from time to time from among Commissioners and Alternate Commissioners and…***

A number of governments indicated that while they appreciated and understood the motivation behind the proposed amendments, they considered - as pointed out when this same matter was raised at IWC/54 in Shimonoseki - that the proposal was contrary to Article III.2 of the Convention and therefore illegal.

Japan noted this position. It indicated that it did not wish to pursue the matter any further now, but may raise it in the Plenary.

3.2.2 Other – appointment of the Chair and Vice-Chair of the Scientific Committee

PROPOSAL FROM THE SCIENTIFIC COMMITTEE

At the 2002 Scientific Committee meeting, the Scientific Committee developed a proposed procedure and amendment to the Rules of Procedure for the Scientific Committee regarding the appointment of its Chair and Vice-Chair. It was proposed that a second paragraph be added to Rule of Procedure C.5 of the Scientific Committee as follows (proposed new text in *italics*):

C. Organisation

5. The Committee shall elect from its members a Chair and Vice-Chair who will normally serve for a period of three years. They shall take office at the conclusion of the annual meeting at which they are elected. The Vice-Chair shall act for the Chair in his/her absence.

The election process shall be undertaken by the heads of national delegations who shall consult widely before nominating candidates. Under normal circumstances, the Vice-Chair will become Chair at the end of his/her term, and a new Vice-Chair will then be elected. If the election of the Chair or Vice-Chair is not by consensus, a vote shall be conducted by the Secretary and verified by the current Chair. A simple majority shall be decisive. In cases where a vote is tied, the Chair shall have the casting vote. If requested by a head of delegation, the vote shall proceed by secret ballot. In these circumstances, the results shall only be reported in terms of which nominee received the most votes, and the vote counts shall not be reported or retained.

The rationale of the Scientific Committee for this recommendation was that a reporting of the actual vote has the potential to erode the confidence the Scientific Committee would have for the new Chair. It was also recognised that where three or more candidates were nominated, the potential for multiple votes exists and again the potential exists to erode the confidence the Scientific Committee would have for the new Chair.

In the Scientific Committee Report, it was also noted that in years when elections are required, the Chair will indicate a provisional date for the election in the initial draft agenda circulated to the Scientific Committee. The election process, as noted above, will be undertaken by the heads of the national delegations (*J. Cetacean Res. Manage 5* (suppl.): 450).

In 2002 when the proposed amendments to the Scientific Committee's Rules of Procedure were submitted to the Commission's Finance and Administration Committee, concern was expressed by a number of governments regarding the proposal that results from secret ballots would only be reported in terms of which nominee received the most votes and that the vote count would not be reported or retained. Given that the F&A Committee was evenly divided on the issue and that another election was unlikely to arise in the next three years, it agreed to refer the issue back to the Scientific Committee for further consideration. The Commission agreed.

The Heads of Delegation met during the IWC/56 Scientific Committee meeting and reconfirmed by consensus the Committee's support for its earlier position regarding secret ballots. They also agreed that the proposed Rule of Procedure should be revised to indicate that it was expected that the Vice-Chair would become Chair at the end of his/her term unless he/she declined.

The Heads of Delegation to the Scientific Committee therefore recommend that the following amended text be put forward to the Commission via the F&A Committee for adoption (proposed new text in ***bold italics***):

The election process shall be undertaken by the heads of national delegations who shall consult widely before nominating candidates. ~~Under normal circumstances~~, ***T***he Vice-Chair will become Chair at the end of his/her term ***(unless he/she declines)***, and a new Vice-Chair will then be elected. ***If the Vice-Chair declines to become Chair, then a new Chair must also be elected.*** If the election of the Chair or Vice-Chair is not by consensus, a vote shall be conducted by the Secretary and verified by the current Chair. A simple majority shall be decisive. In cases where a vote is tied, the Chair shall have the casting vote. If requested by a head of delegation, the vote shall proceed by secret ballot. In these circumstances, the results shall only be reported in terms of which nominee received the most votes, and the vote counts shall not be reported or retained.

A notification of the proposed changes in the Rules of Procedure of the Scientific Committee was included in the draft agenda for the Scientific Committee and circulated to all Scientific Committee delegates in advance of the meeting. Therefore, if approved by the Commission, the proposed changes to the Scientific Committee Rules of Procedure would go into effect at SC/57.

F&A COMMITTEE DISCUSSIONS

The F&A Committee endorsed the Scientific Committee's proposal and recommends that it be adopted by the Commission.

4. FORMULA FOR CALCULATING CONTRIBUTIONS

The Chair recalled that at its meeting last year, the Commission agreed that the Contributions Task Force should meet again prior to IWC/56 to try to finalise a proposal for a revised contributions formula and that the Task Force had been scheduled to meet in late May 2004. He noted however, that the Commission had also agreed to allow Henrik Fischer, Chair of the Commission, to convene a small group to explore ways of taking the RMS process forward. This included a discussion on how RMS costs might be apportioned. It was noted that the Commission has always recognised the interaction between the work of the Task Force and RMS cost discussions, but that until now, the Task Force has been asked to develop a contributions formula that does not take future RMS costs into account. However, given the intersessional work of the Commission Chair and its potential implications for any revised contributions formula, Henrik Fischer believed that it would be prudent to delay further work of the Task Force until these implications could be assessed. Consequently, while continuing to recognise the high priority the Commission gives to the development of a revised contributions formula, it was decided to postpone the Task Force meeting after consultation with the Task Force members and with the Advisory Committee.

While recognising the sense of postponing the May 2004 Task Force meeting, a number of delegations stressed the importance of completing the work on a revised financial contributions formula expeditiously.

There was some discussion regarding the Chair of the Task Force, given that Daven Joseph (Antigua and Barbuda) was no longer Commissioner or representing Antigua and Barbuda. There was some debate as to whether Chairs are appointed as individuals or as countries and whether Task Force Chairs should be appointed by the Commission or elected by the group itself. Noting these different views, the F&A Committee Chair proposed that the new Commissioner for Antigua and Barbuda convene a meeting of Task Force members over lunch to elect a Chair. The Committee agreed with this proposed approach and, following the short Task Force meeting, the convenor was able to report that by consensus, the Task Force recommended that, if the Commission so wishes, the Task

Force continue with the Commissioner for Antigua and Barbuda (Anthony Liverpool) as Chair and with the Commissioner for Argentina (Eduardo Iglesias) as Vice-Chair.

The F&A Committee agreed to recommend this to the Commission.

5. FINANCIAL STATEMENTS, BUDGETS AND OTHER MATTERS ADDRESSED BY THE BUDGETARY SUB-COMMITTEE[1]

5.1 Review of the Provisional Financial Statement, 2003/2004

5.1.1 Report of the Budgetary Sub-committee

The report of the Budgetary Sub-committee (IWC/56/F&A 3) was introduced by its Chair Jean-Pierre Plé.

The Sub-committee had discussed intersessionally the Provisional Financial Statement presented in IWC/56/14.

The Secretariat introduced updated tables for IWC/56/14 and reviewed briefly the changes that had occurred to produce an updated out-turn for 2003/04. Total income has risen from £1.624m to £1.657m mainly due to financial contributions from new members and additional penalty interest. Operational expenditure has risen from £1.501m to £1.526m due to increases in Secretariat costs (£6.1k - mainly maintenance) and £19.1k in research expenditure (mainly items deferred from previous financial years which had already been funded). This gives an increase in the surplus of income over expenditure (before movement to/from reserves) from £78.6k to £86.0k (i.e. a net increase of £7.4k).

5.1.2 Secretary's report on the collection of financial contributions

The Secretariat referred to document IWC/56/F&A 4. Total financial contributions and interest outstanding amounted to £592k, of which £138k referred to former members and £453k referred to current members. The majority of the debt of current members relates to three countries, i.e. Costa Rica, Kenya and Senegal. The Secretariat reported that the majority of countries with arrears had made significant efforts to clear their debts with Kenya entering into a repayment schedule. The Secretariat stressed that the information in IWC/56/F&A 4 was subject to rapid change and was in fact already out of date since further funds had been received just prior to the meeting.

The Secretariat noted that approximately 90% of financial contributions for the Financial Year 2003-04 had been received by the due date for settlement (28 February 2004). The charging of penalty interest of 10% for late payments and the loss of voting rights has provided a strong incentive for members to pay on time.

5.1.3 F&A Committee discussions and recommendations

The Committee noted that the provisional statement shows a generally satisfactory situation and accordingly recommends to the Commission that the Provisional Financial Statement (Appendix 4) be approved subject to audit.

The Secretary's report on the collection of financial contributions was noted by the Committee. Concern was expressed that the 10% penalty interest charge presented difficulties to developing countries. The fixed rate of 10% interest was questioned at a time when market rates of interest are much lower. However, it was noted that the penalty interest provides a strong incentive to some national finance ministries to pay on time. The Chair commented that these conditions are included within the Financial Regulations, but noted the request from some Committee members that the continued use of penalty interest be reviewed by the Commission. An inquiry was received regarding the status of repayment schedules allowed by Financial Regulations, which allow members to regain voting rights. The Secretariat indicated that Financial Regulation F5(e) detailed the relevant procedures. It was noted that the relationship between financial contributions and voting rights would be one of the issues addressed at the private Commissioners' meeting on Sunday 18 July.

5.2 Consideration of estimated budgets, 2004/2005 and 2005/2006, including the budget for the Scientific Programme

5.2.1 Report of the Budgetary Sub-committee

REVIEW OF PROPOSED BUDGET 2004-2005 AND FORECAST 2005-2006

This aspect of the work done by the Budgetary Sub-committee was introduced by its Chair Jean-Pierre Plé. He highlighted the main factors affecting the formulation of the 2004/05 proposed budget which were as follows:

Income: The total amount required from Contracting Governments to 'balance' the budget does not necessarily mean a zero deficit or surplus for the year, rather that the resulting deficit or surplus is in line with the Commission's decisions.

Two scenarios were presented to the Budgetary Sub-committee intersessionally. An increase in financial contributions of 7.9% would have allowed income to equal expenditure (before transfers to/from reserves). An increase in financial contributions of 4.9% would result in expenditure exceeding income (before transfers to/from reserves) but would still leave the General Fund at the target level of 50% of operating costs. The lower increase was regarded more favourably and was used in the proposed 2004-2005 budget in document IWC/56/14.

Expenditure: The proposed 4.9% increase in Financial Contributions is due to necessary increases in expenditure on items deferred from previous years (e.g. essential repairs and renewals to fixtures and fittings and computer equipment) and scale increments allowed within staff contracts. It also includes costs for the construction of a new meeting room (to allow more intersessional meetings to be held at the Secretariat and so reduce costs for the Commission). Much of this expenditure is specific to 2004/05 only, which accounts for the reduction in expenditure in the 2005/06 forecast.

The Budgetary Sub-committee Chair noted that the response of the Sub-committee to these main items of income and expenditure in the 2004/05 proposed budget were as follows.

- The proposed increase in Financial Contributions of 4.9% (in the context of the proposed one off expenditure referred to previously) was regarded as being broadly acceptable. Attention was drawn to the fact that the total increase of 4.9% did not apply uniformly to contributing

[1] £k denotes thousands ('000); £m denotes millions ('000,000).

countries once the effects of the Interim Measure are taken into account. It was further noted that as 2004/05 completes the series of reductions put into effect by the Interim Measure, increases for 2005/06 onwards would affect all countries uniformly.

- The replacement of the boiler was considered essential.
- The concept of the meeting room was well received with the following observations being made:
  - (i) the immediate benefit of the meeting room will depend on the decisions reached in Plenary regarding the need for intersessional meetings in association with the Revised Management Scheme (RMS) and the Contributions Task Force;
  - (ii) construction of the meeting room, if approved, should commence as soon as possible;
  - (iii) all future intersessional meetings should be held in the new Secretariat meeting room, whenever possible, to maximise the use of the resource and thereby minimise costs to the Commission;
  - (iv) the lease of the Red House will be open to re-negotiation in 5 years time. Even if the meeting room is only used for those 5 years, the future savings would still far exceed the modest outlay of £8.75k in 2004/05;
  - (v) the Scientific Committee should be encouraged to use the new meeting room for its intersessional meetings when ever practicable; and
  - (vi) the new meeting room should be wired to take advantage of the new ASDL service (fast internet access) and thereby allow visitors access to an increasingly necessary facility.
- The Sub-committee recognised that the proposed budget did not reflect a potential 2% increase in the Annual Meeting budget proposed by the Working Group on Simultaneous Interpretation to cover costs for the provision of interpretation facilities.

Given the above, the Sub-committee considered that, pending detailed consideration of the funding request from the Scientific Committee for research, the proposed budget for 2004-2005 was acceptable. It also considered the forecast for the following year appropriate - the forecast budget for 2005/06 used the proposed budget for 2004/05 as its base, with expenditure increased by an assumed UK inflation rate of 3% where applicable. Financial Contributions were increased by 1.7% over the proposed 2004/05 level to produce a balanced budget (before transfers to/from reserves).

The Chair of the Sub-committee reminded the Finance & Administration Committee that it was required to make a specific recommendation on the level of NGO and media fees for 2004/05. The Secretariat had used levels of £590 and £35 respectively based on the procedure used in 2003/04 for determining the level of increase in these fees by linking them to the rate of UK inflation (3% used for budgeting purposes). The Sub-committee agreed that the levels originally outlined by the Secretariat should be adopted. Accordingly the Sub-committee **recommended** that for 2004/05 the NGO fee be set at £590 and the media fee at £35.

RESEARCH EXPENDITURE PROPOSED BY THE SCIENTIFIC COMMITTEE FOR 2004-2005

The Budgetary Sub-committee Chair explained that the Scientific Committee had identified projects totalling £374.35k, which it considered necessary to properly carry out the Commission's requirements. However, he noted that the Committee recognised the financial constraints that applied, and accordingly had prepared a reduced list of items to get as near as possible to the target, which had been set at £238k. The Scientific Committee had developed a reduced budget of £240.85k and 'strongly recommended that, at a minimum, the Commission accepts its reduced budget of £240.85k'.

The Budgetary Sub-committee Chair drew attention to the generous voluntary contribution from Japan of £32k towards the SOWER cruise series, without which key equipment would not be purchased or Invited Participants funded to attend an important intersessional meeting to review results to date and to plan future work. He further noted that the priorities of the Scientific Committee were accepted by the Sub-committee, and that the Sub-committee agreed to include the Scientific Committee's £240.85k 'package' in the proposed budget for 2004-2005 (Annex M).

The Sub-committee therefore **recommended** that the Finance and Administration Committee consider and forward the proposed budget for 2004-2005 (Annex L) to the Commission with a recommendation that it be adopted, together with the indicated level of financial contributions from Contracting Governments. (A preliminary estimate of the contribution to be requested from individual governments is given in Appendix 5. Note however, that this is indicative only and subject to adjustment and confirmation in the light of e.g. actual meeting attendance).

5.2.2 F&A Committee discussions and recommendations

2004-2005 PROPOSED BUDGET

The 2004-2005 proposed budget was generally acceptable to the Committee.

Norway considered that the proposed increase in contributions of 4.9% was too high while Germany regretted that the proposed budget showed any increase at all. The necessity for annual meetings was also questioned (Germany, Norway, Ireland) with bi-annual or even tri-annual meetings suggested as alternatives. Ireland noted its intention to submit a Resolution to Plenary on this matter. The need to build a meeting room was questioned by Norway who believed that intersessional meetings should be reduced as far as possible.

With regard to the 2004-2005 proposed budget for research expenditure, the inclusion of £14.5k to support a workshop on the use of market sampling to estimate bycatch was not supported by Japan and Norway. Others believed this to be a very important piece of work related to the RMS, and asked that the Scientific Committee Chair or Secretariat's Head of Science provide further explanation. The Head of Science noted that there is a requirement in the Scientific Committee when recommending a catch limit to adjust downwards the safe removals level calculated by the *Catch Limit Algorithm* by expected levels of anthropogenic removals such as bycatch. In recent years the Committee has received a number of papers using a market sampling approach and it has never been able to reach agreement over whether or not market based approaches are useful for estimating bycatch levels in an

RMP context. The Scientific Committee therefore believes it to be important to try to resolve this issue and that the best way to achieve this is through a dedicated workshop. The objectives of this methodological workshop are to:

(1) review available methods that have been used to provide estimates of large cetacean bycatches via market samples, including a consideration of their associated confidence intervals in the context of the RMP; and
(2) provide advice as to whether market-sampling-based methods can be used to reliably estimate bycatch for use in addressing the Commission's objectives regarding total removals over time and, if so, the requirements for such methods.

The Head of Science emphasised that the terms of reference for the proposed workshop limited interest in the question of markets to the context of an evaluation of whether or not market data can be used to provide reliable estimates of bycatches. However, Japan thought that what might start as a methodology might rapidly become unworkable. Japan also believed that the market approach would not be useful and in addition was outside the Terms of Reference of IWC.

NGO AND PRESS FEE

The recommendation to set fees for 2004-2005 of £590 for NGOs and £35 for media was agreed by the Committee. The Chair of the Budgetary Sub-committee clarified that these increases were based on the UK inflation rates used in the 2004-2005 budget.

2005-2006 FORECAST BUDGET

The 2005-2006 forecast budget was noted by the Committee.

SUMMARY OF RECOMMENDATIONS TO THE COMMISSION

The F&A Committee **recommends** that:

- the proposed budget for 2004-2005 (Annex L) be forward to the Commission for its consideration and with a recommendation that it be adopted, noting the reservations of Norway, Japan and Germany;
- for 2004-2005, the NGO fee be set at £590 and the media fee at £35; and
- the Commission takes note of the Forecast Budget for 2005-2006.

5.3 Secretariat offices

5.3.1 Report of the Budgetary Sub-committee

The Chair of the Budgetary Sub-committee reminded the Committee that at IWC/55, the Sub-committee had recommended that the Secretariat explore a range of alternatives, including:

(1) continuing to rent the Red House;
(2) purchasing the Red House or another suitable property in Cambridge or elsewhere in the UK; or
(3) relocation of the Secretariat to another member country;

and report back to the Budgetary Sub-committee. He noted that the background to this is that the cost of the Secretariat represents a significant percentage of the IWC's budget (i.e. £958k out of £1,623k of operating expenditure - as per the 2002-03 audited accounts). The rental of Red House (i.e. £69k) represents 4.3% of the £1,623k of operating expenditure, while salaries, and allowances (i.e. £622k) represent 38% of the £1,623k of expenditure.

The Red House is a large suburban house, which has been converted to office use with a warehouse added, giving a total area of 552 square metres (5,946 square feet). The building provides a functional environment for the work of the Secretariat. As this type of property has successfully met the needs of the organisation since 1976, the use of similar property in other parts of the world seemed an appropriate basis for comparison. Two countries were selected from each of the economic groupings used to assess capacity to pay as part of the calculation of Financial Contributions. Countries were further selected to reflect the geographical distribution of the membership. Properties in suburban locations of the capital cities of the selected countries were sought (or a comparable international location). A variety of property types and locations within the UK were selected to demonstrate the choice available and associated costs. The countries chosen for this comparison included: Argentina, Australia, Japan, Panama, Senegal, South Korea, Switzerland and the USA.

An assessment for the purchasing of property in the UK and other countries had not been included in the review. Differences in property law, methods of selling, availability and taxation made the accumulation of sufficient information very difficult to allow a meaningful comparison of property purchases to be made in the time available. In the case of renting property, there was sufficient information available to allow a broad comparison to be made.

The report examined the criteria for relocation within the UK and overseas and the associated variables (rents, wind-up costs, set-up costs, transition costs, loss of expertise and effects on organisational effectiveness etc). It concluded that:

- Currently there are savings to be made from relocating the IWC abroad, both in terms of lower rental costs and local salaries. The savings however may be sensitive to currency/economic fluctuations. Savings in expenditure in the early years of relocation could easily revert to additions to expenditure in later years.
- Over the transition period it is possible that transition costs (e.g. paying rent on two properties – if relocation occurred before the current lease expired) would equal or even exceed cost savings.
- If the current lease is continued until 2009, the rent will be capped at around £73,700 per annum from June 2005. This will give stability to costs and still provide a competitive rent in relation to alternative sites in the Cambridge area.
- The renewal of the lease in 2009 offers the chance to re-negotiate the current terms. The current lease only allows increases in rent. The chance to reduce the rent and allow rent decreases at each 5 yearly rent review could be explored.
- The focus of much of this paper has been on the relative costs of property and the relative costs of operating in various parts of the world. The costs associated with losing staff with the operational expertise and relationships that have been developed over many years should also be taken into consideration.
- The volatility of international markets make budgeting over a long time frame problematic. An effective Secretariat needs stability to function effectively and so its location should be considered within a long-term perspective. A country that can offer a stable cost base

allied to operational effectiveness should give an acceptable balance between value and performance in the face of fluctuations in the world economy.

The Sub-committee had acknowledged that rent represented approximately 4% of the total budget, and was not an excessive cost. The need to retain expertise within the Secretariat was recognised and that this would be lost if the Secretariat were moved away from the Cambridge area. As there is still over 5 years until the current lease expires, the Sub-committee recommended that the Secretariat explore alternatives within the Cambridge area which might include:

- To ask the NASCO (North Atlantic Salmon Conservation Organisation) Secretariat in Edinburgh, Scotland how it managed to purchase its Headquarters building in terms of funding and what effect their status as an International Organisation had in buying property. (Financing any purchase would have to be carefully considered in the context of minimising the effects on Financial Contributions).
- Near the date of renewal of the lease, to see if there might be any scope for the owners of Red House to 'gift' the property to the IWC. This might be an option if the inheritance tax status of the owner made this option advantageous.
- To keep the property market in Cambridge under active review to allow the early assessment of rental or purchase alternatives.
- If new property was acquired, to assess the possibility to renting part of that property as a means of minimising total property costs.

5.3.2 F&A Committee discussions and recommendations

The Committee accepted the report as presented and recommends to the Commission that the Secretariat be asked to investigate the feasibility and options for purchasing/acquiring premises suitable for office accommodation in the Cambridge area and to report back to the Budgetary Sub-committee next year.

5.4 Budgetary Sub-committee rota

5.4.1 Report of the Budgetary Sub-committee

The Sub-committee Chair recalled that at IWC/54 in Shimonoseki in 2002, the Commission adopted a rota for membership of the Budgetary Sub-committee. In summary:

- using the same country groupings as the Interim Measure for Financial Contributions[2], membership comprises:
  - 2 members from Group 1
  - 2 members from Group 2
  - 2 members from Group 3
  - Japan, USA + one other from Group 4
- membership is for 2 years (except for Japan and the USA who have a 'permanent' place since they are likely to be the two highest paying contributors under almost any formula for the calculation of financial contributions for the foreseeable future being the highest payers now and probably in the future);
- any member that declines to serve to be replaced by the next member in alphabetical sequence within its Group;
- new members of the Commission to be fitted into the cycle at the nearest alphabetical point after they have had a period in which to familiarise themselves with the organisation; and
- the appointment of the Sub-committee Chair should be handled by the Chair of the Commission and the Advisory Committee.

He noted that at its meeting at IWC/55 last year, the Commission agreed that the Secretariat review the current rota system with a view to:

(1) making it more attractive for countries to serve on the Sub-committee;
(2) providing greater continuity;
(3) improving the process for selection of the Sub-committee Chair; and
(4) reporting back to the Budgetary Sub-committee for further action as appropriate.

At its meeting this year, the Sub-committee reviewed a variety of options put forward by the Secretariat for consideration regarding items (1) to (3) above and recommended to the F&A Committee that the following be incorporated into the membership rota system:

TO ENCOURAGE PARTICIPATION IN THE SUB-COMMITTEE

A. When inviting countries to serve, stress not only the importance of the work of the Sub-committee (it really does make the job of the F&A Committee much easier and more efficient), but also that the workload is not high - either intersessionally or at Annual Meetings. The Sub-committee is only active during the period from March to when the annual meeting is held – and this only involves responding to documents/ proposals from the Secretariat. All intersessional work is done by email/fax and no intersessional meetings are involved. At annual meetings, the Sub-committee generally meets for only 1-2 sessions.

B. Undertake to schedule meetings of the Budgetary Sub-committee when other Commission sub-groups are not meeting and try to avoid scheduling the Budgetary Sub-committee at the beginning of the series of Commission sub-group meetings (because not all delegations arrive in time to otherwise participate).

C. Keep the four economic groups, but add two 'open seats' (i.e. for any interested countries) as a fifth category. Countries filling the two open seats would need to be identified and agreed at the meeting of the Finance and Administration Committee. Formalise the current informal arrangement allowing Contracting Governments not members of the Budgetary Sub-committee to attend meetings as observers.

TO PROVIDE GREATER CONTINUITY

D. Extend the term of members from 2 to 3 years.

E. Appoint not only a Sub-committee Chair but also a Vice-Chair. Under normal circumstances, the Vice-Chair would replace the outgoing Chair. This would have the effect of 2 Sub-committee members serving for either 4 years (under the

[2] It is recognised that these country groupings were developed solely for the purposes of the Interim Measure for calculating financial contributions and may need revision when a new formula is adopted.

current system) or 6 years if the term of all members was extended as proposed in D above.

IMPROVING THE PROCESS FOR THE SELECTION OF THE SUB-COMMITTEE CHAIR AND VICE-CHAIR

F. That the Sub-committee elects its own Chair (as is the case in other Commission sub-groups – and indeed the Commission itself).

5.4.2 F&A Committee discussions and recommendations

Several countries expressed an interest to join or continue participating in the work of the Budgetary Sub-committee. The question was raised as to how long an 'open seat' as proposed in C above might be open to an interested country and clarification was sought as to the status of observers. It was agreed that both these aspects required clarification and that the Budgetary Sub-committee should be asked to do this intersessionally (see recommendations below).

The F&A Committee therefore recommends to the Commission:

- That items A to F in section 5.4.1 above be incorporated into the membership rota system with the aim of: making it more attractive for countries to serve on the Sub-committee; providing greater continuity; and improving the process for the selection of the Sub-committee Chair (and now Vice-Chair).
- That Germany and Norway be invited to take the 'open seats' commencing immediately following IWC/56.
- That the Budgetary Sub-committee provide clearer guidelines for its operation and to report its conclusions back to the F&A Committee next year.

The proposed rota for the budgetary Sub-committee for 2004/05 onwards is given as Appendix 6.

6. OTHER MATTERS

6.1 NGO participation

6.1.1 Discussion document from the Advisory Committee

Richard Cowan (UK) introduced document IWC/56/F&A 6 'Discussion paper on rules governing participation of non-governmental organisations in the International Whaling Commission' on behalf of the Advisory Committee. He explained that in September last year, the Secretariat had been approached by a representative of one of the large environmental NGOs regarding changes that a number of them would like to rules of NGO accreditation in particular but also in their level of participation in Commission affairs. The Secretariat had brought this matter to the attention of the Advisory Committee to seek advice on the best way to proceed. The Advisory Committee agreed that this issue should be brought to the attention of the Finance and Administration Committee, and that the best way to do this was for it to develop a paper outlining the issues raised and the potential implications of these. He noted that the focus of the paper is on NGO participation in the Commission and its sub-groups excluding the Scientific Committee, and that the intention was for the F&A Committee to have a general discussion on the matter at this year's Annual Meeting and further that if changes are suggested, decisions could be taken at IWC/57 next year, as appropriate.

It was noted that the discussion document addressed the four following issues.

(1) Removal of the requirement that non-governmental organisations maintain offices in more than three countries.
(2) Allowing accredited NGOs to send up to [five?] representatives to IWC meetings as observers with the possibility of all observers being in the meeting room at any one time.
(3) Revising the fee structure for NGOs, such that the effect of the changes listed above is fee-neutral (cost-neutral?) in the year of its introduction and that thereafter, fees should not in general increase by more than such an amount as is necessary to keep pace with inflation in the UK (as host country to the IWC).
(4) Formally confirming the right of NGO representatives to speak at IWC meetings, but with some limitation on the number of interventions that could be made.

Richard Cowan stressed that, should the Commission decide to consider whether, and if so how, its Rules of Procedure might be amended to accommodate the wishes of some NGOs for more active participation, certain requirements are paramount, i.e. that changes in the rules should not:

- impede the orderly and timely conduct of business in meetings of the Commission or its subsidiary bodies;
- result in an increase in the IWCs costs nor a diminution in its income; or
- significantly increase either the number of NGO observers present at meetings, nor the volume of documentation which the IWC Secretariat is required to produce to accommodate them.

6.1.2 F&A Committee discussions

A range of views were expressed by members of the Committee. Some believed that NGOs have a valuable contribution to make, strongly supported a move to liberalise the rules for NGO participation in the IWC, and considered that each of items 1-4 listed above should be further investigated. They considered that transparency of decision-making at an international level is important and particularly important now with respect to IWC. Removal of the requirement for NGOs to have offices in at least four countries and allowing NGOs to have more than one observer present in the meeting room (items 1 and 2) were particularly supported as this should remove the tendency for some NGOs to participate under 'flags of convenience' organisations.

While not proposing to exclude NGOs, others noted that the IWC is an organisation of governments, that NGOs already have sufficient influence and that the current rules are adequate. They were concerned that the changes related to items 1 and 2 would lead to a significant increase in the numbers of NGO representatives attending meetings (with significant cost implications) and noted that governments are at liberty to include NGOs in their delegations. On this last point, others noted that since NGOs included on national delegations are required to abide by that government's position, it is important that NGOs also be allowed to attend as observer organisations.

Given the discussions, the Chair concluded that IWC is already transparent since it is open to observers from non-member governments, other intergovernmental organisations, NGOs and in the case of the Plenary, also to the media. He noted that some members had serious concerns regarding the granting of speaking rights to NGOs, but suggested that further consideration might be given to items

1 to 3 above. He therefore proposed that the Secretariat work with the Advisory Committee intersessionally to explore how items 1-3 might be implemented and to report to the F&A Committee next year, together with any recommendations as appropriate. He noted that it would be necessary for the Secretariat to consult with NGOs on this issue. He suggested that the issue of speaking rights be set aside for the time being. The Committee supported this proposed approach and agreed to recommend it to the Commission. The Committee also supported the suggestion that if Contracting Governments do not consider that the pre-conditions listed under the three bullet points above cover all of their concerns, they should be invited to contribute proposals for further pre-conditions that would help in limiting/better defining NGO attendance.

6.2 Costs involved in participation at Annual Meetings

Brazil briefly drew attention to its concern regarding the costs incurred to Contracting Governments, especially those of developing countries, of sending delegations to Annual Meetings, particularly given the length of the meeting series. It hoped that host governments and the Secretariat could take such concerns into account when determining the timing and location of Annual Meetings. This was supported by a number of other governments.

The Committee took note of this concern and agreed to draw it to the attention of the Commission.

At the end of the meeting, St Kitts and Nevis announced that it intends to offer to host the Annual Meeting in 2006.

Appendix 6

PROPOSED BUDGETARY SUB-COMMITTEE ROTA FOR 2004/05 ONWARDS

The table below shows a possible rota that would result from the proposals made in section 5.4.1 of the F&A report. This rota incorporates the existing structure as modified by the proposed changes.

Membership would consist of:

- 2 members from Group 1;
- 2 members from Group 2;
- 2 members from Group 3; and
- Japan, USA + one other from Group 4.

- Membership is for 3 years (except for Japan and the USA who have a 'permanent' place since they are likely to be the two highest paying contributors under almost any formula for the calculation of financial contributions for the foreseeable future, being the highest payers now and probably in the future).
- Any member that declines to serve to be replaced by the next member in alphabetical sequence within its Group.
- New members of the Commission to be fitted into the cycle at the nearest alphabetical point after they have had a period in which to familiarise themselves with the organisation.
- Keep the four economic groups, but add two 'open seats' (i.e. for any interested countries) as a fifth category. Countries filling the two open seats would need to be identified and agreed at the meeting of the F&A Committee.

The table below shows the provisional rota for the Budgetary Sub-committee membership for 2004-05 to 2007-08 (assuming no-one declines to serve).

2004-2005 (current year)	2005-2006	2006-2007	2007-2008
Group 1			
Antigua and Barbuda	Belize	Belize	Belize
Dominica	Benin	Benin	Benin
Group 2			
Korea, Republic of	Korea, Republic of	Hungary	Kenya
Hungary	Hungary	Kenya	Mexico
Group 3			
Austria	Belgium	Belgium	Belgium
Finland	Finland	Denmark	Denmark
Norway*			
Group 4			
France	Germany	Germany	Germany
Japan	Japan	Japan	Japan
USA	USA	USA	USA
Germany*			

*Open seats for Norway and Germany have been proposed. Determination of the period the open seats will be open to interested parties, will be clarified by the Budgetary Sub-committee intersessionally.

Annex N

Amendments to the Schedule Adopted at the 56th Annual Meeting

Paragraphs 11 and 12, and Tables 1, 2 and 3:

Substitute the dates ***2004/2005*** pelagic season, ***2005*** coastal season, ***2005*** season, or ***2005*** as appropriate.

Paragraph 13:

Delete the words in 13 (b) (2): '…whose traditional aboriginal subsistence and cultural needs have been recognized.'

Add a new paragraph 13 (a) (4) to read: ***13 (a) (4) For aboriginal whaling conducted under subparagraphs (b) (1), (b) (2), and (b) (3) of this paragraph, it is forbidden to strike, take or kill calves or any whale accompanied by a calf. For aboriginal whaling conducted under subparagraphs (b) (4) of this paragraph, it is forbidden to strike, take or kill suckling calves or female whales accompanied by calves.***

Delete items 13 (b) (1) (ii) and 13 (b) (2) (ii).

Add a new paragraph 13 (a) (5) to read: ***13 (a) (5) All aboriginal whaling shall be conducted under national legislation that accords with this paragraph.***

Delete the words in paragraph 13 (b) (4):

Such whaling must be conducted under formal legislation that accords with the submission of the Government of St. Vincent and The Grenadines (IWC/54/AS 8 rev. 2).

Financial Statements for the Year ended 31 August 2004

Financial Statements for the year ended 31 August 2004

Independent Auditors' Report to the Commission

We have audited the financial statements of the International Whaling Commission which comprise the accounting policies, the income and expenditure account, the analysis of expenditure, the balance sheet and the related notes 1 to 8. These financial statements have been prepared under the accounting policies set out therein. This report is made solely to the Commission. Our audit work has been undertaken so that we might state to the Commission those matters we are required to state to them in an auditors' report and for no other purpose. To the fullest extent permitted by law, we do not accept or assume responsibility to anyone other than the Commission for our audit work, for this report, or for the opinions we have formed.

Respective Responsibilities of the Secretary and Auditors
As described in the statement of the Secretary's responsibilities, the Secretary is responsible for the preparation of financial statements.

Neither statute nor the Commission has prescribed that the financial statements should give a true and fair view of the Commission's state of affairs at the end of each year within the specialised meaning of that expression in relation to financial statements. This recognised terminology signifies in accounting terms that statements are generally accepted as true and fair only if they comply in all material aspects with accepted accounting principles. These are embodied in accounting standards issued by the Accounting Standards Board. The Commission has adopted certain accounting policies which represent departures from accounting standards:

- fixed assets are not capitalised within the Commission's accounts. Instead fixed assets are charged to the income and expenditure account in the year of acquisition. Hence, the residual values of the furniture, fixtures and fittings and equipment are not reflected in the accounts;
- publications stocks are charged to the income and expenditure account in the year of acquisition and their year end valuation is not reflected in the accounts.
- provision is made for the severance pay which would be payable should the Commission cease to function.

This is permissible as the financial statements are not required to give a true and fair view.

It is our responsibility to form an independent opinion, based on our audit, on those statements and to report our opinion to you. We also report if the Commission has not kept proper accounting records or if we have not received all the information and explanations we require for our audit.

Basis of Opinion
We conducted our audit in accordance with United Kingdom Auditing Standards issued by the Auditing Practices Board. An audit includes examination, on a test basis, of evidence relevant to the amounts and disclosures in the financial statements. It also includes an assessment of the significant estimates and judgements made by the Secretary in the preparation of the financial statements, and of whether the accounting policies are appropriate to the Commission's circumstances, consistently applied and adequately disclosed.

We planned and performed our audit so as to obtain all the information and explanations which we considered necessary in order to provide us with sufficient evidence to give reasonable assurance that the financial statements are free from material misstatement whether caused by fraud or other irregularity or error. In forming our opinion, we also evaluated the overall adequacy of the presentation of information in the financial statements.

Added Emphasis
In forming our opinion we have taken account of the absence of a requirement for the financial statements to give a true and fair view as described above.

Opinion
In our opinion the financial statements have been properly prepared in accordance with the accounting policies and present a proper record of the transactions of the Commission for the year ended 31 August 2004.

D A Green & Sons, Chartered Certified Accountants, St Ives, 1 February 2005

The Secretary's Responsibilities

The financial responsibilities of the Secretary to the Commission are set out in its Rules of Procedure and Financial Regulations. Fulfilment of those responsibilities requires the Secretary to prepare financial statements for each financial year which set out the state of affairs of the Commission as at the end of the financial year and the surplus or deficit of the Commission for that period. In preparing those financial statements, the Secretary should:

- Select suitable accounting policies and then apply them consistently;
- Make judgements and estimates that are reasonable and prudent;
- Prepare the financial statements on the going concern basis unless it is inappropriate to presume that the Commission will continue in operation.

The Secretary is responsible for keeping proper accounting records which disclose with reasonable accuracy at any time the financial position of the Commission. The Secretary is also responsible for safeguarding the assets of the Commission and hence for taking reasonable steps for the prevention and detection of fraud and other irregularities.

Accounting Policies - Year ended 31 August 2004

The accounting policies adopted by the Commission in the preparation of these financial statements are as set out below. The departures from generally accepted accounting practice are considered not to be significant for the reasons stated.

Convention
These accounts are prepared under the historical cost convention (i.e. assets and liabilities are stated at cost and not re-valued).

Fixed Assets
The full cost of furniture and equipment is written off in the income and expenditure account in the year in which it is incurred. The total cost of equipment owned by the Commission is some £171,000 and its realisable value is not significant. Proposed expenditure on new items is included in budgets and raised by contributions for the year.

Publications
The full cost of printing publications is written off in the year. No account is taken of stocks which remain unsold at the balance sheet date.

Most sales occur shortly after publication and so stocks held are unlikely to result in many sales, consequently their net realisable value is not significant.

Severance Pay Provision
The Commission provides for an indemnity to members of staff in the event of their appointment being terminated on the abolition of their posts. The indemnity varies according to length of service and therefore an annual provision is made to bring the total provision up to the maximum liability. This liability is calculated after adjusting for staff assessments since they would not form part of the Commission's liability.

Interest on Overdue Contributions
Interest is included in the income and expenditure account on the accruals basis and provision is made where its recoverability is in doubt.

Leases
The costs of operating leases are charged to the income and expenditure account as they accrue.

Foreign Exchange
Transactions dominated in foreign currencies are translated into sterling at rates ruling at the date of the transactions. Monetary assets and liabilities denominated in foreign currencies at the balance sheet date are translated at the rates ruling at that date. These translation differences are dealt with in the income and expenditure account.

Retirement Benefits Scheme
The Commission operates a defined contribution retirement benefits scheme. The costs represent the amount of the Commission's contributions payable to the scheme in respect of the accounting period.

International Convention
for the
Regulation of Whaling, 1946

signed at Washington, 2 December 1946

and its

Protocol

signed at Washington, 19 November 1956

The Schedule which is attached to the Convention and under Article I forms an integral part thereof is amended regularly by the Commission. The most recent version begins on p. 143 of this volume.

International Convention for the Regulation of Whaling

Washington, 2nd December, 1946

The Governments whose duly authorised representatives have subscribed hereto,

Recognizing the interest of the nations of the world in safeguarding for future generations the great natural resources represented by the whale stocks;

Considering that the history of whaling has seen over-fishing of one area after another and of one species of whale after another to such a degree that it is essential to protect all species of whales from further over-fishing;

Recognizing that the whale stocks are susceptible of natural increases if whaling is properly regulated, and that increases in the size of whale stocks will permit increases in the number of whales which may be captured without endangering these natural resources;

Recognizing that it is in the common interest to achieve the optimum level of whale stocks as rapidly as possible without causing widespread economic and nutritional distress;

Recognizing that in the course of achieving these objectives, whaling operations should be confined to those species best able to sustain exploitation in order to give an interval for recovery to certain species of whales now depleted in numbers;

Desiring to establish a system of international regulation for the whale fisheries to ensure proper and effective conservation and development of whale stocks on the basis of the principles embodied in the provisions of the International Agreement for the Regulation of Whaling, signed in London on 8th June, 1937, and the protocols to that Agreement signed in London on 24th June, 1938, and 26th November, 1945; and

Having decided to conclude a convention to provide for the proper conservation of whale stocks and thus make possible the orderly development of the whaling industry;

Have agreed as follows:-

Article I

1. This Convention includes the Schedule attached thereto which forms an integral part thereof. All references to "Convention" shall be understood as including the said Schedule either in its present terms or as amended in accordance with the provisions of Article V.
2. This Convention applies to factory ships, land stations, and whale catchers under the jurisdiction of the Contracting Governments and to all waters in which whaling is prosecuted by such factory ships, land stations, and whale catchers.

Article II

As used in this Convention:-

1. "Factory ship" means a ship in which or on which whales are treated either wholly or in part;
2. "Land station" means a factory on the land at which whales are treated either wholly or in part;
3. "Whale catcher" means a ship used for the purpose of hunting, taking, towing, holding on to, or scouting for whales;
4. "Contracting Government" means any Government which has deposited an instrument of ratification or has given notice of adherence to this Convention.

Article III

1. The Contracting Governments agree to establish an International Whaling Commission, hereinafter referred to as the Commission, to be composed of one member from each Contracting Government. Each member shall have one vote and may be accompanied by one or more experts and advisers.
2. The Commission shall elect from its own members a Chairman and Vice-Chairman and shall determine its own Rules of Procedure. Decisions of the Commission shall be taken by a simple majority of those members voting except that a three-fourths majority of those members voting shall be required for action in pursuance of Article V. The Rules of Procedure may provide for decisions otherwise than at meetings of the Commission.
3. The Commission may appoint its own Secretary and staff.
4. The Commission may set up, from among its own members and experts or advisers, such committees as it considers desirable to perform such functions as it may authorize.
5. The expenses of each member of the Commission and of his experts and advisers shall be determined by his own Government.
6. Recognizing that specialized agencies related to the United Nations will be concerned with the conservation and development of whale fisheries and the products arising therefrom and desiring to avoid duplication of functions, the Contracting Governments will consult among themselves within two years after the coming into force of this Convention to decide whether the Commission shall be brought within the framework of a specialized agency related to the United Nations.
7. In the meantime the Government of the United Kingdom of Great Britain and Northern Ireland shall arrange, in consultation with the other Contracting Governments, to convene the first meeting of the Commission, and shall initiate the consultation referred to in paragraph 6 above.
8. Subsequent meetings of the Commission shall be convened as the Commission may determine.

Article IV

1. The Commission may either in collaboration with or through independent agencies of the Contracting Governments or other public or private agencies, establishments, or organizations, or independently

(a) encourage, recommend, or if necessary, organize studies and investigations relating to whales and whaling;
(b) collect and analyze statistical information concerning the current condition and trend of the whale stocks and the effects of whaling activities thereon;
(c) study, appraise, and disseminate information concerning methods of maintaining and increasing the populations of whale stocks.

2. The Commission shall arrange for the publication of reports of its activities, and it may publish independently or in collaboration with the International Bureau for Whaling Statistics at Sandefjord in Norway and other organizations and agencies such reports as it deems appropriate, as well as statistical, scientific, and other pertinent information relating to whales and whaling.

Article V

1. The Commission may amend from time to time the provisions of the Schedule by adopting regulations with respect to the conservation and utilization of whale resources, fixing *(a)* protected and unprotected species; *(b)* open and closed seasons; *(c)* open and closed waters, including the designation of sanctuary areas; *(d)* size limits for each species; *(e)* time, methods, and intensity of whaling (including the maximum catch of whales to be taken in any one season); *(f)* types and specifications of gear and apparatus and appliances which may be used; *(g)* methods of measurement; and *(h)* catch returns and other statistical and biological records.
2. These amendments of the Schedule *(a)* shall be such as are necessary to carry out the objectives and purposes of this Convention and to provide for the conservation, development, and optimum utilization of the whale resources; *(b)* shall be based on scientific findings; *(c)* shall not involve restrictions on the number or nationality of factory ships or land stations, nor allocate specific quotas to any factory or ship or land station or to any group of factory ships or land stations; and *(d)* shall take into consideration the interests of the consumers of whale products and the whaling industry.
3. Each of such amendments shall become effective with respect to the Contracting Governments ninety days following notification of the amendment by the Commission to each of the Contracting Governments, except that *(a)* if any Government presents to the Commission objection to any amendment prior to the expiration of this ninety-day period, the amendment shall not become effective with respect to any of the Governments for an additional ninety days; *(b)* thereupon, any other Contracting Government may present objection to the amendment at any time prior to the expiration of the additional ninety-day period, or before the expiration of thirty days from the date of receipt of the last objection received during such additional ninety-day period, whichever date shall be the later; and *(c)* thereafter, the amendment shall become effective with respect to all Contracting Governments which have not presented objection but shall not become effective with respect to any Government which has so objected until such date as the objection is withdrawn. The Commission shall notify each Contracting Government immediately upon receipt of each objection and withdrawal and each Contracting Government shall acknowledge receipt of all notifications of amendments, objections, and withdrawals.
4. No amendments shall become effective before 1st July, 1949.

Article VI

The Commission may from time to time make recommendations to any or all Contracting Governments on any matters which relate to whales or whaling and to the objectives and purposes of this Convention.

Article VII

The Contracting Government shall ensure prompt transmission to the International Bureau for Whaling Statistics at Sandefjord in Norway, or to such other body as the Commission may designate, of notifications and statistical and other information required by this Convention in such form and manner as may be prescribed by the Commission.

Article VIII

1. Notwithstanding anything contained in this Convention any Contracting Government may grant to any of its nationals a special permit authorizing that national to kill, take and treat whales for purposes of scientific research subject to such restrictions as to number and subject to such other conditions as the Contracting Government thinks fit, and the killing, taking, and treating of whales in accordance with the provisions of this Article shall be exempt from the operation of this Convention. Each Contracting Government shall report at once to the Commission all such authorizations which it has granted. Each Contracting Government may at any time revoke any such special permit which it has granted.
2. Any whales taken under these special permits shall so far as practicable be processed and the proceeds shall be dealt with in accordance with directions issued by the Government by which the permit was granted.
3. Each Contracting Government shall transmit to such body as may be designated by the Commission, in so far as practicable, and at intervals of not more than one year, scientific information available to that Government with respect to whales and whaling, including the results of research conducted pursuant to paragraph 1 of this Article and to Article IV.
4. Recognizing that continuous collection and analysis of biological data in connection with the operations of factory ships and land stations are indispensable to sound and constructive management of the whale fisheries, the Contracting Governments will take all practicable measures to obtain such data.

Article IX

1. Each Contracting Government shall take appropriate measures to ensure the application of the provisions of this Convention and the punishment of infractions against the said provisions in operations carried out by persons or by vessels under its jurisdiction.
2. No bonus or other remuneration calculated with relation to the results of their work shall be paid to the gunners and crews of whale catchers in respect of any whales the taking of which is forbidden by this Convention.
3. Prosecution for infractions against or contraventions of this Convention shall be instituted by the Government having jurisdiction over the offence.
4. Each Contracting Government shall transmit to the Commission full details of each infraction of the provisions of this Convention by persons or vessels under the jurisdiction of that Government as reported by its

inspectors. This information shall include a statement of measures taken for dealing with the infraction and of penalties imposed.

Article X

1. This Convention shall be ratified and the instruments of ratifications shall be deposited with the Government of the United States of America.
2. Any Government which has not signed this Convention may adhere thereto after it enters into force by a notification in writing to the Government of the United States of America.
3. The Government of the United States of America shall inform all other signatory Governments and all adhering Governments of all ratifications deposited and adherences received.
4. This Convention shall, when instruments of ratification have been deposited by at least six signatory Governments, which shall include the Governments of the Netherlands, Norway, the Union of Soviet Socialist Republics, the United Kingdom of Great Britain and Northern Ireland, and the United States of America, enter into force with respect to those Governments and shall enter into force with respect to each Government which subsequently ratifies or adheres on the date of the deposit of its instrument of ratification or the receipt of its notification of adherence.
5. The provisions of the Schedule shall not apply prior to 1st July, 1948. Amendments to the Schedule adopted pursuant to Article V shall not apply prior to 1st July, 1949.

Article XI

Any Contracting Government may withdraw from this Convention on 30th June, of any year by giving notice on or before 1st January, of the same year to the depository Government, which upon receipt of such a notice shall at once communicate it to the other Contracting Governments. Any other Contracting Government may, in like manner, within one month of the receipt of a copy of such a notice from the depository Government give notice of withdrawal, so that the Convention shall cease to be in force on 30th June, of the same year with respect to the Government giving such notice of withdrawal.

The Convention shall bear the date on which it is opened for signature and shall remain open for signature for a period of fourteen days thereafter.

In witness whereof the undersigned, being duly authorized, have signed this Convention.

Done in Washington this second day of December, 1946, in the English language, the original of which shall be deposited in the archives of the Government of the United States of America. The Government of the United States of America shall transmit certified copies thereof to all the other signatory and adhering Governments.

Protocol

to the International Convention for the Regulation of Whaling, Signed at Washington Under Date of December 2, 1946

The Contracting Governments to the International Convention for the Regulation of Whaling signed at Washington under date of 2nd December, 1946 which Convention is hereinafter referred to as the 1946 Whaling Convention, desiring to extend the application of that Convention to helicopters and other aircraft and to include provisions on methods of inspection among those Schedule provisions which may be amended by the Commission, agree as follows:

Article I

Subparagraph 3 of the Article II of the 1946 Whaling Convention shall be amended to read as follows:

"3. 'whale catcher' means a helicopter, or other aircraft, or a ship, used for the purpose of hunting, taking, killing, towing, holding on to, or scouting for whales."

Article II

Paragraph 1 of Article V of the 1946 Whaling Convention shall be amended by deleting the word "and" preceding clause (h), substituting a semicolon for the period at the end of the paragraph, and adding the following language: "and (i) methods of inspection".

Article III

1. This Protocol shall be open for signature and ratification or for adherence on behalf of any Contracting Government to the 1946 Whaling Convention.
2. This Protocol shall enter into force on the date upon which instruments of ratification have been deposited with, or written notifications of adherence have been received by, the Government of the United States of America on behalf of all the Contracting Governments to the 1946 Whaling Convention.
3. The Government of the United States of America shall inform all Governments signatory or adhering to the 1946 Whaling Convention of all ratifications deposited and adherences received.
4. This Protocol shall bear the date on which it is opened for signature and shall remain open for signature for a period of fourteen days thereafter, following which period it shall be open for adherence.

IN WITNESS WHEREOF the undersigned, being duly authorized, have signed this Protocol.

DONE in Washington this nineteenth day of November, 1956, in the English Language, the original of which shall be deposited in the archives of the Government of the United States of America. The Government of the United States of America shall transmit certified copies thereof to all Governments signatory or adhering to the 1946 Whaling Convention.

International Convention

for the

Regulation of Whaling, 1946

Schedule

As amended by the Commission at the 56th Annual Meeting
Sorrento, Italy, 19-22 July 2004

International Convention for the Regulation of Whaling, 1946

Schedule

EXPLANATORY NOTES

The Schedule printed on the following pages contains the amendments made by the Commission at its 56th Annual Meeting in July 2004. It also contains an additional editorial footnote to paragraph 10(*e*). The amendments, which are shown in ***italic bold*** type, came into effect on 28 October 2004.

In Tables 1, 2 and 3 unclassified stocks are indicated by a dash. Other positions in the Tables have been filled with a dot to aid legibility.

Numbered footnotes are integral parts of the Schedule formally adopted by the Commission. Other footnotes are editorial.

The Commission was informed in June 1992 by the ambassador in London that the membership of the Union of Soviet Socialist Republics in the International Convention for the Regulation of Whaling from 1948 is continued by the Russian Federation.

The Commission recorded at its 39th (1987) meeting the fact that references to names of native inhabitants in Schedule paragraph 13(*b*)(4) would be for geographical purposes alone, so as not to be in contravention of Article V.2(*c*) of the Convention (*Rep. int. Whal. Commn* 38:21).

I. INTERPRETATION

1. The following expressions have the meanings respectively assigned to them, that is to say:

A. Baleen whales

"baleen whale" means any whale which has baleen or whale bone in the mouth, i.e. any whale other than a toothed whale.

"blue whale" (*Balaenoptera musculus*) means any whale known as blue whale, Sibbald's rorqual, or sulphur bottom, and including pygmy blue whale.

"bowhead whale" (*Balaena mysticetus*) means any whale known as bowhead, Arctic right whale, great polar whale, Greenland right whale, Greenland whale.

"Bryde's whale" (*Balaenoptera edeni*, *B. brydei*) means any whale known as Bryde's whale.

"fin whale" (*Balaenoptera physalus*) means any whale known as common finback, common rorqual, fin whale, herring whale, or true fin whale.

"gray whale" (Eschrichtius robustus) means any whale known as gray whale, California gray, devil fish, hard head, mussel digger, gray back, or rip sack.

"humpback whale" (*Megaptera novaeangliae*) means any whale known as bunch, humpback, humpback whale, humpbacked whale, hump whale or hunchbacked whale.

"minke whale" (*Balaenoptera acutorostrata*, *B. bonaerensis*) means any whale known as lesser rorqual, little piked whale, minke whale, pike-headed whale or sharp headed finner.

"pygmy right whale" (*Caperea marginata*) means any whale known as southern pygmy right whale or pygmy right whale.

"right whale" (*Eubalaena glacialis*, *E. australis*) means any whale known as Atlantic right whale, Arctic right whale, Biscayan right whale, Nordkaper, North Atlantic right whale, North Cape whale, Pacific right whale, or southern right whale.

"sei whale" (*Balaenoptera borealis*) means any whale known as sei whale, Rudolphi's rorqual, pollack whale, or coalfish whale.

B. Toothed whales

"toothed whale" means any whale which has teeth in the jaws.

"beaked whale" means any whale belonging to the genus Mesoplodon, or any whale known as Cuvier's beaked whale (*Ziphius cavirostris*), or Shepherd's beaked whale (*Tasmacetus shepherdi*).

"bottlenose whale" means any whale known as Baird's beaked whale (*Berardius bairdii*), Arnoux's whale (*Berardius arnuxii*), southern bottlenose whale (*Hyperoodon planifrons*), or northern bottlenose whale (*Hyperoodon ampullatus*).

"killer whale" (*Orcinus orca*) means any whale known as killer whale or orca.

"pilot whale" means any whale known as long-finned pilot whale (*Globicephala melaena*) or short-finned pilot whale (*G. macrorhynchus*).

"sperm whale" (*Physeter macrocephalus*) means any whale known as sperm whale, spermacet whale, cachalot or pot whale.

C. General

"strike" means to penetrate with a weapon used for whaling.

"land" means to retrieve to a factory ship, land station, or other place where a whale can be treated.

"take" means to flag, buoy or make fast to a whale catcher.

"lose" means to either strike or take but not to land.

"dauhval" means any unclaimed dead whale found floating.

"lactating whale" means (a) with respect to baleen whales - a female which has any milk present in a mammary gland, (b) with respect to sperm whales - a female which has milk present in a mammary gland the maximum thickness (depth) of which is 10cm or more. This measurement shall be at the mid ventral point of the mammary gland perpendicular to the body axis, and shall be logged to the nearest centimetre; that is to say, any gland between 9.5cm and 10.5cm shall be logged as 10cm. The measurement of any gland which falls on an exact 0.5 centimetre shall be logged at the next 0.5 centimetre, e.g. 10.5cm shall be logged as 11.0cm. However, notwithstanding these criteria, a whale shall not be considered a lactating whale if scientific (histological or other biological) evidence is presented to the appropriate national authority establishing that the whale could not at that point in its physical cycle have had a calf dependent on it for milk.

"small-type whaling" means catching operations using powered vessels with mounted harpoon guns hunting exclusively for minke, bottlenose, beaked, pilot or killer whales.

II. SEASONS

Factory Ship Operations

2. (*a*) It is forbidden to use a factory ship or whale catcher attached thereto for the purpose of taking or treating baleen whales except minke whales, in any waters south of 40° South Latitude except during the period from 12th December to 7th April following, both days inclusive.

(*b*) It is forbidden to use a factory ship or whale catcher attached thereto for the purpose of taking or treating sperm or minke whales, except as permitted by the Contracting Governments in accordance with sub-paragraphs (c) and (d) of this paragraph, and paragraph 5.

(*c*) Each Contracting Government shall declare for all factory ships and whale catchers attached thereto under its jurisdiction, an open season or seasons not to exceed eight months out of any period of twelve months during which the taking or killing of sperm whales by whale catchers may be permitted; provided that a separate open season may be declared for each factory ship and the whale catchers attached thereto.

(*d*) Each Contracting Government shall declare for all factory ships and whale catchers attached thereto under its jurisdiction one continuous open season not to exceed six months out of any period of twelve months during which the taking or killing of minke whales by the whale catchers may be permitted provided that:

(1) a separate open season may be declared for each factory ship and the whale catchers attached thereto;

(2) the open season need not necessarily include the whole or any part of the period declared for other baleen whales pursuant to sub-paragraph (*a*) of this paragraph.

3. It is forbidden to use a factory ship which has been used during a season in any waters south of 40° South Latitude for the purpose of treating baleen whales, except minke whales, in any other area except the North Pacific Ocean and its dependent waters north of the Equator for the same purpose within a period of one year from the termination of that season; provided that catch limits in the North Pacific Ocean and dependent waters are established as provided in paragraphs 12 and 16 of this Schedule and provided that this paragraph shall not apply to a ship which has been used during the season solely for freezing or salting the meat and entrails of whales intended for human food or feeding animals.

Land Station Operations

4. (*a*) It is forbidden to use a whale catcher attached to a land station for the purpose of killing or attempting to kill baleen and sperm whales except as permitted by the Contracting Government in accordance with sub-paragraphs (*b*), (*c*) and (*d*) of this paragraph.

(*b*) Each Contracting Government shall declare for all land stations under its jurisdiction, and whale catchers attached to such land stations, one open season during which the taking or killing of baleen whales, except minke whales, by the whale catchers shall be permitted. Such open season shall be for a period of not more than six consecutive months in any period of twelve months and shall apply to all land stations under the jurisdiction of the Contracting Government: provided that a separate open season may be declared for any land station used for the taking or treating of baleen whales, except minke whales, which is more than 1,000 miles from the nearest land station used for the taking or treating of baleen whales, except minke whales, under the jurisdiction of the same Contracting Government.

(*c*) Each Contracting Government shall declare for all land stations under its jurisdiction and for whale catchers attached to such land stations, one open season not to exceed eight continuous months in any one period of twelve months, during which the taking or killing of sperm whales by the whale catchers shall be permitted, provided that a separate open season may be declared for any land station used for the taking or treating of sperm whales which is more than 1,000 miles from the nearest land station used for the taking or treating of sperm whales under the jurisdiction of the same Contracting Government.

(*d*) Each Contracting Government shall declare for all land stations under its jurisdiction and for whale catchers attached to such land stations one open season not to exceed six continuous months in any period of twelve months during which the taking or killing of minke whales by the whale catchers shall be permitted (such period not being necessarily concurrent with the period declared for other baleen whales, as provided for in sub-paragraph (b) of this paragraph); provided that a separate open season may be declared for any land station used for the taking or treating of minke whales which is more than 1,000 miles from the nearest land station used for the taking or treating of minke whales under the jurisdiction of the same Contracting Government.

Except that a separate open season may be declared for any land station used for the taking or treating of minke whales which is located in an area having oceanographic conditions clearly distinguishable from those of the area in which are located the other land stations used for the taking or treating of minke whales under the jurisdiction of the same Contracting Government; but the declaration of a separate open season by virtue of the provisions of this sub-paragraph shall not cause thereby the period of time covering the open seasons declared by the same Contracting Government to exceed nine continuous months of any twelve months.

(*e*) The prohibitions contained in this paragraph shall apply to all land stations as defined in Article II of the Whaling Convention of 1946.

Other Operations

5. Each Contracting Government shall declare for all whale catchers under its jurisdiction not operating in conjunction with a factory ship or land station one continuous open season not to exceed six months out of any period of twelve months during which the taking or killing of minke whales by such whale catchers may be permitted. Notwithstanding this paragraph one continuous open season not to exceed nine months may be implemented so far as Greenland is concerned.

III. CAPTURE

6. The killing for commercial purposes of whales, except minke whales using the cold grenade harpoon shall be forbidden from the beginning of the 1980/81 pelagic and 1981 coastal seasons. The killing for commercial purposes of minke whales using the cold grenade harpoon shall be forbidden from the beginning of the 1982/83 pelagic and the 1983 coastal seasons.*

7. (*a*) In accordance with Article V(1)(c) of the Convention, commercial whaling, whether by pelagic operations or from land stations, is prohibited in a region designated as the Indian Ocean Sanctuary. This comprises the waters of the Northern Hemisphere from the coast of Africa to 100°E, including the Red and Arabian Seas and the Gulf of Oman; and the waters of the Southern Hemisphere in the sector from 20°E to 130°E, with the Southern boundary set at 55°S. This prohibition applies irrespective of such catch limits for baleen or toothed whales as may from time to time be determined by the Commission. This prohibition shall be reviewed by the Commission at its Annual Meeting in 2002.☼

(*b*) In accordance with Article V(1)(c) of the Convention, commercial whaling, whether by pelagic operations or from land stations, is prohibited in a region designated as the Southern Ocean Sanctuary. This Sanctuary comprises the waters of the Southern Hemisphere southwards of the following line: starting from 40 degrees S, 50 degrees W; thence due east to 20 degrees E; thence due south to 55 degrees S; thence due east to 130 degrees E; thence due north to 40 degrees S; thence due east to 130 degrees W; thence due south to 60 degrees S; thence due east to 50 degrees W; thence due north to the point of beginning. This prohibition applies irrespective of the conservation status of baleen and toothed whale stocks in this Sanctuary, as may from time to time be determined by the Commission. However, this prohibition shall be reviewed ten years after its initial adoption and at succeeding ten year intervals, and could be revised at such times by the Commission. Nothing in this sub-paragraph is intended to prejudice the special legal and political status of Antarctica.**+

Area Limits for Factory Ships

8. It is forbidden to use a factory ship or whale catcher attached thereto, for the purpose of taking or treating baleen whales, except minke whales, in any of the following areas:
   (*a*) in the waters north of 66°N, except that from 150°E eastwards as far as 140°W, the taking or killing of baleen whales by a factory ship or whale catcher shall be permitted between 66°N and 72°N;
   (*b*) in the Atlantic Ocean and its dependent waters north of 40°S;
   (*c*) in the Pacific Ocean and its dependent waters east of 150°W between 40°S and 35°N;
   (*d*) in the Pacific Ocean and its dependent waters west of 150°W between 40°S and 20°N; and
   (*e*) in the Indian Ocean and its dependent waters north of 40°S.

Classification of Areas and Divisions

9. (*a*) *Classification of Areas*
   Areas relating to Southern Hemisphere baleen whales except Bryde's whales are those waters between the ice-edge and the Equator and between the meridians of longitude listed in Table 1.
   (*b*) *Classification of Divisions*
   Divisions relating to Southern Hemisphere sperm whales are those waters between the ice-edge and the Equator and between the meridians of longitude listed in Table 3.
   (*c*) *Geographical boundaries in the North Atlantic*
   The geographical boundaries for the fin, minke and sei whale stocks in the North Atlantic are:

FIN WHALE STOCKS

NOVA SCOTIA
South and West of a line through:
47°N 54°W, 46°N 54°30'W,
46°N 42°W, 20°N 42°W.

NEWFOUNDLAND-LABRADOR
West of a line through:
75°N 73°30'W, 69°N 59°W, 61°N 59°W
52°20'N 42°W, 46°N 42°W and
North of a line through:
46°N 42°W, 46°N 54°30'W, 47°N 54°W.

---

*The Governments of Brazil, Iceland, Japan, Norway and the Union of Soviet Socialist Republics lodged objections to the second sentence of paragraph 6 within the prescribed period. For all other Contracting Governments this sentence came into force on 8 March 1982. Norway withdrew its objection on 9 July 1985 and Brazil on 8 January 1992. Iceland withdrew from the Convention with effect from 30 June 1992. The objections of Japan and the Russian Federation not having been withdrawn, this sentence is not binding upon these governments.

☼At its 54th Annual Meeting in 2002, the Commission agreed to continue this prohibition but did not discuss whether or not it should set a time when it should be reviewed again.

** The Government of Japan lodged an objection within the prescribed period to paragraph 7(b) to the extent that it applies to the Antarctic minke whale stocks. The Government of the Russian Federation also lodged an objection to paragraph 7(b) within the prescribed period but withdrew it on 26 October 1994. For all Contracting Governments except Japan paragraph 7(b) came into force on 6 December 1994.

+Paragraph 7(*b*) contains a provision for review of the Southern Ocean Sanctuary "ten years after its initial adoption". Paragraph 7(*b*) was adopted at the 46th (1994) Annual Meeting. Therefore, the first review is due in 2004.

WEST GREENLAND
East of a line through:
75°N 73°30'W, 69°N 59°W,
61°N 59°W, 52°20'N 42°W,
and West of a line through
52°20'N 42°W, 59°N 42°W,
59°N 44°W, Kap Farvel.

EAST GREENLAND-ICELAND
East of a line through:
Kap Farvel (South Greenland),
59°N 44°W, 59°N 42°W, 20°N 42°W
and West of a line through:
20°N 18°W, 60°N 18°W, 68°N 3°E,
74°N 3°E, and South of 74°N.

NORTH NORWAY
North and East of a line through:
74°N 22°W, 74°N 3°E, 68°N 3°E,
67°N 0°, 67°N 14°E.

52°20'N 42°W, and
West of a line through:
52°20'N 42°W, 59°N 42°W,
59°N 44°W, Kap Farvel.

NORTHEASTERN
East of a line through:
20°N 18°W, 60°N 18°W, 68°N 3°E, 74°N 3°E,
and North of a line through:
74°N 3°E, 74°N 22°W.

SEI WHALE STOCKS

NOVA SCOTIA
South and West of a line through:
47°N 54°W, 46°N 54°30'W, 46°N 42°W,
20°N 42°W.

ICELAND-DENMARK STRAIT
East of a line through:
Kap Farvel (South Greenland),
59°N 44°W, 59°N 42°W, 20°N 42°W,
and West of a line through:
20°N 18°W, 60°N 18°W, 68°N 3°E,
74°N 3°E, and South of 74°N.

EASTERN
East of a line through:
20°N 18°W, 60°N 18°W, 68°N 3°E, 74°N 3°E,
and North of a line through:
74°N 3°E, 74°N 22°W.

(*d*) *Geographical boundaries in the North Pacific*

The geographical boundaries for the sperm, Bryde's and minke whale stocks in the North Pacific are:

SPERM WHALE STOCKS

WESTERN DIVISION
West of a line from the ice-edge south along the 180° meridian of longitude to 180°, 50°N, then east along the 50°N parallel of latitude to 160°W, 50°N, then south along the 160°W meridian of longitude to 160°W, 40°N, then east along the 40°N parallel of latitude to 150°W, 40°N, then south along the 150°W meridian of longitude to the Equator.

EASTERN DIVISION
East of the line described above.

BRYDE'S WHALE STOCKS

EAST CHINA SEA
West of the Ryukyu Island chain.

EASTERN
East of 160°W (excluding the Peruvian stock area).

WESTERN
West of 160°W (excluding the East China Sea stock area).

MINKE WHALE STOCKS

SEA OF JAPAN-YELLOW SEA- EAST CHINA SEA
West of a line through the Philippine Islands, Taiwan, Ryukyu Islands, Kyushu, Honshu, Hokkaido and Sakhalin Island, north of the Equator.

OKHOTSK SEA-WEST PACIFIC
East of the Sea of Japan-Yellow Sea- East China Sea stock and west of 180°, north of the Equator.

REMAINDER
East of the Okhotsk Sea-West Pacific stock, north of the Equator.

(*e*) *Geographical boundaries for Bryde's whale stocks in the Southern Hemisphere*

SOUTHERN INDIAN OCEAN
20°E to 130°E,
South of the Equator.

SOLOMON ISLANDS
150°E to 170°E,
20°S to the Equator.

PERUVIAN
110°W to the South American coast,
10°S to 10°N.

EASTERN SOUTH PACIFIC
150°W to 70°W,
South of the Equator (excluding the Peruvian stock area).

WESTERN SOUTH PACIFIC
130°E to 150°W,
South of the Equator (excluding the Solomon Islands stock area).

SOUTH ATLANTIC
70°W to 20°E,
South of the Equator (excluding the South African inshore stock area).

SOUTH AFRICAN INSHORE
South African coast west of 27°E and out to the 200 metre isobath.

[1] Available to be taken by aborigines or a Contracting Government on behalf of aborigines pursuant to paragraph 13*(b)*2. [2] Available to be taken by aborigines pursuant to paragraph 13*(b)*3. Catch limit for each of the years 2003, 2004, 2005, 2006 and 2007. + The catch limits of zero introduced into Table 1 as editorial amendments as a result of the coming into effect of paragraph 10*(e)* are not binding upon the governments of the countries which lodged and have not withdrawn objections to the said paragraph. *The Government of Norway presented objection to the classification of the Northeastern Atlantic stock of minke whales as a Protection Stock within the prescribed period. This classification came into force on 30 January 1986 but is not binding on the Government of Norway.

Classification of Stocks

10. All stocks of whales shall be classified in one of three categories according to the advice of the Scientific Committee as follows:

(*a*) A Sustained Management Stock (SMS) is a stock which is not more than 10 per cent of Maximum Sustainable Yield (hereinafter referred to as MSY) stock level below MSY stock level, and not more than 20 per cent above that level; MSY being determined on the basis of the number of whales.

When a stock has remained at a stable level for a considerable period under a regime of approximately constant catches, it shall be classified as a Sustained Management Stock in the absence of any positive evidence that it should be otherwise classified.

Commercial whaling shall be permitted on Sustained Management Stocks according to the advice of the Scientific Committee. These stocks are listed in Tables 1, 2 and 3 of this Schedule.

For stocks at or above the MSY stock level, the permitted catch shall not exceed 90 per cent of the MSY. For stocks between the MSY stock level and 10 per cent below that level, the permitted catch shall not exceed the number of whales obtained by taking 90 per cent of the MSY and reducing that number by 10 per cent for every 1 per cent by which the stock falls short of the MSY stock level.

(*b*) An Initial Management Stock (IMS) is a stock more than 20 per cent of MSY stock level above MSY stock level. Commercial whaling shall be permitted on Initial Management Stocks according to the advice of the Scientific Committee as to measures necessary to bring the stocks to the MSY stock level and then optimum level in an efficient manner and without risk of reducing them below this level. The permitted catch for such stocks will not be more than 90 per cent of MSY as far as this is known, or, where it will be more appropriate, catching effort shall be limited to that which will take 90 per cent of MSY in a stock at MSY stock level.

In the absence of any positive evidence that a continuing higher percentage will not reduce the stock below the MSY stock level no more than 5 per cent of the estimated initial exploitable stock shall be taken in any one year. Exploitation should not commence until an estimate of stock size has been obtained which is satisfactory in the view of the Scientific Committee. Stocks classified as Initial Management Stock are listed in Tables 1, 2 and 3 of this Schedule.

(*c*) A Protection Stock (PS) is a stock which is below 10 per cent of MSY stock level below MSY stock level.

There shall be no commercial whaling on Protection Stocks. Stocks so classified are listed in Tables 1, 2 and 3 of this Schedule.

(*d*) Notwithstanding the other provisions of paragraph 10 there shall be a moratorium on the taking, killing or treating of whales, except minke whales, by factory ships or whale catchers attached to factory ships. This moratorium applies to sperm whales, killer whales and baleen whales, except minke whales.

(*e*) Notwithstanding the other provisions of paragraph 10, catch limits for the killing for commercial purposes of whales from all stocks for the 1986 coastal and the 1985/86 pelagic seasons and thereafter shall be zero. This provision will be kept under review, based upon the best scientific advice, and by 1990 at the latest the Commission will undertake a comprehensive assessment of the effects of this decision on whale stocks and consider modification of this provision and the establishment of other catch limits.* • #

NORTHERN INDIAN OCEAN-***2005*** season	-	0

[+] The catch limits of zero introduced in Table 2 as editorial amendments as a result of the coming into effect of paragraph 10*(e)* are not binding upon the governments of the countries which lodged and have not withdrawn objections to the said paragraph.

*The Governments of Japan, Norway, Peru and the Union of Soviet Socialist Republics lodged objection to paragraph 10(e) within the prescribed period. For all other Contracting Governments this paragraph came into force on 3 February 1983. Peru withdrew its objection on 22 July 1983. The Government of Japan withdrew its objections with effect from 1 May 1987 with respect to commercial pelagic whaling; from 1 October 1987 with respect to commercial coastal whaling for minke and Bryde's whales; and from 1 April 1988 with respect to commercial coastal sperm whaling. The objections of Norway and the Russian Federation not having been withdrawn, the paragraph is not binding upon these Governments.

•Iceland's instrument of adherence to the International Convention for the Regulation of Whaling and the Protocol to the Convention deposited on 10 October 2002 states that Iceland 'adheres to the aforesaid Convention and Protocol with a reservation with respect to paragraph 10(e) of the Schedule attached to the Convention'. The instrument further states the following:

'Notwithstanding this, the Government of Iceland will not authorise whaling for commercial purposes by Icelandic vessels before 2006 and, thereafter, will not authorise such whaling while progress is being made in negotiations within the IWC on the RMS. This does not apply, however, in case of the so-called moratorium on whaling for commercial purposes, contained in paragraph 10(e) of the Schedule not being lifted within a reasonable time after the completion of the RMS. Under no circumstances will whaling for commercial purposes be authorised without a sound scientific basis and an effective management and enforcement scheme.'

[#]The Governments of Argentina, Australia, Brazil, Chile, Finland, France, Germany, Italy, Mexico, Monaco, the Netherlands, New Zealand, Peru, San Marino, Spain, Sweden, UK and the USA have lodged objections to Iceland's reservation to paragraph 10(e).

[1] No whales may be taken from this stock until catch limits including any limitations on size and sex are established by the Commission.

[+] The catch limits of zero introduced in Table 3 as editorial amendments as a result of the coming into effect of paragraph 10*(e)* are not binding upon the governments of the countries which lodged and have not withdrawn objections to the said paragraph.

Baleen Whale Catch Limits

11. The number of baleen whales taken in the Southern Hemisphere in the ***2004/2005*** pelagic season and the 2005 coastal season shall not exceed the limits shown in Tables 1 and 2.

12. The number of baleen whales taken in the North Pacific Ocean and dependent waters in ***2005*** and in the North Atlantic Ocean in ***2005*** shall not exceed the limits shown in Tables 1 and 2.

13. (*a*) Notwithstanding the provisions of paragraph 10, catch limits for aboriginal subsistence whaling to satisfy aboriginal subsistence need for the 1984 whaling season and each whaling season thereafter shall be established in accordance with the following principles:

(1) For stocks at or above MSY level, aboriginal subsistence catches shall be permitted so long as total removals do not exceed 90 per cent of MSY.

(2) For stocks below the MSY level but above a certain minimum level, aboriginal subsistence catches shall be permitted so long as they are set at levels which will allow whale stocks to move to the MSY level.[1]

(3) The above provisions will be kept under review, based upon the best scientific advice, and by 1990 at the latest the Commission will undertake a comprehensive assessment of the effects of these provisions on whale stocks and consider modification.

(4) For aboriginal whaling conducted under sub-paragraphs (b)(1), (b)(2), and (b)(3) of this paragraph, it is forbidden to strike, take or kill calves or any whale accompanied by a calf. For aboriginal whaling conducted under subparagraphs (b)(4) of this paragraph, it is forbidden to strike, take or kill suckling calves or female whales accompanied by calves.

(5) All aboriginal whaling shall be conducted under national legislation that accords with this paragraph.

(*b*) Catch limits for aboriginal subsistence whaling are as follows:

(1) The taking of bowhead whales from the Bering-Chukchi-Beaufort Seas stock by aborigines is permitted, but only when the meat and products of such whales are to be used exclusively for local consumption by the aborigines and further provided that:

(i) For the years 2003, 2004, 2005, 2006 and 2007, the number of bowhead whales landed shall not exceed 280. For each of these years the number of bowhead whales struck shall not exceed 67, except that any unused portion of a strike quota from any year (including 15 unused strikes from the 1998 – 2002 quota) shall be carried forward and added to the strike quotas of any subsequent years, provided that no more than 15 strikes shall be added to the strike quota for any one year. ***[ ]***

(ii) This provision shall be reviewed annually by the Commission in light of the advice of the Scientific Committee.

(iii) The findings and recommendations of the Scientific Committee's in-depth assessment

[1]The Commission, on advice of the Scientific Committee, shall establish as far as possible (a) a minimum stock level for each stock below which whales shall not be taken, and (b) a rate of increase towards the MSY level for each stock. The Scientific Committee shall advise on a minimum stock level and on a range of rates of increase towards the MSY level under different catch regimes.

for 2004 shall be binding on the parties involved and they shall modify the hunt accordingly.

(2) The taking of gray whales from the Eastern stock in the North Pacific is permitted, but only by aborigines or a Contracting Government on behalf of aborigines, and then only when the meat and products of such whales are to be used exclusively for local consumption by the aborigines. ***[ ]***

(i) For the years 2003, 2004, 2005, 2006 and 2007, the number of gray whales taken in accordance with this sub-paragraph shall not exceed 620, provided that the number of gray whales taken in any one of the years 2003, 2004, 2005, 2006 and 2007 shall not exceed 140. ***[ ]***

(ii) This provision shall be reviewed annually by the Commission in light of the advice of the Scientific Committee.

(3) The taking by aborigines of minke whales from the West Greenland and Central stocks and fin whales from the West Greenland stock is permitted and then only when the meat and products are to be used exclusively for local consumption.

(i) The number of fin whales from the West Greenland stock taken in accordance with this sub-paragraph shall not exceed the limits shown in Table 1.

(ii) The number of minke whales from the Central stock taken in accordance with this sub-paragraph shall not exceed 12 in each of the years 2003, 2004, 2005, 2006 and 2007, except that any unused portion of the quota for each year shall be carried forward from that year and added to the quota of any subsequent years, provided that no more than 3 shall be added to the quota for any one year.

(iii) The number of minke whales struck from the West Greenland stock shall not exceed 175 in each of the years 2003, 2004, 2005, 2006 and 2007, except that any unused portion of the strike quota for each year shall be carried forward from that year and added to the strike quota of any subsequent years, provided that no more than 15 strikes shall be added to the strike quota for any one year. This provision will be reviewed if new scientific data become available within the 5 year period and if necessary amended on the basis of the advice of the Scientific Committee.

(4) For the seasons 2003-2007 the number of humpback whales to be taken by the Bequians of St. Vincent and The Grenadines shall not exceed 20. The meat and products of such whales are to be used exclusively for local consumption in St. Vincent and The Grenadines. ***[ ]*** The quota for the seasons 2006 and 2007 shall only become operative after the Commission has received advice from the Scientific Committee that the take of 4 humpback whales for each season is unlikely to endanger the stock.

14. It is forbidden to take or kill suckling calves or female whales accompanied by calves.

Baleen Whale Size Limits

15. (*a*) It is forbidden to take or kill any sei or Bryde's whales below 40 feet (12.2 metres) in length except that sei and Bryde's whales of not less than 35 feet (10.7 metres) may be taken for delivery to land stations, provided that the meat of such whales is to be used for local consumption as human or animal food.

(*b*) It is forbidden to take or kill any fin whales below 57 feet (17.4 metres) in length in the Southern Hemisphere, and it is forbidden to take or kill fin whales below 55 feet (16.8 metres) in the Northern Hemisphere; except that fin whales of not less than 55 feet (16.8 metres) may be taken in the Southern Hemisphere for delivery to land stations and fin whales of not less than 50 feet (15.2 metres) may be taken in the Northern Hemisphere for delivery to land stations, provided that, in each case the meat of such whales is to be used for local consumption as human or animal food.

Sperm Whale Catch Limits

16. Catch limits for sperm whales of both sexes shall be set at zero in the Southern Hemisphere for the 1981/82 pelagic season and 1982 coastal seasons and following seasons, and at zero in the Northern Hemisphere for the 1982 and following coastal seasons; except that the catch limits for the 1982 coastal season and following seasons in the Western Division of the North Pacific shall remain undetermined and subject to decision by the Commission following special or annual meetings of the Scientific Committee. These limits shall remain in force until such time as the Commission, on the basis of the scientific information which will be reviewed annually, decides otherwise in accordance with the procedures followed at that time by the Commission.

17. It is forbidden to take or kill suckling calves or female whales accompanied by calves.

Sperm Whale Size Limits

18. (*a*) It is forbidden to take or kill any sperm whales below 30 feet (9.2 metres) in length except in the North Atlantic Ocean where it is forbidden to take or kill any sperm whales below 35 feet (10.7 metres).

(*b*) It is forbidden to take or kill any sperm whale over 45 feet (13.7 metres) in length in the Southern Hemisphere north of 40° South Latitude during the months of October to January inclusive.

(*c*) It is forbidden to take or kill any sperm whale over 45 feet (13.7 metres) in length in the North Pacific Ocean and dependent water south of 40° North Latitude during the months of March to June inclusive.

IV. TREATMENT

19. (*a*) It is forbidden to use a factory ship or a land station for the purpose of treating any whales which are

classified as Protection Stocks in paragraph 10 or are taken in contravention of paragraphs 2, 3, 4, 5, 6, 7, 8, 11, 12, 14, 16 and 17 of this Schedule, whether or not taken by whale catchers under the jurisdiction of a Contracting Government.

(*b*) All other whales taken, except minke whales, shall be delivered to the factory ship or land station and all parts of such whales shall be processed by boiling or otherwise, except the internal organs, whale bone and flippers of all whales, the meat of sperm whales and parts of whales intended for human food or feeding animals. A Contracting Government may in less developed regions exceptionally permit treating of whales without use of land stations, provided that such whales are fully utilised in accordance with this paragraph.

(*c*) Complete treatment of the carcases of "dauhval" and of whales used as fenders will not be required in cases where the meat or bone of such whales is in bad condition.

20. (*a*) The taking of whales for treatment by a factory ship shall be so regulated or restricted by the master or person in charge of the factory ship that no whale carcase (except of a whale used as a fender, which shall be processed as soon as is reasonably practicable) shall remain in the sea for a longer period than thirty-three hours from the time of killing to the time when it is hauled up for treatment.

(*b*) Whales taken by all whale catchers, whether for factory ships or land stations, shall be clearly marked so as to identify the catcher and to indicate the order of catching.

V. SUPERVISION AND CONTROL

21. (*a*) There shall be maintained on each factory ship at least two inspectors of whaling for the purpose of maintaining twenty-four hour inspection provided that at least one such inspector shall be maintained on each catcher functioning as a factory ship. These inspectors shall be appointed and paid by the Government having jurisdiction over the factory ship; provided that inspectors need not be appointed to ships which, apart from the storage of products, are used during the season solely for freezing or salting the meat and entrails of whales intended for human food or feeding animals.

(*b*) Adequate inspection shall be maintained at each land station. The inspectors serving at each land station shall be appointed and paid by the Government having jurisdiction over the land station.

(*c*) There shall be received such observers as the member countries may arrange to place on factory ships and land stations or groups of land stations of other member countries. The observers shall be appointed by the Commission acting through its Secretary and paid by the Government nominating them.

22. Gunners and crews of factory ships, land stations, and whale catchers, shall be engaged on such terms that their remuneration shall depend to a considerable extent upon such factors as the species, size and yield of whales and not merely upon the number of the whales taken. No bonus or other remuneration shall be paid to the gunners or crews of whale catchers in respect of the taking of lactating whales.

23. Whales must be measured when at rest on deck or platform after the hauling out wire and grasping device have been released, by means of a tape-measure made of a non-stretching material. The zero end of the tape-measure shall be attached to a spike or stable device to be positioned on the deck or platform abreast of one end of the whale. Alternatively the spike may be stuck into the tail fluke abreast of the apex of the notch. The tape-measure shall be held taut in a straight line parallel to the deck and the whale's body, and other than in exceptional circumstances along the whale's back, and read abreast of the other end of the whale. The ends of the whale for measurement purposes shall be the tip of the upper jaw, or in sperm whales the most forward part of the head, and the apex of the notch between the tail flukes.

Measurements shall be logged to the nearest foot or 0.1 metre. That is to say, any whale between 75 feet 6 inches and 76 feet 6 inches shall be logged as 76 feet, and any whale between 76 feet 6 inches and 77 feet 6 inches shall be logged as 77 feet. Similarly, any whale between 10.15 metres and 10.25 metres shall be logged as 10.2 metres, and any whale between 10.25 metres and 10.35 metres shall be logged as 10.3 metres. The measurement of any whale which falls on an exact half foot or 0.05 metre shall be logged at the next half foot or 0.05 metre, e.g. 76 feet 6 inches precisely shall be logged as 77 feet and 10.25 metres precisely shall be logged as 10.3 metres.

VI. INFORMATION REQUIRED

24. (*a*) All whale catchers operating in conjunction with a factory ship shall report by radio to the factory ship:
(1) the time when each whale is taken
(2) its species, and
(3) its marking effected pursuant to paragraph 20(b)

(*b*) The information specified in sub-paragraph (a) of this paragraph shall be entered immediately by a factory ship in a permanent record which shall be available at all times for examination by the whaling inspectors; and in addition there shall be entered in such permanent record the following information as soon as it becomes available:
(1) time of hauling up for treatment
(2) length, measured pursuant to paragraph 23
(3) sex
(4) if female, whether lactating
(5) length and sex of foetus, if present, and
(6) a full explanation of each infraction.

(*c*) A record similar to that described in sub-paragraph (*b*) of this paragraph shall be maintained by land stations, and all of the information mentioned in the said sub-paragraph shall be entered therein as soon as available.

(*d*) A record similar to that described in sub-paragraph (*b*) of this paragraph shall be maintained by "small-type whaling" operations conducted from shore or by pelagic fleets, and all of this information mentioned in the said sub-paragraph shall be entered therein as soon as available.

25. (*a*) All Contracting Governments shall report to the Commission for all whale catchers operating in conjunction with factory ships and land stations the following information:
    (1) methods used to kill each whale, other than a harpoon, and in particular compressed air
    (2) number of whales struck but lost.

    (*b*) A record similar to that described in sub-paragraph (*a*) of this paragraph shall be maintained by vessels engaged in "small-type whaling" operations and by native peoples taking species listed in paragraph 1, and all the information mentioned in the said sub-paragraph shall be entered therein as soon as available, and forwarded by Contracting Governments to the Commission.

26. (*a*) Notification shall be given in accordance with the provisions of Article VII of the Convention, within two days after the end of each calendar week, of data on the number of baleen whales by species taken in any waters south of 40° South Latitude by all factory ships or whale catchers attached thereto under the jurisdiction of each Contracting Government, provided that when the number of each of these species taken is deemed by the Secretary to the International Whaling Commission to have reached 85 per cent of whatever total catch limit is imposed by the Commission notification shall be given as aforesaid at the end of each day of data on the number of each of these species taken.

    (*b*) If it appears that the maximum catches of whales permitted by paragraph 11 may be reached before 7 April of any year, the Secretary to the International Whaling Commission shall determine, on the basis of the data provided, the date on which the maximum catch of each of these species shall be deemed to have been reached and shall notify the master of each factory ship and each Contracting Government of that date not less than four days in advance thereof. The taking or attempting to take baleen whales, so notified, by factory ships or whale catchers attached thereto shall be illegal in any waters south of 40° South Latitude after midnight of the date so determined.

    (*c*) Notification shall be given in accordance with the provisions of Article VII of the Convention of each factory ship intending to engage in whaling operations in any waters south of 40° South Latitude.

27. Notification shall be given in accordance with the provisions of Article VII of the Convention with regard to all factory ships and catcher ships of the following statistical information:
    (*a*) concerning the number of whales of each species taken, the number thereof lost, and the number treated at each factory ship or land station, and
    (*b*) as to the aggregate amounts of oil of each grade and quantities of meal, fertiliser (guano), and other products derived from them, together with
    (*c*) particulars with respect to each whale treated in the factory ship, land station or "small-type whaling" operations as to the date and approximate latitude and longitude of taking, the species and sex of the whale, its length and, if it contains a foetus, the length and sex, if ascertainable, of the foetus.

    The data referred to in (*a*) and (*c*) above shall be verified at the time of the tally and there shall also be notification to the Commission of any information which may be collected or obtained concerning the calving grounds and migration of whales.

28. (*a*) Notification shall be given in accordance with the provisions of Article VII of the Convention with regard to all factory ships and catcher ships of the following statistical information:
    (1) the name and gross tonnage of each factory ship,
    (2) for each catcher ship attached to a factory ship or land station:
        (i) the dates on which each is commissioned and ceases whaling for the season,
        (ii) the number of days on which each is at sea on the whaling grounds each season,
        (iii) the gross tonnage, horsepower, length and other characteristics of each; vessels used only as tow boats should be specified.
    (3) A list of the land stations which were in operation during the period concerned, and the number of miles searched per day by aircraft, if any.

    (*b*) The information required under paragraph (*a*)(2)(iii) should also be recorded together with the following information, in the log book format shown in Appendix A, and forwarded to the Commission:
    (1) where possible the time spent each day on different components of the catching operation,
    (2) any modifications of the measures in paragraphs (*a*)(2)(i)-(iii) or (*b*)(1) or data from other suitable indicators of fishing effort for "small-type whaling" operations.

29. (*a*) Where possible all factory ships and land stations shall collect from each whale taken and report on:
    (1) both ovaries or the combined weight of both testes,
    (2) at least one ear plug, or one tooth (preferably first mandibular).

    (*b*) Where possible similar collections to those described in sub-paragraph (a) of this paragraph shall be undertaken and reported by "small-type whaling" operations conducted from shore or by pelagic fleets.

    (*c*) All specimens collected under sub-paragraphs (a) and (b) shall be properly labelled with platform or other identification number of the whale and be appropriately preserved.

    (*d*) Contracting Governments shall arrange for the analysis as soon as possible of the tissue samples and specimens collected under sub-paragraphs (a) and (b) and report to the Commission on the results of such analyses.

30. A Contracting Government shall provide the Secretary to the International Whaling Commission with proposed scientific permits before they are issued and in sufficient time to allow the Scientific Committee to review and comment on them. The proposed permits should specify:
    (*a*) objectives of the research;
    (*b*) number, sex, size and stock of the animals to be taken;

(*c*) opportunities for participation in the research by scientists of other nations; and

(*d*) possible effect on conservation of stock.

Proposed permits shall be reviewed and commented on by the Scientific Committee at Annual Meetings when possible. When permits would be granted prior to the next Annual Meeting, the Secretary shall send the proposed permits to members of the Scientific Committee by mail for their comment and review. Preliminary results of any research resulting from the permits should be made available at the next Annual Meeting of the Scientific Committee.

31. A Contracting Government shall transmit to the Commission copies of all its official laws and regulations relating to whales and whaling and changes in such laws and regulations.

INTERNATIONAL CONVENTION FOR THE REGULATION OF WHALING, 1946, SCHEDULE APPENDIX A

TITLE PAGE
(one logbook per catcher per season)

Catcher name …………………………………………………… Year built ………………………………….

Attached to expedition/land station ……………………………………………………………………………..

Season …………………………………………………………..

Overall length ....………………………….......... Wooden/steel hull …………………………

Gross tonnage ....……………………………

Type of engine ....…………….…………. H.P. ....………………..

Maximum speed ....……………………………...... Average searching speed ....……………

Asdic set, make and model no. ....…………………………...…...……………..

Date of installation ....…………………………

Make and size of cannon ....…………………………………………….

Type of first harpoon used ....………………………..... explosive/electric/non-explosive

Type of killer harpoon used ………………………………………………………………………………..

Length and type of forerunner ……………………………………………………………………………..

Type of whaleline ………………………………………………………………………………………….

Height of barrel above sea level …………………………………

Speedboat used, Yes/No

Name of Captain …………………………………………………………………………………………...

Number of years experience ……………………………………..

Name of gunner …………………………………………………………………………………………

Number of years experience ……………………………………..

Number of crew ………………………………………………….

INTERNATIONAL CONVENTION FOR THE REGULATION OF WHALING, 1946

Humpback..	Sperm ....
Right..	Others (specify) ....
Sei..	....
Signed..	....

*Time whales reported to catcher means the time when the catcher is told of the position of a school and starts to move towards it to chase it.

SCHEDULE APPENDIX A

SCHOOLING REPORT TABLE 2

To be completed by pelagic expedition or coastal station for each sperm whale school chased. A separate form to be used each day.

Name of expedition or coastal station ....

Date .... Noon position of factory ship ....

Time School Found ....

Total Number of Whales in School ....

Number of Takeable Whales in School ....

Number of Whales Caught from School by each Catcher ....

Name of Catcher ....

Name of Catcher ....

Name of Catcher ....

Name of Catcher ....

Total Number Caught from School ....

Remarks:

Explanatory Notes

A. Fill in one column for each school chased with number of whales caught by each catcher taking part in the chase; if catchers chase the school but do not catch from it, enter 0; for catchers in fleet which do not chase that school enter X.

B. A school on this form means a group of whales which are sufficiently close together that a catcher having completed handling one whale can start chasing another whale almost immediately without spending time searching. A solitary whale should be entered as a school of 1 whale.

C. A takeable whale is a whale of a size or kind which the catchers would take if possible. It does not necessarily include all whales above legal size, e.g. if catchers are concentrating on large whales only these would be counted as takeable.

D. Information about catchers from other expeditions or companies operating on the same school should be recorded under Remarks.

Rules of Procedure
and
Financial Regulations

As amended by the Commission at the 56th Annual Meeting, July 2004
(amendments are shown in *bold italics*)

Rules of Procedure

A. Representation

1. A Government party to the International Convention for the Regulation of Whaling, 1946 (hereafter referred to as the Convention) shall have the right to appoint one Commissioner and shall furnish the Secretary of the Commission with the name of its Commissioner and his/her designation and notify the Secretary promptly of any changes in the appointment. The Secretary shall inform other Commissioners of such appointment.

B. Meetings

1. The Commission shall hold a regular Annual Meeting in such place as the Commission may determine. Any Contracting Government desiring to extend an invitation to the Commission to meet in that country shall give formal notice two years in advance. A formal offer should include:
   (a) which meetings it covers, i.e. Scientific Committee, Commission sub-groups, Annual Commission meeting;
   (b) a proposed time window within which the meeting will take place; and
   (c) a timetable for finalising details of the exact timing and location of the meeting.

   Attendance by a majority of the members of the Commission shall constitute a quorum. Special Meetings of the Commission may be called at the direction of the Chair after consultation with the Contracting Governments and Commissioners.
2. Before the end of each Annual Meeting, the Commission shall decide on: (1) the length of the Annual Commission Meeting and associated meetings the following year; and (2) which of the Commission's sub-groups need to meet.

C. Observers

1. (a) Any Government not a party to the Convention or any intergovernmental organisation may be represented at meetings of the Commission by an observer or observers, if such non-party government or intergovernmental organisation has previously attended any meeting of the Commission, or if it submits its request in writing to the Commission 60 days prior to the start of the meeting, or if the Commission issues an invitation to attend.
   (b) Any international organisation with offices in more than three countries may be represented at meetings of the Commission by an observer:
   - if such international organisation has previously attended any meeting of the Commission,

   or
   - if it submits its request in writing to the Commission 60 days prior to the start of the meeting and the Commission issues an invitation with respect to such request.

   Once an international organisation is accredited, it remains accredited until the Commission decides otherwise.
   (c) The Commission shall levy a registration fee and determine rules of conduct, and may define other conditions for the attendance of observers accredited in accordance with Rule C.1.(a) and (b). The registration fee will be treated as an annual fee covering attendance at the Annual Meeting to which it relates and any other meeting of the Commission or its subsidiary groups as provided in Rule C.2 in the interval before the next Annual Meeting.
2. Observers accredited in accordance with Rule C.1. (a) and (b) are admitted to all meetings of the Commission and the Technical Committee, and to any meetings of subsidiary groups of the Commission and the Technical Committee, except the Commissioners-only meetings and the meetings of the Finance and Administration Committee.

D. Credentials

1. (a) The names of all representatives of member and non-member governments and observer organisations to any meeting of the Commission or committees, as specified in the Rules of Procedure of the Commission, Technical and Scientific Committees, shall be notified to the Secretary in writing before their participation and/or attendance at each meeting. For member governments, the notification shall indicate the Commissioner, his/her alternate(s) and advisers, and the head of the national delegation to the Scientific Committee and any alternate(s) as appropriate.

   The written notification shall be made by governments or the heads of organisations as the case may be. In this context, 'governments' means the Head of State, the Head of Government, the Minister of Foreign Affairs (including: on behalf of the Minister of Foreign Affairs), the Minister responsible for whaling or whale conservation (including: on behalf of this Minister), the Head of the Diplomatic Mission accredited to the seat of the Commission or to the host country of the meeting in question, or the Commissioner appointed under Rule A.1.
   (b) Credentials for a Commissioner appointed for the duration of a meeting must be issued as in D.1(a). Thereafter, until the end of the meeting in question, that Commissioner assumes all the powers of a Commissioner appointed under A.1., including that of issuing credentials for his/her delegation.
   (c) In the case of members of delegations who will attend the Annual Commission Meeting and its associated meetings, the notification may be made en bloc by submitting a list of the members who will attend any of these meetings.

(d) The Secretary, or his/her representative, shall report on the received notifications at the beginning of a meeting.

(e) In case of any doubt as to the authenticity of notification or in case of apparent delay in their delivery, the Chair of the meeting shall convene an *ad hoc* group of no more than one representative from any Contracting Government present to decide upon the question of participation in the meeting.

E. Decision-making

The Commission should seek to reach its decisions by consensus. Otherwise, the following Rules of Procedure shall apply:

1. Each Commissioner shall have the right to vote at Plenary Meetings of the Commission and in his/her absence his/her deputy or alternate shall have such right. Experts and advisers may address Plenary Meetings of the Commission but shall not be entitled to vote. They may vote at the meetings of any committee to which they have been appointed, provided that when such vote is taken, representatives of any Contracting Government shall only exercise one vote.

2. (a) The right to vote of representatives of any Contracting Government whose annual payments including any interest due have not been received by the Commission within 3 months of the due date prescribed in Regulation E.2 of the Financial Regulations or by the day before the first day of the next Annual or Special Meeting of the Commission following the due date, or, in the case of a vote by postal or other means, by the date upon which votes must be received, whichever date occurs first, shall be automatically suspended until payment is received by the Commission, unless the Commission decides otherwise.

(b) The Commissioner of a new Contracting Government shall not exercise the right to vote either at meetings or by postal or other means unless the Commission has received the Government's financial contribution or part contribution for the year prescribed in Financial Regulation E.3.

3. (a) Where a vote is taken on any matter before the Commission, a simple majority of those casting an affirmative or negative vote shall be decisive, except that a three-fourths majority of those casting an affirmative or negative vote shall be required for action in pursuance of Article V of the Convention.

(b) Action in pursuance of Article V shall contain the text of the regulations proposed to amend the Schedule. A proposal that does not contain such regulatory text does not constitute an amendment to the Schedule and therefore requires only a simple majority vote. A proposal that does not contain such regulatory text to revise the Schedule but would commit the Commission to amend the Schedule in the future can neither be put to a vote nor adopted.

(c) At meetings of committees appointed by the Commission, a simple majority of those casting an affirmative or negative vote shall also be decisive. The committee shall report to the Commission if the decision has been arrived at as a result of the vote.

(d) Votes shall be taken by show of hands, or by roll call, as in the opinion of the Chair, appears to be most suitable. The election of the Chair, Vice-Chair, the appointment of the Secretary of the Commission, and the selection of IWC Annual Meeting venues shall, upon request by a Commissioner, all proceed by secret ballot.

4. Between meetings of the Commission or in the case of emergency, a vote of the Commissioners may be taken by post, or other means of communication in which case the necessary simple, or where required three-fourths majority, shall be of the total number of Contracting Governments whose right to vote has not been suspended under paragraph 2.

F. Chair

1. The Chair of the Commission shall be elected from time to time from among the Commissioners and shall take office at the conclusion of the Annual Meeting at which he/she is elected. The Chair shall serve for a period of three years and shall not be eligible for re-election as Chair until a further period of three years has elapsed. The Chair shall, however, remain in office until a successor is elected.

2. The duties of the Chair shall be:

(a) to preside at all meetings of the Commission;

(b) to decide all questions of order raised at meetings of the Commission, subject to the right of any Commissioner to request that any ruling by the Chair shall be submitted to the Commission for decision by vote;

(c) to call for votes and to announce the result of the vote to the Commission;

(d) to develop, with appropriate consultation, draft agenda for meetings of the Commission;

(i) for Annual Meetings:

- in consultation with the Secretary, to develop a draft agenda based on decisions and recommendations made at the previous Annual Meeting for circulation to all Contracting Governments and Commissioners for review and comment not less than 100 days in advance of the meeting;
- on the basis of comments and proposals received from Contracting Governments and Commissioners under d(i) above, to develop with the Secretary, an annotated provisional agenda for circulation to all Contracting Governments not less than 60 days in advance of the meeting;

(ii) for Special Meetings, the two-stage procedure described in (i) above will be followed whenever practicable, recognising that Rule of Procedure J.1 still applies with respect to any item of business involving amendment of the Schedule or recommendations under Article VI of the Convention;

(e) to sign, on behalf of the Commission, a report of the proceedings of each annual or other meeting of the Commission, for transmission to Contracting Governments and others concerned as an authoritative record of what transpired;

(f) generally, to make such decisions and give such directions to the Secretary as will ensure, especially in the interval between the meetings of the Commission, that the business of the Commission is carried out efficiently and in accordance with its decision.

G. Vice-Chair

1. The Vice-Chair of the Commission shall be elected from time to time from among the Commissioners and shall preside at meetings of the Commission, or between them, in the absence or in the event of the Chair being unable to act. He/she shall on those occasions exercise the powers and duties prescribed for the Chair. The Vice-Chair shall be elected for a period of three years and shall not be eligible for re-election as Vice-Chair until a further period of three years has elapsed. He/she shall, however, remain in office until a successor is elected.

H. Secretary

1. The Commission shall appoint a Secretary and shall designate staff positions to be filled through appointments made by the Secretary. The Commission shall fix the terms of employment, rate of remuneration including tax assessment and superannuation and travelling expenses for the members of the Secretariat.
2. The Secretary is the executive officer of the Commission and shall:
   (a) be responsible to the Commission for the control and supervision of the staff and management of its office and for the receipt and disbursement of all monies received by the Commission;
   (b) make arrangements for all meetings of the Commission and its committees and provide necessary secretarial assistance;
   (c) prepare and submit to the Chair a draft of the Commission's budget for each year and shall subsequently submit the budget to all Contracting Governments and Commissioners as early as possible before the Annual Meeting;
   (d) despatch by the most expeditious means available:
      (i) a draft agenda for the Annual Commission Meeting to all Contracting Governments and Commissioners 100 days in advance of the meeting for comment and any additions with annotations they wish to propose;
      (ii) an annotated provisional agenda to all Contracting Governments and Commissioners not less than 60 days in advance of the Annual Commission Meeting. Included in the annotations should be a brief description of each item, and in so far as possible, documentation relevant to agenda items should be referred to in the annotation and sent to member nations at the earliest possible date;
   (e) receive, tabulate and publish notifications and other information required by the Convention in such form and manner as may be prescribed by the Commission;
   (f) perform such other functions as may be assigned to him/her by the Commission or its Chair;
   (g) where appropriate, provide copies or availability to a copy of reports of the Commission including reports of Observers under the International Observer Scheme, upon request after such reports have been considered by the Commission.

I. Chair of Scientific Committee

1. The Chair of the Scientific Committee may attend meetings of the Commission and Technical Committee in an *ex officio* capacity without vote, at the invitation of the Chair of the Commission or Technical Committee respectively in order to represent the views of the Scientific Committee.

J. Schedule amendments and recommendations under Article VI

1. No item of business which involves amendment of the Schedule to the Convention, or recommendations under Article VI of the Convention, shall be the subject of decisive action by the Commission unless the subject matter has been included in the annotated provisional agenda circulated to the Commissioners at least 60 days in advance of the meeting at which the matter is to be discussed.

K. Financial

1. The financial year of the Commission shall be from 1st September to 31st August.
2. Any request to Contracting Governments for financial contributions shall be accompanied by a statement of the Commission's expenditure for the appropriate year, actual or estimated.
3. Annual payments and other financial contributions by Contracting Governments shall be made payable to the Commission and shall be in pounds sterling.

L. Offices

1. The seat of the Commission shall be located in the United Kingdom.

M. Committees

1. The Commission shall establish a Scientific Committee, a Technical Committee and a Finance and Administration Committee. Commissioners shall notify their desire to be represented on the Scientific, Technical and Finance and Administration Committees 28 days prior to the meetings, and shall designate the approximate size of their delegations.
2. The Chair may constitute such *ad hoc* committees as may be necessary from time to time, with similar arrangements for notification of the numbers of participants as in paragraph 1 above where appropriate. Each committee shall elect its Chair. The Secretary shall furnish appropriate secretarial services to each committee.
3. Sub-committees and working groups may be designated by the Commission to consider technical issues as appropriate, and each will report to the Technical Committee or the plenary session of the Commission as the Commission may decide.
4. The Scientific Committee shall review the current scientific and statistical information with respect to whales and whaling, shall review current scientific research programmes of Governments, other international organisations or of private organisations, shall review the scientific permits and scientific programmes for which Contracting Governments plan

to issue scientific permits, shall consider such additional matters as may be referred to it by the Commission or by the Chair of the Commission, and shall submit reports and recommendations to the Commission.
5. The preliminary report of the Scientific Committee should be completed and available to all Commissioners by the opening date of the Annual Commission Meeting.
6. The Secretary shall be an *ex officio* member of the Scientific Committee without vote.
7. The Technical Committee shall, as directed by the Commission or the Chair of the Commission, prepare reports and make recommendations on:
   (a) Management principles, categories, criteria and definitions, taking into account the recommendations of the Scientific Committee, as a means of helping the Commission to deal with management issues as they arise;
   (b) technical and practical options for implementation of conservation measures based on Scientific Committee advice;
   (c) the implementation of decisions taken by the Commission through resolutions and through Schedule provisions;
   (d) Commission agenda items assigned to it;
   (e) any other matters.
8. The Finance and Administration Committee shall advise the Commission on expenditure, budgets, scale of contributions, financial regulations, staff questions, and such other matters as the Commission may refer to it from time to time.
9. The Commission shall establish an Advisory Committee. This Committee shall comprise the Chair, Vice-Chair, Chair of the Finance and Administration Committee, Secretary and two Commissioners to broadly represent the interests within the IWC forum. The appointment of the Commissioners shall be for two years on alternative years.
   The role of the Committee shall be to assist and advise the Secretariat on administrative matters upon request by the Secretariat or agreement in the Commission. The Committee is not a decision-making forum and shall not deal with policy matters or administrative matters that are within the scope of the Finance and Administration Committee other than making recommendations to this Committee.

N. Language of the Commission

1. English shall be the official and working language of the Commission but Commissioners may speak in any other language, if desired, it being understood that Commissioners doing so will provide their own interpreters. All official publications and communications of the Commission shall be in English.

O. Records of Meetings

1. The proceedings of the meetings of the Commission and those of its committees shall be recorded in summary form.

P. Reports

1. Commissioners should arrange for reports on the subject of whaling published in their own countries to be sent to the Commission for record purposes.
2. The Chair's Report of the most recent Annual Commission Meeting shall be published in the Annual Report of the year just completed.

Q. Commission Documents

1. Reports of meetings of all committees, sub-committees and working groups of the Commission are confidential (i.e. reporting of discussions, conclusions and recommendations made during a meeting is prohibited) until the opening plenary session of the Commission meeting to which they are submitted, or in the case of intersessional meetings, until after they have been dispatched by the Secretary to Contracting Governments and Commissioners. This applies equally to member governments and observers. Such reports, with the exception of the report of the Finance and Administration Committee, shall be distributed to Commissioners, Contracting Governments and accredited observers at the same time. Procedures applying to the Scientific Committee are contained in its Rules of Procedure E.5.(a) and E.5.(b).
2. Any document submitted to the Commission for distribution to Commissioners, Contracting Governments or members of the Scientific Committee is considered to be in the public domain unless it is designated by the author or government submitting it to be restricted. Such restriction is automatically lifted when the report of the meeting to which it is submitted becomes publicly available under 1. above.
3. Observers admitted under Rule of Procedure C.1.(a) and (b) may submit Opening Statements which will be included in the official documentation of the Annual or other Meeting concerned. They shall be presented in the format and the quantities determined by the Secretariat for meeting documentation.
   The content of the Opening Statements shall be relevant to matters under consideration by the Commission, and shall be in the form of views and comments made to the Commission in general rather than directed to any individual or group of Contracting Governments[1].
4. All meeting documents shall be included in the Commission's archives in the form in which they were considered at the meeting.

R. Amendment of Rules

1. These Rules of Procedure may be amended from time to time by a simple majority of the Commissioners voting, but notice of any proposed amendment shall be despatched by the most expeditious means available to the Commissioners by the Secretary to the Commission not less than 60 days in advance of the meeting at which the matter is to be discussed.

[1] [There is no intention that the Secretariat could conduct advance or *ex-ante* reviews of such statements.]

Financial Regulations

A. Applicability

1. These regulations shall govern the financial administration of the International Whaling Commission.
2. They shall become effective as from the date decided by the Commission and shall be read with and in addition to the Rules of Procedure. They may be amended in the same way as provided under Rule R.1 of the Rules of Procedure in respect of those Rules.
3. In case of doubt as to the interpretation and application of any of these regulations, the Chair is authorised to give a ruling.

B. Financial Year

1. The financial year of the Commission shall be from 1st September to 31st August (Rules of Procedure, Rule K.1).

C. General Financial Arrangements

1. There shall be established a Research Fund and a General Fund, and a Voluntary Fund for Small Cetaceans.
   (a) The Research Fund shall be credited with voluntary contributions and any such monies as the Commission may allocate for research and scientific investigation and charged with specific expenditure of this nature.
   (b) The General Fund shall, subject to the establishment of any other funds that the Commission may determine, be credited or charged with all other income and expenditure.
   (c) The details of the Voluntary Fund for Small Cetaceans are given in Appendix 1.

   The General Fund shall be credited or debited with the balance on the Commission's Income and Expenditure Account at the end of each financial year.
2. Subject to the restrictions and limitations of the following paragraphs, the Commission may accept funds from outside the regular contributions of Contracting Governments.
   (a) The Commission may accept such funds to carry out programmes or activities decided upon by the Commission and/or to advance programmes and activities which are consistent with the objectives and provisions of the Convention.
   (b) The Commission shall not accept external funds from any of the following:
      (i) Sources that are known, through evidence available to the Commission, to have been involved in illegal activities, or activities contrary to the provisions of the Convention;
      (ii) Individual companies directly involved in legal commercial whaling under the Convention;
      (iii) Organisations which have deliberately brought the Commission into public disrepute.
3. Monies in any of the Funds that are not expected to be required for disbursement within a reasonable period may be invested in appropriate Government or similar loans by the Secretary in consultation with the Chair.
4. The Secretary shall:
   (a) establish detailed financial procedures and accounting records as are necessary to ensure effective financial administration and control and the exercise of economy;
   (b) deposit and maintain the funds of the Commission in an account in the name of the Commission in a bank to be approved by the Chair;
   (c) cause all payments to be made on the basis of supporting vouchers and other documents which ensure that the services or goods have been received, and that payment has not previously been made;
   (d) designate the officers of the Secretariat who may receive monies, incur obligations and make payments on behalf of the Commission;
   (e) authorise the writing off of losses of cash, stores and other assets and submit a statement of such amounts written off to the Commission and the auditors with the annual accounts.
5. The accounts of the Commission shall be audited annually by a firm of qualified accountants selected by the Commission. The auditors shall certify that the financial statements are in accord with the books and records of the Commission, that the financial transactions reflected in them have been in accordance with the rules and regulations and that the monies on deposit and in hand have been verified.

D. Yearly Statements

1. At each Annual Meeting, there shall be laid before the Commission two financial statements:
   (a) a provisional statement dealing with the actual and estimated expenditure and income in respect of the current financial year;
   (b) the budget estimate of expenditure and income for the ensuing year including the estimated amount of the individual annual payment to be requested of each Contracting Government.

   Expenditure and income shall be shown under appropriate sub-heads accompanied by such explanations as the Commission may determine.
2. The two financial statements identified in Regulation D.1 shall be despatched by the most expeditious means available to each Contracting Government and each Commissioner not less than 60 days in advance of the Annual Commission Meeting. They shall require the Commission's approval after having been referred to the Finance and Administration Committee for consideration and recommendations. A copy of the final accounts shall be sent to all Contracting Governments after they have been audited.
3. Supplementary estimates may be submitted to the Commission, as and when may be deemed necessary, in a form consistent with the Annual Estimates. Any supplementary estimate shall require the approval of the Commission after being referred to the Finance and Administration Committee for consideration and recommendation.

E. Contributions

1. As soon as the Commission has approved the budget for any year, the Secretary shall send a copy thereof to each Contracting Government (in compliance with Rules of Procedure, Rule K.2), and shall request it to remit its annual payment.
2. Payment shall be in pounds sterling, drafts being made payable to the International Whaling Commission and shall be payable within 90 days of the said request from the Secretary or by the following 28 February, the "due date" whichever is the later. It shall be open to any Contracting Government to postpone the payment of any increased portion of the amount which shall be payable in full by the following 31 August, which then becomes the "due date".
3. New Contracting Governments whose adherence to the Convention becomes effective during the first six months of any financial year shall be liable to pay the full amount of the annual payment for that year, but only half that amount if their adherence falls within the second half of the financial year. The due date for the first payment by new Contracting Governments shall be defined as 6 months from the date of adherence to the Convention or before the first day of its participation in any Annual or Special Meeting of the Commission whichever is the earlier.
   Subsequent annual payments shall be paid in accordance with Financial Regulation E.2.
4. The Secretary shall report at each Annual Meeting the position as regards the collection of annual payments.

F. Arrears of Contributions[2]

1. If a Contracting Government's annual payments have not been received by the Commission by the due date referred to under Regulation E.2. a penalty charge of 10% shall be added to the outstanding annual payment on the day following the due date. If the payment remains outstanding for a further 12 months compound interest shall be added on the anniversary of that day and each subsequent anniversary thereafter at the rate of 2% above the base rate quoted by the Commission's bankers on the day. The interest, calculated to the nearest pound, shall by payable in respect of complete years and continue to be payable in respect of any outstanding balance until such time as the amount in arrears, including interest, is settled in full.
2. If a Contracting Government's annual payments, including any interest due, have not been received by the Commission within 3 months of the due date or by the day before the first day of the next Annual or Special Meeting of the Commission following the due date, or, in the case of a vote by postal or other means, by the date upon which votes must be received, whichever date occurs first, the right to vote of the Contracting Government concerned shall be suspended as provided under Rule E.2 of the Rules of Procedure.
3. Any interest paid by a Contracting Government to the Commission in respect of late annual payments shall be credited to the General Fund.
4. Any payment to the Commission by a Contracting Government in arrears with annual payments shall be used to pay off debts to the Commission, including interest due, in the order in which they were incurred.
5. If a Contracting Government's annual payments, including any interest due, have not been received by the Commission in respect of a period of 3 financial years;
   (a) no further annual contribution will be charged;
   (b) interest will continue to be applied annually in accordance with Financial Regulation F.1.;
   (c) the provisions of this Regulation apply to the Contracting Government for as long as the provisions of Financial Regulations F.1. and F.2. remain in effect for that Government;
   (d) the Contracting Government concerned will be entitled to attend meetings on payment of a fee per delegate at the same level as Non-Member Government observers;
   (e) the provisions of this Regulation and of Financial Regulations F.1. and F.2. will cease to have effect for a Contracting Government if it makes a payment of 2 years outstanding contributions and provides an undertaking to pay the balance of arrears and the interest within a further 2 years;
   (f) interest applied to arrears in accordance with this Regulation will accrue indefinitely except that, if a Government withdraws from the Convention, no further charges shall accrue after the date upon which the withdrawal takes effect.
6. Unless the Commission decides otherwise, a Government which adheres to the Convention without having paid to the Commission any financial obligations incurred prior to its adherence shall, with effect from the date of adherence, be subject to all the penalties prescribed by the Rules of Procedure and Financial Regulations relating to arrears of financial contributions and interest thereon. The penalties shall remain in force until the arrears, including any newly-charged interest, have been paid in full.

[2] For the purposes of the Financial Regulations the expression 'received by the Commission' means either (1) that confirmation has been received from the Commission's bankers that the correct amount has been credited to the Commission's account or (2) that the Secretariat has in its possession cash, a cheque, bankers draft or other valid instrument of the correct value.

Appendix 1

VOLUNTARY FUND FOR SMALL CETACEANS

Purpose

The Commission decided at its 46th Annual Meeting in 1994 to establish an IWC voluntary fund to allow for the participation from developing countries in future small cetacean work and requested the Secretary to make arrangements for the creation of such a fund whereby contributions in cash and in kind can be registered and utilised by the Commission.

Contributions

The Commission has called on Contracting Governments and non-contracting Governments, intergovernmental organisations and other entities as appropriate, in particular those most interested in scientific research on small cetaceans, to contribute to the IWC voluntary fund for small cetaceans.

Acceptance of contributions from entities other than Governments will be subject to the Commission's procedures for voluntary contributions. Where funds or support in kind are to be made available through the Voluntary Fund, the donation will registered and administered by the Secretariat in accordance with Commission procedures.

The Secretariat will notify all members of the Commission on receipt of such voluntary contributions.

Where expenditure is incurred using these voluntary funds the Secretariat will inform the donors of their utilisation.

Distribution of Funds

1. Recognising that there are differences of view on the legal competence of the Commission in relation to small cetaceans, but aware of the need to promote the development of increased participation by developing countries, the following primary forms of disbursement will be supported in accordance with the purpose of the Voluntary Fund:
   (a) provision of support for attendance of invited participants at meetings of the Scientific Committee;
   (b) provision of support for research in areas, species or populations or research methodology in small cetacean work identified as of direct interest or priority in the advice provided by the Scientific Committee to the Commission;
   (c) other small cetacean work in developing countries that may be identified from time to time by the Commission and in consultation with inter-governmental agencies as requiring, or likely to benefit from support through the Fund.
2. Where expenditure is proposed in support of invited participants, the following will apply:
   (a) invited participants will be selected through consultation between the Chair of the Scientific Committee, the Convenor of the appropriate sub-committee and the Secretary;
   (b) the government of the country where the scientists work will be advised of the invitation and asked if it can provide financial support.
3. Where expenditure involves research activity, the following will apply:
   (a) the normal procedures for review of proposals and recommendations by the Scientific Committee will be followed;
   (b) appropriate procedures for reporting of progress and outcomes will be applied and the work reviewed;
   (c) the Secretariat shall solicit the involvement, as appropriate, of governments in the regions where the research activity is undertaken.

Rules of Debate

A. Right to Speak

1. The Chair shall call upon speakers in the order in which they signify their desire to speak.
2. A Commissioner or Observer may speak only if called upon by the Chair, who may call a speaker to order if his/her remarks are not relevant to the subject under discussion.
3. A speaker shall not be interrupted except on a point of order. He/she may, however, with the permission of the Chair, give way during his/her speech to allow any other Commissioner to request elucidation on a particular point in that speech.
4. The Chair of a committee or working group may be accorded precedence for the purpose of explaining the conclusion arrived at by his/her committee or group.

B. Submission of Motions

1. Proposals and amendments shall normally be introduced in writing in the working language of the meeting and shall be submitted to the Secretariat which shall circulate copies to all delegations in the session. As a general rule, no proposal shall be discussed at any plenary session unless copies of it have been circulated to all delegations normally no later than 6pm, or earlier if so determined by the Chair in consultation with the Commissioners, on the day preceding the plenary session. The presiding officer may, however, permit the discussion and consideration of amendments, or motions, as to procedure, even though such amendments, or motions have not been circulated previously.

C. Procedural Motions

1. During the discussion of any matter, a Commissioner may rise to a point of order, and the point of order shall be immediately decided by the Chair in accordance with these Rules of Procedure. A Commissioner may appeal against any ruling of the Chair. The appeal shall be immediately put to the vote and the Chair's ruling shall stand unless a majority of the Commissioners present and voting otherwise decide. A Commissioner rising to a point of order may not speak on the substance of the matter under discussion.
2. The following motions shall have precedence in the following order over all other proposals or motions before the Commission:
   (a) to adjourn the session;
   (b) to adjourn the debate on the particular subject or question under discussion;
   (c) to close the debate on the particular subject or question under discussion.

D. Arrangements for Debate

1. The Commission may, in a proposal by the Chair or by a Commissioner, limit the time to be allowed to each speaker and the number of times the members of a delegation may speak on any question. When the debate is subject to such limits, and a speaker has spoken for his allotted time, the Chair shall call him/her to order without delay.
2. During the course of a debate the Chair may announce the list of speakers, and with the consent of the Commission, declare the list closed. The Chair may, however, accord the right of reply to any Commissioner if a speech delivered after he/she has declared the list closed makes this desirable.
3. During the discussion of any matter, a Commissioner may move the adjournment of the debate on the particular subject or question under discussion. In addition to the proposer of the motion, a Commissioner may speak in favour of, and two Commissioners may speak against the motion, after which the motion shall immediately be put to the vote. The Chair may limit the time to be allowed to speakers under this rule.
4. A Commissioner may at any time move the closure of the debate on the particular subject or question under discussion, whether or not any other Commissioner has signified the wish to speak. Permission to speak on the motion for the closure of the debate shall be accorded only to two Commissioners wishing to speak against the motion, after which the motion shall immediately be put to the vote. The Chair may limit the time to be allowed to speakers under this rule.

E. Procedure for Voting on Motions and Amendments

1. A Commissioner may move that parts of a proposal or of an amendment shall be voted on separately. If objection is made to the request of such division, the motion for division shall be voted upon. Permission to speak on the motion for division shall be accorded only to two Commissioners wishing to speak in favour of, and two Commissioners wishing to speak against, the motion. If the motion for division is carried, those parts of the proposal or amendments which are subsequently approved shall be put to the vote as a whole. If all operative parts of the proposal or of the amendment have been rejected, the proposal or the amendment shall be considered to have been rejected as a whole.
2. When the amendment is moved to a proposal, the amendment shall be voted on first. When two or more amendments are moved to a proposal, the Commission shall first vote on the last amendment moved and then on the next to last, and so on until all amendments have been put to the vote. When, however, the adoption of one amendment necessarily implies the rejection of another amendment, the latter amendment shall not be put to the vote. If one or more amendments are adopted, the amended proposal shall then be voted upon. A motion is considered an amendment to a proposal if it merely adds to, deletes from or revises part of that proposal.
3. If two or more proposals relate to the same question, the Commission shall, unless it otherwise decides, vote on the proposals in the order in which they have been submitted. The Commission may, after voting on a proposal, decide whether to vote on the next proposal.

Rules of Procedure of the Technical Committee

A. Participation

1. Membership shall consist of those member nations that elect to be represented on the Technical Committee. Delegations shall consist of Commissioners, or their nominees, who may be accompanied by technical experts.
2. The Secretary of the Commission or a deputy shall be an *ex officio* non-voting member of the Committee.
3. Observers may attend Committee meetings in accordance with the Rules of the Commission.

B. Organisation

1. Normally the Vice-Chair of the Commission is the Chair of the Technical Committee. Otherwise the Chair shall be elected from among the members of the Committee.
2. A provisional agenda for the Technical Committee and each sub-committee and working group shall be prepared by the Technical Committee Chair with the assistance of the Secretary. After agreement by the Chair of the Commission they shall be distributed to Commissioners 30 days in advance of the Annual Meeting.

C. Meetings

1. The Annual Meeting shall be held between the Scientific Committee and Commission meetings with reasonable overlap of meetings as appropriate to agenda requirements. Special meetings may be held as agreed by the Commission or the Chair of the Commission.
2. Rules of conduct for observers shall conform with rules established by the Commission for meetings of all committees and plenary sessions.

D. Reports

1. Reports and recommendations shall, as far as possible, be developed on the basis of consensus. However, if a consensus is not achievable, the committee, sub-committee or working group shall report the different views expressed. The Chair or any national delegation may request a vote on any issue. Resulting recommendations shall be based on a simple majority of those nations casting an affirmative or negative vote.
2. Documents on which recommendations are based should be available on demand immediately following each committee, sub-committee or working group meeting.
3. Technical papers produced for the Commission may be reviewed by the Committee for publication by the Commission.

Rules of Procedure of the Scientific Committee

TERMS OF REFERENCE

The Scientific Committee, established in accordance with the Commission's Rule of Procedure M.1, has the general terms of reference defined in Rule of Procedure M.4.

In this regard, the DUTIES of the Scientific Committee, can be seen as a progression from the scientific investigation of whales and their environment, leading to assessment of the status of the whale stocks and the impact of catches upon them, and then to provision of management advice on the regulation of whaling. This can be defined in the following terms for the Scientific Committee to:

Encourage, recommend, or if necessary, organise studies and investigations related to whales and whaling [Convention Article IV.1(a)]
Collect and analyse statistical information concerning the current condition and trend of whale stocks and the effects of whaling activities on them [Article IV.1 (b)]
Study, appraise, and disseminate information concerning methods of maintaining and increasing the population of whale stocks [Article IV.1 (c)]
Provide scientific findings on which amendments to the Schedule shall be based to carry out the objectives of the Convention and to provide for the conservation, development and optimum utilization of the whale resources [Article V.2 (a) and (b)]
Publish reports of its activities and findings [Article IV.2]

In addition, specific FUNCTIONS of the Scientific Committee are to:
Receive, review and comment on Special Permits issued for scientific research [Article VIII.3 and Schedule paragraph 30]
Review research programmes of Contracting Governments and other bodies [Rule of Procedure M.4]

SPECIFIC TOPICS of current concern to the Commission include:

Comprehensive Assessment of whale stocks [*Rep. int. Whal. Commn* 34:30]
Implementation of the Revised Management Procedure [*Rep. int. Whal. Commn* 45:43]
Assessment of stocks subject to aboriginal subsistence whaling [Schedule paragraph 13(b)]
Development of the Aboriginal Subsistence Whaling Management Procedure [*Rep. int. Whal. Commn* 45:42-3]
Effects of environmental change on cetaceans [*Rep. int. Whal. Commn* 43:39-40; 44:35; 45:49]
Scientific aspects of whale sanctuaries [*Rep. int. Whal. Commn* 33:21-2; 45:63]
Scientific aspects of small cetaceans [*Rep. int. Whal. Commn* 41:48; 42:48; 43:51; 45:41]
Scientific aspects of whalewatching [*Rep. int. Whal. Commn* 45:49-50]

A. Membership and Observers

1. The Scientific Committee shall be composed of scientists nominated by the Commissioner of each Contracting Government which indicates that it wishes to be represented on that Committee. Commissioners shall identify the head of delegation and any alternate(s) when making nominations to the Scientific Committee. The Secretary of the Commission and relevant members of the Secretariat shall be ex officio non-voting members of the Scientific Committee.
2. The Scientific Committee recognises that representatives of Inter-Governmental Organisations with particular relevance to the work of the Scientific Committee may also participate as non-voting members, subject to the agreement of the Chair of the Committee acting according to such policy as the Commission may decide.
3. Further to paragraph 2 above the World Conservation Union (IUCN) shall have similar status in the Scientific Committee.
4. Non-member governments may be represented by observers at meetings of the Scientific Committee, subject to the arrangements given in Rule C.1(a) of the Commission's Rules of Procedure.
5. Any other international organisation sending an accredited observer to a meeting of the Commission may nominate a scientifically qualified observer to be present at meetings of the Scientific Committee. Any such nomination must reach the Secretary not less than 60 days before the start of the meeting in question and must specify the scientific qualifications and relevant experience of the nominee. The Chair of the Scientific Committee shall decide upon the acceptability of any nomination but may reject it only after consultation with the Chair and Vice-Chair of the Commission. Observers admitted under this rule shall not participate in discussions but the papers and documents of the Scientific Committee shall be made available to them at the same time as to members of the Committee.
6. The Chair of the Committee, acting according to such policy as the Commission or the Scientific Committee may decide, may invite qualified scientists not nominated by a Commissioner to participate by invitation or otherwise in committee meetings as non-voting contributors. They may present and discuss documents and papers for consideration by the Scientific Committee, participate on sub-committees, and they shall receive all Committee documents and papers.
   (a) Convenors will submit suggestions for Invited Participants (including the period of time they would like them to attend) to the Chair (copied to the Secretariat) not less than four months before the meeting in question. The Convenors will base their suggestions on the priorities and initial agenda identified by the Committee and Commission at the previous meeting. The Chair may also consider offers from suitably qualified scientists to contribute to priority items on the Committee's agenda if they submit such an offer to the Secretariat not less than four months before the meeting in question, providing information on the contribution they believe that they can make. Within two weeks of this, the Chair, in consultation with the Convenors and Secretariat, will develop a list of invitees.
   (b) The Secretary will then promptly issue a letter of invitation to those potential Invited Participants suggested by the Chair and Convenors. That letter will state that there may be financial support available, although invitees will be encouraged to find their own support. Invitees who wish to be

considered for travel and subsistence will be asked to submit an estimated airfare (incl. travel to and from the airport) to the Secretariat, within 2 weeks. Under certain circumstances (e.g. the absence of a potential participant from their institute), the Secretariat will determine the likely airfare.

At the same time as (b) a letter will be sent to the government of the country where the scientists is domiciled for the primary purpose of enquiring whether that Government would be prepared to pay for the scientist's participation. If it is, the scientist is no longer an Invited Participant but becomes a national delegate.

(c) At least three months before the meeting, the Secretariat will supply the Chair with a list of participants and the estimated expenditure for each, based on (1) the estimated airfare, (2) the period of time the Chair has indicated the IP should be present and (3) a daily subsistence rate based on the actual cost of the hotel deemed most suitable by the Secretary and Chair[1], plus an appropriate daily allowance.

At the same time as (c) a provisional list of the proposed Invited Participants will be circulated to Commissioners, with a final list attached to the Report of the Scientific Committee.

(d) The Chair will review the estimated total cost for all suggested participants against the money available in the Commission's budget. Should there be insufficient funds, the Chair, in consultation with the Secretariat and Convenors where necessary, will decide on the basis of the identified priorities, which participants should be offered financial support and the period of the meeting for which that support will be provided. Invited Participants without IWC support, and those not supported for the full period, may attend the remainder of the meeting at their own expense.

(e) At least two months before the meeting, the Secretary will send out formal confirmation of the invitations to all the selected scientists, in accordance with the Commission's Guidelines, indicating where appropriate that financial support will be given and the nature of that support.

(f) In exceptional circumstances, the Chair, in consultation with the Convenors and Secretariat, may waive the above time restrictions.

(g) The letter of invitation to Invited Participants will include the following ideas:

(h) Under the Committee's Rules of Procedure, Invited Participants may present and discuss papers, and participate in meetings (including those of subgroups). They are entitled to receive all Committee documents and papers. They may participate fully in discussions pertaining to their area of expertise. However, discussions of Scientific Committee procedures and policies are in principle limited to Committee members nominated by member governments. Such issues will be identified by the Chair of the Committee during discussions. Invited Participants are also urged to use their discretion as regards their involvement in the formulation of potentially controversial recommendations to the Commission; the Chair may at his/her discretion rule them out of order.

(i) After an Invited Participant has his/her participation confirmed through the procedures set up above, a Contracting Government may grant this person national delegate status, thereby entitling him/her to full participation in Committee proceedings, without prejudice to funding arrangements previously agreed upon to support the attendance of the scientist in question.

7. A small number of interested local scientists may be permitted to observe at meetings of the Scientific Committee on application to, and at the discretion of, the Chair. Such scientists should be connected with the local Universities, other scientific institutions or organisations, and should provide the Chair with a note of their scientific qualifications and relevant experience at the time of their application.

B. Agenda

1. The initial agenda for the Committee meeting of the following year shall be developed by the Committee prior to adjournment each year. The agenda should identify, as far as possible, key issues to be discussed at the next meeting and specific papers on issues should be requested by the Committee as appropriate.
2. The provisional agenda for the Committee meeting shall be circulated for comment 60 days prior to the Annual Meeting of the Committee. Comments will normally be considered for incorporation into the draft agenda presented to the opening plenary only if received by the Chair 21 days prior to the beginning of the Annual Meeting.

C. Organisation

1. The Scientific Committee shall include standing sub-committees and working groups by area or species, or other subject, and a standing sub-committee on small cetaceans. The Committee shall decide at each meeting on sub-committees for the coming year.
2. The sub-committees and working groups shall prepare the basic documents on the identification, status and trends of stocks, including biological parameters, and related matters as necessary, for the early consideration of the full Committee.
3. The sub-committees, except for the sub-committee on small cetaceans, shall concentrate their efforts on stocks of large cetaceans, particularly those which are currently exploited or for which exploitation is under consideration, or for which there is concern over their status, but they may examine matters relevant to all cetaceans where appropriate.
4. The Chair may appoint other sub-committees as appropriate.
5. The Committee shall elect from among its members a Chair and Vice-Chair who will normally serve for a period of three years. They shall take office at the conclusion of the annual meeting at which they are elected. The Vice-Chair shall act for the Chair in his/her absence.

[1] [Invited Participants who choose to stay at a cheaper hotel will receive the actual rate for their hotel plus the same daily allowance.]

The election process shall be undertaken by the heads of national delegations who shall consult widely before nominating candidates. The Vice-Chair will become Chair at the end of his/her term (unless he/she declines), and a new Vice-Chair will then be elected. If the Vice-Chair declines to become Chair, then a new Chair must also be elected. If the election of the Chair or Vice-Chair is not by consensus, a vote shall be conducted by the Secretary and verified by the current Chair. A simple majority shall be decisive. In cases where a vote is tied, the Chair shall have the casting vote. If requested by a head of delegation, the vote shall proceed by secret ballot. In these circumstances, the results shall only be reported in terms of which nominee received the most votes, and the vote counts shall not be reported or retained.

D. Meetings

1. Meetings of the Scientific Committee as used in these rules include all meetings of subgroups of the Committee, e.g. sub-committees, working groups, workshops, etc.
2. The Scientific Committee shall meet prior to the Annual Meeting of the Commission. Special meetings of the Scientific Committee or its subgroups may be held as agreed by the Commission or the Chair of the Commission.
3. The Scientific Committee will organise its work in accordance with a schedule determined by the Chair with the advice of a group comprising sub-committee/working group chairs and relevant members of the Secretariat.

E. Scientific Papers and Documents

The following documents and papers will be considered by the Scientific Committee for discussion and inclusion in its report to the Commission:

1. Progress Reports. Each nation having information on the biology of cetaceans, cetacean research, the taking of cetaceans, or other matters it deems appropriate should prepare a brief progress report following in the format agreed by the Committee.
2. Special Reports. The Committee may request special reports as necessary on matters to be considered by the Committee for the following year.
3. Sub-committee Reports. Reports of the sub-committees or working groups shall be included as annexes to the Report to the Commission. Recommendations contained therein shall be subject to modification by the full Committee before inclusion in its Report.
4. Scientific and Working Papers.
   (a) Any scientist may submit a scientific paper for consideration by the Committee. The format and submission procedure shall be in accordance with guidelines established by the Secretariat with the concurrence of the Committee. Papers published elsewhere may be distributed to Committee members for information as relevant to specific topics under consideration.
   (b) Scientific papers will be considered for discussion and inclusion in the papers of the Committee only if the paper is received by the Secretariat on or by the first day of the annual Committee meeting, intersessional meeting or any sub-group. Exceptions to this rule can be granted by the Chair of the Committee where there are exceptional extenuating circumstances.
   (c) Working papers will be distributed for discussion only if prior permission is given by the Chair of the committee or relevant sub-group. They will be archived only if they are appended to the meeting report.
   (d) The Scientific Committee may receive and consider unpublished scientific documents from non-members of the Committee (including observers) and may invite them to introduce their documents at a meeting of the Committee provided that they are received under the same conditions (with regard to timing etc.) that apply to members.
5. Publication of Scientific Papers and Reports.
   (a) Scientific papers and reports considered by the Committee that are not already published shall be included in the Commission's archives in the form in which they were considered by the Committee or its sub-committees. Papers submitted to meetings shall be available on request at the same time as the report of the meeting concerned (see (b) below).
   (b) The report of the Annual Meeting of the Scientific Committee shall be distributed to the Commission no later than the beginning of the opening plenary of the Annual Commission Meeting and is confidential until this time.

   Reports of intersessional Workshops or Special Committee Meetings are confidential until they have been dispatched by the Secretary to the full Committee, Commissioners and Contracting Governments.

   Reports of intersessional Steering Groups or Sub-committees are confidential until they have been discussed by the Scientific Committee, normally at an Annual Meeting.

   In this context, 'confidential' means that reporting of discussions, conclusions and recommendations is prohibited. This applies equally to Scientific Committee members, invited participants and observers. Reports shall be distributed to Commissioners, Contracting Governments and accredited observers at the same time.

   The Scientific Committee should identify the category of any intersessional meetings at the time they are recommended.
   (c) Scientific papers and reports (revised as necessary) may be considered for publication by the Commission. Papers shall be subject to peer review before publication. Papers submitted shall follow the Guidelines for Authors published by the Commission.

F. Review of Scientific Permits

1. When proposed scientific permits are sent to the Secretariat before they are issued by national governments the Scientific Committee shall review the scientific aspects of the proposed research at its annual meeting, or during a special meeting called for that purpose and comment on them to the Commission.

2. The review process shall take into account guidelines issued by the Commission.
3. The proposed permits and supporting documents should include specifics as to the objectives of the research, number, sex, size, and stock of the animals to be taken, opportunities for participation in the research by scientists of other nations, and the possible effect on conservation of the stock resulting from granting the permits.
4. Preliminary results of any research resulting from the permits should be made available for the next meeting of the Scientific Committee as part of the national progress report or as a special report, paper or series of papers.

G. Financial Support for Research Proposals

1. The Scientific Committee shall identify research needs.
2. It shall consider unsolicited research proposals seeking financial support from the Commission to address these needs. A sub-committee shall be established to review and rank research proposals received 4 months in advance of the Annual Meeting and shall make recommendations to the full Committee.
3. The Scientific Committee shall recommend in priority order those research proposals for Commission financial support as it judges best meet its objectives.

H. Availability of data

The Scientific Committee shall work with the Secretariat to ensure that catch and scientific data that the Commission holds are archived and accessible using modern computer data handling techniques. Access to such data shall be subject to the following rules.

1. Information identified in Section VI of the Schedule that shall be notified or forwarded to the IWC or other body designated under Article VII of the Convention. This information is available on request through the Secretariat to any interested persons with a legitimate claim relative to the aims and purposes of the Convention[2].
2. Information and reports provided where possible under Section VI of the Schedule.
   When such information is forwarded to the IWC a covering letter should make it clear that the information or report is being made available, and it should identify the pertinent Schedule paragraph under which the information or report is being submitted.
   Information made available to the IWC under this provision is accessible to accredited persons as defined under 4. below, and additionally to other interested persons subject to the agreement of the government submitting the information or report.
   Such information already held by the Commission is not regarded as having been forwarded until such clarification of its status is received from the government concerned.
3. Information neither required nor requested under the Schedule but which has been or might be made available to the Commission on a voluntary basis.
   This information is of a substantially different status from the previous two types. It can be further divided into two categories:

(a) Information collected under International Schemes.

  (i) Data from the IWC sponsored projects.
  (ii) Data from the International Marking Scheme.
  (iii) Data obtained from international collaborative activities which are offered by the sponsors and accepted as contributions to the Comprehensive Assessment, or proposed by the Scientific Committee itself.

  Information collected as the result of IWC sponsored activities and/or on a collaborative basis with other organisations, governments, institutions or individuals is available within those contributing bodies either immediately, or, after mutual agreement between the IWC and the relevant body/person, after a suitable time interval to allow 'first use' rights to the primary contributors.

(b) Information collected under national programmes, or other than in (a). Information in this category is likely to be provided by governments under special conditions and would hence be subject to some degree of restriction of access. This information can only be held under the following conditions:

  (i) A minimum level of access should be that such data could be used by accredited persons during the Scientific Committee meetings using validated techniques or methods agreed by the Scientific Committee. After the meeting, at the request of the Scientific Committee, such data could be accessed by the Secretariat for use with previously specified techniques or validated programs. Information thus made available to accredited persons should not be passed on to third parties but governments might be asked to consider making such records more widely available or accessible.
  (ii) The restrictions should be specified at the time the information is provided and these should be the only restrictions.
  (iii) Restrictions on access should not discriminate amongst accredited persons.
  (iv) All information held should be documented (i.e. described) so that accredited persons know what is held, along with stated restrictions on the access to it and the procedures needed to obtain permission for access.

4. Accredited persons are those scientists defined under sections A.1, 2, 3 and 6 of the Rules of Procedure of the Scientific Committee. Invited participants are also considered as 'accredited' during the intersessional period following the meeting which they attend.

[2][The Government of Norway notes that for reasons of domestic legislation it is only able to agree that data it provided under this paragraph are made available to accredited persons.]

Report of the Scientific Committee

The meeting was held at Centre de Congrès, Les Dunes d'Or, Agadir, Morocco from 30 May-11 June 2010 and was chaired by Debra Palka. A list of participants is given as Annex A.

1. INTRODUCTORY ITEMS

1.1 Chair's welcome and opening remarks

Palka welcomed the participants to the meeting. She thanked the Government of Morocco for hosting the meeting and for providing excellent facilities along with fabulous weather. She also expressed thanks for the beautiful artwork exhibited throughout the meeting venue.

With sadness, the Committee noted that Sidney Brown had passed away since the 2009 meeting. Sidney was a long-standing member of the Committee from the early 1960s to the mid 1980s. He was particularly involved in the Discovery Whale Marking Scheme, for which he was responsible for maintaining records of marks fired and recovered, ordering supplies and ensuring their availability for relevant whaling and scientific operations, and writing up the results. His advice on all things cetacean was much sought and greatly respected. His modest English manner belied a shrewd intellect and wide range of interests in maritime history and exploration. A minute of silence was observed in his memory.

1.2 Appointment of rapporteurs

Donovan was appointed rapporteur with assistance from various members of the Committee as appropriate. The Committee gave particular thanks to Butterworth for rapporteuring Item 20. Chairs of sub-committees and Working Groups appointed rapporteurs for their individual meetings.

1.3 Meeting procedures and time schedule

Grandy summarised the meeting arrangements and information for participants. The Committee agreed to follow the work schedule prepared by the Chair.

1.4 Establishment of sub-committees and Working Groups

Two pre-meetings preceded the start of the Scientific Committee. The Working Group on the *pre-Implementation assessment* of Western North Pacific Common Minke Whales (NPM) and the correspondence Working Group on Abundance Analysis Methods for Southern Hemisphere Minke Whales met from 28-29 May, during which agenda items covered were incorporated into their main agendas and reports (Annexes D1 and G respectively).

A number of sub-committees and Working Groups were established. Their reports were either made annexes (see below) or subsumed into this report.

Annex D – Sub-Committee on the Revised Management Procedure (RMP);
Annex D1 – Working Group on the *pre-Implementation assessment* of Western North Pacific common minke whales (NPM);
Annex E – Standing Working Group on an Aboriginal Whaling Management Procedure (AWMP);
Annex F – Sub-Committee on Bowhead, Right and Gray Whales (BRG);
Annex G – Sub-Committee on In-Depth Assessments (IA);
Annex H – Sub-Committee on Other Southern Hemisphere Whale Stocks (SH);
Annex I – Working Group on Stock Definition (SD);
Annex J – Working Group on Estimation of Bycatch and other Human-Induced Mortality (BC);
Annex K – Standing Working Group on Environmental Concerns (E);
Annex K1 – Working Group to Address Multi-species and Ecosystem Modelling Approaches (EM);
Annex L – Standing Sub-Committee on Small Cetaceans (SM);
Annex M – Sub-Committee on Whalewatching (WW); and
Annex N – Working Group on DNA (DNA).

1.5 Computing arrangements

Allison outlined the computing and printing facilities available for delegate use. Requests for Secretariat computing are addressed according to the priority assigned by the Convenors.

2. ADOPTION OF AGENDA

The adopted Agenda is given as Annex B1. Statements on the Agenda are given as Annex U. The Agenda took into account the priority items agreed last year and approved by the Commission (IWC, 2010c). Annex B2 links the Committee's Agenda with that of the Commission.

3. REVIEW OF AVAILABLE DATA, DOCUMENTS AND REPORTS

3.1 Documents submitted

Donovan noted that the pre-registration procedure, coupled with the availability of electronic papers, had again been successful. With such a large number of documents, pre-specifying papers had reduced the amount of photocopying and unnecessary paper dramatically. He was pleased to note that this year, the percentage of people opting to receive their primary papers entirely electronically (27%) was almost triple that of last year (10%) and he hoped that this percentage would continue to grow in future years. The list of documents is given as Annex C.

3.2 National Progress Reports on research

National Progress Reports presented at the 2002-10 meetings are accessible on the IWC website. Reports from previous years will also become available in this format in the future.

The Committee reaffirmed its view of the importance of national Progress Reports and **recommends** that the Commission continues to urge member nations to submit them following the approved guidelines (IWC, 1993). Non-member nations wishing to submit progress reports are welcome to do so. The Secretariat is looking into the possibility of online submission of the data included in national Progress Reports; a simplified progress report template has also been developed (see Annex P).

A summary of the information included in the reports presented this year is given as Annex O; the report template,

Table 1
List of data and programs received by the IWC Secretariat since the 2009 meeting.

Date	From	IWC ref.	Details
Catch data from the previous season:			
03/05/10	Norway: N. Øien	E84 Cat09	Individual minke catch records from the Norwegian 2009 commercial catch. Access restricted (specified 14-11-00).
31/05/10	Iceland: G. Víkingsson	E87 Cat09	Individual catch records from the Icelandic commercial catch 2009.
31/05/10	Japan: H. Okada	E88 Cat09	Individual catch records from the Japanese 2009 North Pacific special permit catch (JARPN II) and 2009/10 Antarctic special permit catch (JARPA II).
31/05/10	Russia: R.G. Borodin	E89 Cat09	Individual catch records from the aboriginal harvest in the Russian Federation in 2009.
03/06/10	St.Vincent: L. Edwards	E90 Cat10	Individual catch records from St. Vincent and The Grenadines for the 2010 humpback harvest.
Sightings data/programs:			
22/02/10	K. Sekiguchi	E86 CD92a-n	2009/10 SOWER cruise photographs and data including sightings, effort, waypoint, ice edge, weather.
00/04/10	L. Burt	CD93	DESS Version 3.63 2010.
30/05/10	Japan: K. Matsuoka	CD94	ICR blue whale photo-id pictures from JARPA 1987/88-2004/05 submitted under IWC data access Procedure B.

is available on the IWC website (*http://www.iwcoffice.org/sci_com/scprogress/htm*). The importance of using the agreed template was **emphasised** by the Committee.

3.3 Data collection, storage and manipulation

3.3.1 Catch data and other statistical material

Table 1 lists data received by the Secretariat since the 2009 meeting.

3.3.2 Progress of data coding projects and computing tasks

Allison reported that work has continued on the entry of catch data into both the IWC individual and summary catch databases, including data received from the 2008 season. Work has focused on updating data for eastern North Pacific gray whales (see Item 9.2) and data from the North Atlantic in the period 1897-1930. Version 5.0 of the catch databases will be available shortly. Entry of data into the bycatch database developed by Simon Northridge has continued with data from the 2004 and 2008 seasons being added. Data from the 2008/09 SOWER sightings cruise have been validated and incorporated into the DESS database and work on encoding and validation of data from the 2009/10 cruise has begun. Burt and Hughes began an audit of the Western North Pacific Bryde's whale survey data intersessionally and this work was completed during the course of the meeting.

Programming work during the past year is discussed later under the relevant agenda items.

4. COOPERATION WITH OTHER ORGANISATIONS

4.1 Convention on the Conservation of Migratory Species (CMS)

4.1.1 Scientific Council

There were no meetings of the Scientific Council during the intersessional period. Perrin will represent the IWC at its next meeting.

4.1.2 Conference of Parties (COP)

There were no meetings of the Conference of Parties during the intersessional period. The Secretariat will represent the IWC at the next COP.

4.1.3 Agreement on Small Cetaceans of the Baltic and North Seas (ASCOBANS)

The report of the IWC observer at the 6th Meeting of the Parties to ASCOBANS held in Bonn, Germany from 16-18 September 2009 is given as IWC/62/4D. The main topics of relevance to the IWC are summarised as follows:

(1) a new version of the Recovery Plan for Baltic Harbour Porpoises was adopted;
(2) a new Conservation Plan for the Harbour Porpoise in the North Sea was adopted; and
(3) the meeting agreed on guidelines to address the adverse affects of underwater noise on marine mammals during offshore construction activities for renewable energy production.

The 17th meeting of the Advisory Committee to ASCOBANS had been scheduled to take place from 21-23 April 2010 in Cornwall. This was postponed due to flight restrictions caused by volcanic eruptions in Iceland. It has been rescheduled for 4-6 October 2010 in Bonn, Germany.

The Committee thanked Scheidat for her report and **agrees** that she should represent the Committee as an observer at the next ASCOBANS Advisory Committee meeting and Meeting of Parties. Further information can be found at *http://www.ascobans.org*.

4.1.4 Agreement on the Conservation of Cetaceans of the Black Sea, Mediterranean Sea and Contiguous Atlantic Area (ACCOBAMS)

The ACCOBAMS Scientific Committee met in Casablanca from the 11-13 January 2010, primarily to prepare information for the forthcoming Meeting of Parties that will be held from 9-12 November 2010 in Monaco. It was attended by members of the Scientific Committee, representatives from the Sub-Regional Coordination Units, representatives from International Organisations and observers including partners of ACCOBAMS. The report of the IWC observer is given as IWC/62/4M.

Nine recommendations and a Declaration expressing the Committee's concern about the slow and/or limited level of implementation of the Agreement to effectively address the conservation problems affecting cetaceans in the Agreement area were adopted by the Committee during the meeting:

Recommendation	Topic
6.1	ACCOBAMS Survey Initiative
6.2	Programme of work on population structure
6.3	Conservation of Mediterranean common dolphins
6.4	Ship strikes
6.5	Marine Protected Areas
6.6	Anthropogenic noise
6.7	Monitoring, assessment and reducing cetacean bycatch in the Black Sea
6.8	Climate change
6.9	Minimum funding for the Scientific Committee

The next meeting of the Scientific Committee is planned for early 2011. The full report of the Scientific Committee can be found on the ACCOBAMS website *http://www.accobams.org*. The Committee thanked Donovan for his report and **agrees** that he should represent the IWC at the forthcoming Meeting of the Parties and Scientific Committee meetings.

4.1.5 Memorandum of Understanding (MoU) on the Conservation of the Manatee and Small Cetaceans of Western Africa and Macaronesia

There was no report related to the MoU on the Conservation of the Manatee and Small Cetaceans of Western Africa and Macaronesia. Perrin will represent the Committee at future activities.

4.1.6 Memorandum of Understanding (MoU) for the Conservation of Cetaceans and Their Habitats in the Pacific Islands Region (MoU for Pacific Islands Cetaceans)

The report of the IWC observer at the 2nd meeting of the MoU for Pacific Islands Cetaceans held 28-29 July 2009 in Auckland, New Zealand is given as IWC/62/4E. The meeting was attended by most of the signatories (Australia, Cook Islands, Fiji, French Polynesia, New Caledonia, New Zealand, Niue, Papua New Guinea, Samoa and the Solomon Islands). Federated States of Micronesia was unable to attend, and Tonga attended as an observer. The UK, on behalf of the Pitcairn Islands, signed the MoU at the meeting, bringing the total number of signatories to twelve.

The meeting, *inter alia*, reviewed progress in cetacean conservation in the region, endorsed a proposal to develop an Oceania Humpback Whale Recovery Plan and adopted an Action Plan for the MoU. An offer by the Whale and Dolphin Conservation Society (WDCS) to convene a Pacific Cetaceans MoU Technical Advisory Group was gratefully accepted. The meeting also noted with appreciation the continued support by WDCS for the development of the CMS Pacific MoU website: *http://www.pacificcetaceans.org*. The Committee thanked Donohue for his report and **agrees** that he should represent the Committee at the next meeting of the MoU for Pacific Islands. Further information can be found at *http://www.cms.int/species/pacific_cet/pacific_cet_bkrd.htm*.

4.2 International Council for the Exploration of the Sea (ICES)

The report of the IWC observer documenting the 2009 activities of ICES is given as IWC/62/4B. The ICES Working Group on Marine Mammal Ecology (WGMME) met in February 2009. Issues considered included management procedures for estimating bycatch limits for small cetaceans, assessing population and stock structure in small cetaceans, improvements in the procedure for reporting on favourable Conservation Status (FSC) under the EU habitats Directive, and developing a framework for monitoring and surveillance of European marine mammal populations.

A review of the ASCOBANS/HELCOM Working Group (WG) on common dolphin population structure in the Northeast Atlantic was conducted. The WGMME concurred with the recommendation that only one common dolphin population inhabits the Northeast Atlantic, although the distributional range of the population is unknown. A separate Iberian harbour porpoise population has recently been identified using genetic analysis and the WGMME strongly recommended that this population be given a high priority for conservation. The WGMME also strongly recommended immediate action by the Spanish and Portuguese governments in monitoring and conserving the Iberian harbour porpoise population.

New data from the SCANS II and CODA projects were reviewed and the WGMME concurred with the recommendation to use the *Catch Limit Algorithm* approach for estimating bycatch limits for small cetaceans.

The WG noted that the continuation and establishment of national observer bycatch programmes is extremely important in order to obtain current estimates of incidental capture for all marine mammal species. The WG also noted the need for the continuation of surveys such as SCANS II and CODA at least every 5-10 years in order to estimate absolute abundance.

Initial development of a European framework for surveillance and monitoring of marine mammals was undertaken. While it is clear that monitoring of abundance, bycatch and health status may reasonably form the core of surveillance for cetaceans, the importance of other types of information (e.g. life history data) and monitoring of specific threats (e.g. offshore construction) should also be recognised when designing a surveillance strategy. Further, monitoring programme design should take account of new findings on the target stock's structure.

The 2009 ICES Annual Science Conference (ASC) was held in Berlin, Germany, 21-25 September 2009. Some sessions were designed with marine mammals included as an integral part. A number of sessions were of relevance to the Committee, including those describing:

(1) advances in marine ecosystem research;
(2) comparative study of climate impact on coastal and continental shelf ecosystems in the ICES area;
(3) habitat science to support stock assessment;
(4) avoidance of bycatch and discards; and
(5) ecological foodweb and network analysis.

The Committee thanked Haug for the report and **agrees** that he should represent the Committee as an observer at the next ICES meeting.

4.3 Inter-American Tropical Tuna Commission (IATTC)

No observer for the IWC attended the 2009 meeting of IATTC.

4.4 International Commission for the Conservation of Atlantic Tunas (ICCAT)

The report of the IWC observer to the 21st meeting of ICCAT is given as IWC/62/4J. The critical status of some stocks was highlighted, including the bluefin tuna, and measures adopted to allow the rebuilding of stocks as well as measures to improve the management frameworks and status for swordfish and albacore. The Committee thanked Corrêa for attaneding the meeting on its behalf.

4.5 Convention for the Conservation of Antarctic Marine Living Resources (CCAMLR)

The report of the IWC observer at the 28th Meeting of the CCAMLR Scientific Committee (CCAMLR-SC), held in Hobart, Australia from 23-27 October 2009 is given as IWC/61/4A. The main items considered at the CCAMLR meeting of relevance to the IWC included: (1) fishery status and trends of Antarctic fish stocks, krill, squid and stone crabs; (2) incidental mortality of seabirds and marine mammals in fisheries in the CCAMLR Convention Area; (3) harvested species (krill, fish, and stone crabs and their assessment); (4) ecosystem monitoring and management; (5) management under conditions of uncertainty about stock size and sustainable yield; (6) scientific research exemption; (7) CCAMLR Scheme of International Scientific Observation; (8) new and exploratory fisheries; (9) joint CCAMLR-IWC workshop with respect to ecosystem modelling in the Southern Ocean; and (10) the CCAMLR performance review.

Marine Protected Areas were discussed in detail. The area of the southern South Orkney shelf and the Seasonal Pack-ice Zone and part of the Fast Ice Zone south of the Shelf was the first MPA designated by CCAMLR. The following milestones were previously agreed: (1) by 2010, collate relevant data for as many of the 11 priority regions as possible; (2) by 2010, submit proposals on a representative system of MPAs to the CCAMLR Commission; (3) by early 2011, convene a workshop to review progress, share experience and determine a work programme for the identification of MPAs; and (4) by 2011, submit proposals for areas for protection to the CCAMLR-SC.

Two reports of cetacean-fisheries interactions in the Southern Ocean were received by CCAMLR in 2009: (1) a killer whale hooked on a line was dead when brought to the surface; and (2) a sperm whale hauled up dead after being caught in discarded fishing gear on the seabed.

The Committee thanked Kock for attending on its behalf and **agrees** that he should represent the Committee as an observer at the next CCAMLR-SC meeting.

4.6 Southern Ocean GLOBEC (SO-GLOBEC)

The synthesis and analysis process under SO-GLOBEC has continued and has produced a number of papers relating cetacean distribution to prey and other environmental variables. There is no active work with respect to SO-GLOBEC at this time.

4.7 North Atlantic Marine Mammal Commission (NAMMCO)

Scientific Committee

The report of the IWC observer at the 16th meeting of the NAMMCO Scientific Committee held in Reykjavik, Iceland 19-22 April 2009 is given as IWC/62/4L.

The Working Group on Marine Mammals-Fisheries (MMFI WG) considered: (1) new developments in the quantitative description of marine mammal diet by species; (2) new developments in the estimation of energy consumption; and (3) recent developments in multi-species modelling. In light of the report of the WG, the NAMMCO SC agreed that multi-species modelling is a valid approach for understanding ecological relations between species. However, it was noted that ecosystem models have significant data requirements, many of which are currently unavailable. In order to improve the understanding of such modelling, an exercise is planned in which four different modelling approaches are used to describe the same ecosystem.

A successful survey of narwhals was conducted in East Greenland during August 2008. The abundance estimates developed from this are the first for the Scoresby Sound fjord system south to Ammassalik. The abundance estimate for narwhals in Melville Bay, developed from the 2007 survey is the first estimate from this locality. The NAMMCO SC recommended catches be set so that there is at least a 70% probability that management objectives be met for West and East Greenland narwhals, i.e. maximum total removals of 310 and 85 narwhals in West and East Greenland respectively.

At the last NAMMCO SC meeting it was recognised that the preliminary data on abundance of narwhals and white whales show higher estimates and encouraged Greenland to submit fully corrected estimates. These were submitted to and endorsed by the NAMMCO/JCNB Joint Working Group in February 2009.

The Committee thanked Walløe for attending on its behalf and **agrees** that he should represent the Committee as an observer at the next NAMMCO SC meeting.

Council

The report of the IWC observer at the 17th Annual Meeting of NAMMCO held in Tromso, Norway in September 2009 is given as IWC/61/4F. The whaling and sealing nations in the North Atlantic confirmed their commitment to ensuring the sustainable utilisation of marine mammals through science-bases management decisions, stressing the vital importance marine mammals have as renewable resources for economies and cultures across the region.

Key conclusions from the meeting relevant to IWC included:

(1) welcoming Greenland's multi-annual catch quotas for white whales and narwhal stocks;
(2) a recommendation from the NAMMCO SC that a quota of 10 humpback whales in West Greenland, including struck and lost animals, would be sustainable;
(3) initiation of an ecosystem modelling programme; and
(4) agreement to convene an expert working group to undertake a review and evaluate the whale killing data submitted to NAMMCO by Japan and to look at data and information on recent and ongoing research on improvements and technical innovations in hunting methods and gears used for the hunting of large whales in NAMMCO countries.

The Committee thanked Goodman for attending on its behalf and **agrees** that he should represent the Committee as an observer at the next NAMMCO Council meeting. Further information on NAMMCO can be found at *http://www.nammco.no.*

4.8 International Union for the Conservation of Nature (IUCN)

Cooke and Larsen, the IWC observers, reported on the considerable cooperation with IUCN that had occurred during the past year and this is given as IWC/62/4K.

Western gray whales (see also Item 10.4)

The IUCN Western Gray Whale Advisory Panel has continued its work (*http://www.iucn.org/wgwap*). The Panel had earlier advised that a seismic survey commissioned by Sakhalin Energy and scheduled for 2009 in the Astokh area be postponed, in view of the anomalous (and possibly disturbance-related) distribution of gray whales off Sakhalin in 2008. Given the apparent return to normal gray whale distribution in the area in 2009, the Panel agreed that carrying out of the survey in 2010 was acceptable, particularly in the light of the jointly developed, improved monitoring and mitigation measures and completion of the survey early in the season before large numbers of whales arrive in the Piltun feeding area.

The Panel was extremely concerned to learn that a further seismic survey is planned for July-September 2010 by the company Rosneft Shelf - Far East, to cover the Lebedenskoie field which underlies the northern part of the prime near-shore feeding ground of western gray whales The IUCN Director General has written to Prime Minister Putin urging the Russian government to order the postponement of the survey at least until 2011 to enable satisfactory mitigation measures to be put in place to minimise the disturbance to whales[1]. A draft Western Gray Whale Conservation Plan has been developed with the help of the IUCN Marine Programme as part of its Range-Wide Conservation Initiative for western Gray Whales (SC/62/BRG24).

Red List updates
Following the comprehensive updating of the Red List entries for cetaceans in 2008, the Cetacean Specialist Group has completed separate assessments of the two species of *Sotalia*, the freshwater tucuxi and the coastal marine and estuarine Guiana dolphin. Draft assessments of a number of Mediterranean subpopulations (fin whale, sperm whale, long-finned pilot whale, Risso's dolphin, striped dolphin, common bottlenose dolphin and Cuvier's beaked whale) are in review.

Asian freshwater cetaceans (see also Item 14.3)
The Cetacean Specialist Group has undertaken several initiatives in Asia over the past year. These have included, most notably a workshop in Samarinda, East Kalimantan, Indonesia in October 2009 on freshwater protected areas for dolphins; a special meeting in Phnom Penh, Cambodia in November 2009 on the conservation of Irrawaddy dolphins in the Mekong River; and a meeting in Patna, India in February 2010 to assist in the development of a national action plan for the conservation of Ganges river dolphins (*Susus*).

The Committee thanked Cooke and Larsen for their report and **agrees** that they should continue to act as observers to IUCN for the IWC. Further information on IUCN can be found at *http://www.iucn.org.*

4.9 Food and Agriculture Organisation (FAO) related meetings – Committee on Fisheries (COFI)
There was no meeting of COFI in 2010. Further information on FAO can be found at *http://www.fao.org*.

4.10 Convention on International Trade in Endangered Species of Wild Flora and Fauna (CITES)
The report of the IWC observer at the 15th meeting of the CITES Conference of the Parties held 13-25 March 2010 in, Doha, Qatar is given as IWC/62/4H. There were no proposals for changing the listing of whale stocks from Appendix I to Appendix II (downlisting). There were also no proposals for changing the listing of a dolphin or whale species from Appendix II to Appendix I (uplisting).

The CITES Secretariat reviewed all of the Decisions that were in effect after the 14th meeting of the Conference of the Parties, including a recommendation to delete Decision 14.81 relating to great whales. Decision 14.81 states that 'No periodic review of any great whale, including the fin whale, should occur while the moratorium by the International Whaling Commission is in place'. The CITES Secretariat recommendation also noted that if the substance of this Decision should remain in effect, it should be considered in the context of the draft resolution on the periodic review of the Appendices.

A number of Parties opposed its deletion on the basis that the draft resolution on the periodic review had not been accepted. After a vote, the recommendation to delete the Decision was rejected.

The Committee thanked the US Government for attending on its behalf and **agrees** that it should represent the Committee as an observer at the next CITES meeting. Information on CITES can be found at *http://www.cites.org.*

4.11 North Pacific Marine Science Organisation (PICES)
The report of the IWC observer at the 18th annual meeting of PICES held 23 October-1 November 2009 in Jeju, Republic of Korea is given as IWC/62/4G. The Marine Birds and Mammals Advisory Group (AP-MBM), cosponsored by ICES held a theme session on 'integrating marine mammal populations and rates of prey consumption in models and forecasts of climate change-ecosystem change in the North Pacific and North Atlantic Oceans'. A diverse range of topics were covered, including population trends, diet, estimates of prey consumption and models of trophic impact. AP-MBM reviewed aspects of the new PICES science programme (FUTURE), specifically: (1) understanding climate change and anthropogenic impacts on marine ecosystems; (2) forecasting future ecosystem change; and (3) better communication with society. The AP reiterated its primary mission to provide advice to the PICES community about the role of marine birds and mammals in marine ecosystems. Based on its role in FUTURE the AP-MBM defined its focal points as: (1) spatial ecology of predators in marine ecosystems; (2) models of prey consumption of top predators; (3) marine birds and mammals as indicators of ecosystem change; (4) marine mammals as autonomous oceanographic sampling devices; and (5) providing advice to the PICES community.

The Committee thanked Kato for attending on its behalf and **agrees** that he should represent the Committee as an observer at the next PICES meeting. Further information on PICES can be found at *http://www.pices.int*.

4.12 Eastern Caribbean Cetacean Commission (ECCO)
No information on the activities of ECCO was provided.

4.13 Protocol on Specially Protected Areas and Wildlife (SPAW) of the Cartagena Convention for the Wider Caribbean
There were no meetings of SPAW during the intersessional period. Carlson will represent the IWC at its next meeting. Further information on SPAW can be found at *http://www.cep.unep.org/cartagena-convention*.

4.14 Indian Ocean Commission (IOC)
No information on the activities of IOC was provided. Further information on the IOC can be found at *http://www.coi-ioc.org*.

4.15 Permanent Commission for the South Pacific (CPPS)
No information on the activities of CPPS was provided. Further information on CPPS can be found at *http://www.cpps-int.org*.

4.16 International Maritime Organisation (IMO)
The report of the IWC observer at the General Assembly of the IMO held 23 November-4 December 2009 is given as IWC/62/4I. The proposed Agreement of Cooperation between IMO and IWC was approved, which means that the IWC now has definitive IMO observer status. While the impetus for closer co-operation between IMO and IWC was in relation to ship strikes on cetaceans, there are a number of other issues of potential mutual relevance including habitat degradation and noise from shipping. Discussions on

[1]See *http://www.iucn.org/wgwap/wgwap/public_statements/* for the text of this and other letters.

collisions with whales and underwater noise from shipping took place within the Marine Environment Protection Committee (MEPC) at its 59th session held in July 2009 and 60th session held in March 2010.

The MEPC has had 'noise from commercial shipping and its adverse impact on marine life' on its work programme since 2008. A correspondence group was established to identify and address ways to minimise the introduction of incidental noise into the marine environment from commercial shipping to reduce the potential adverse impact on marine life and in particular develop voluntary technical guidelines for ship-quieting technologies as well as potential navigation and operational practices. The IWC Secretariat is a member of this group.

The Committee thanked the IWC Secretariat for its report and **agrees** that it should represent the Committee at the next IMO meeting. Further information on IMO can be found at *http://www.imo.org.*

4.17 Other

An update was received on conservation in the Southeast Pacific under the framework of the Lima Convention and is given as IWC/62/4C. In January 2010 the 16th Meeting to the Parties to the Lima Convention was held in Guayaquil, Ecuador. The five member countries (Chile, Colombia, Ecuador, Panama and Chile) reviewed the activities regarding implementation of a Plan of Action for the Conservation of Marine Mammals in the Southeast Pacific (PAMM). The PAMM was formed to help countries to improve their policies on marine mammals' conservation and to develop activities that require regional cooperation.

In 2009 five pilot projects to mitigate the impacts of fishing activities were conducted: (1) implementation of actions for the conservation of the Chilean dolphin in the zone of Constitucion; (2) study to mitigate impact of the incidental entanglement of coastal cetaceans in the Columbia Pacific; (3) preliminary assessment of the interaction of cetaceans with artisanal fisheries in the Machalilla National Park, Ecuador; (4) reduction of the impact of gillnets on cetaceans in coastal waters within the Gulf of Chiriqui; and (5) study to test the use of pingers to reduce the incidental bycatch of small cetaceans in Peru.

As a result of these projects, a document entitled 'Efforts to mitigate the impact of fishing activities on cetaceans in the Southeast Pacific countries' will be published.

The first phase of a biodiversity and MCPA information system (SIBIMAP-PSE) was finalised. This is an online tool for searching and downloading information crucial for management and conservation of cetaceans, sea turtles and MCPA in the Southeast Pacific. The module on cetaceans is now complete.

A workshop on legal aspects of whalewatching was planned for March 2010, but was postponed until late 2010 due to an earthquake in Chile.

The Committee thanked Felix for his report and **agrees** that he should represent the Committee at future activities related to cetacean conservation in the Southeast Pacific under the framework of the Lima Convention.

5. REVISED MANAGEMENT PROCEDURE (RMP) – GENERAL ISSUES

5.1 Review MSY rates

5.1.1 Report of the intersessional workshop

The Committee has been discussing maximum sustainable yield rates (MSYR) for some time in the context of a general reconsideration of the plausible range to be used in population models used for testing the *Catch Limit Algorithm* (*CLA*) of the RMP (and see Item 5.1.2 below). At present, this range is 1% to 7% when expressed in terms of the mature component of the population. As part of the review process, information on observed population growth rates at low population sizes is being considered because Cooke (2007) noted that in circumstances where variability and/or temporal autocorrelation in the effects of environmental variability on population growth rates is high, simple use of such observed population growth rates could lead to incorrect inferences being drawn concerning the lower end of the range of plausible values for MSYR.

A Third Workshop was held intersessionally to examine whether the observed levels of variation in baleen whale reproduction and annual survival rate parameters were sufficiently large that biases of the nature identified from population models incorporating environmentally-induced variability might be of concern (SC/62/Rep2; Annex D, item 2.1.1).

At the Workshop, an analytical approach was developed and followed to estimate the coefficient of variation (CV) and temporal autocorrelation for the selected time series of calving proportion indices and calving interval data. This information, modified appropriately, provides input for a method developed to relate variability in calving proportion to variability in the annual growth rate of a population using a population dynamics model (see SC/62/Rep2). The model can take into account environmentally-induced variability in population abundance arising from variation in annual survival rate.

The Workshop identified two further steps needed before results from this model can be used to draw inferences about the plausible ranges for the CV and temporal autocorrelation parameters describing the effects of environmental variability on population dynamics in the model of Cooke (2007). The Committee incorporated these into its work plan under this item (see Annex D, item 2.1.2).

The Workshop received a revised approach for a meta-analysis of population growth rates previously discussed (IWC, 2010b) and suggested some additional work to be completed before the 2010 Annual Meeting. Item 5.1.2 and Annex D, item 2.1.1 describe progress made on three other issues listed in the work plan for completion of the MSYR review at last year's meeting.

5.1.2 Issues arising

The Committee received SC/62/RMP3 in response to the Workshop recommendations to: (1) apply the age-structured model of SC/62/Rep2, Annex D to all of the datasets assembled during the Workshop to estimate the resultant CV and temporal auto-correlation in growth rate; and (2) to conduct further tests of the Bayesian meta-analysis approach. More details are given in Annex D, item 2.1.2.

The Committee **agrees** that this Bayesian approach was an acceptable basis to compute a posterior distribution for r_0, once the inputs needed to apply it become available. It also **agrees** that account will need to be taken that the estimates of lower posterior percentiles from this method are positively biased, before making recommendations regarding appropriate values for MSYR for use in trials.

SC/62/RMP2 and SC/62/RMP4 responded to recommendations to use the environmental variability model of Cooke (2007) to provide CVs and temporal autocorrelation estimates for the growth of the population from one year to the next for the standard set of scenarios and to use this model to determine the predicted relationship between the length of series and the estimated level of variability in the population rate of increase. More details are given in Annex D, item 2.1.2. The Committee **agrees** that it now has a basis to link variability in demographic processes with the inputs of the Cooke (2007) model.

Efforts to fit models that account for both process and observation error to the data on calving rates and calving intervals had encountered numerical problems intersessionally The Committee **endorses** a work plan to address this (Annex D, Appendix 2) and looks forward to seeing the results of this work next year.

The Committee discussed how to relate variation in net recruitment rate, which depends on variation in both survival and reproduction, to variation in reproductive rates alone. Details are given in Annex D, item 2.1.2. The Committee considered the question of correlations between survival and reproductive rates to be potentially important for the question of estimating typical levels of variation in net recruitment rate for baleen whales, but **agrees** that more analysis is required before any general inference can be drawn. It **requests** in particular:

(1) a literature review with regard to the question of the circumstances under which correlations between survival and reproductive rates would be negative or positive;
(2) more extensive modelling to cover the full range of parameter values deemed to be plausible for baleen whales in order to determine whether general inferences can be drawn, or at least to identify the circumstances where substantial correlations of a specific sign would be expected;
(3) direct estimation of variability in survival rates to the extent that this is possible.

The Committee **agrees** that if results from this work are available at its next meeting, then they should be taken into account in its deliberations with respect to the level of variability in baleen whale demography. However, that lack of results will not preclude the Committee from completing its review of MSY rates next year.

The Committee considered the extent to which genetic data could place bounds on fluctuations in population size for some examples of trajectories arising for the environmental variation model of Cooke (2007). It recognised the potential of genetic methods to inform its deliberations on the plausible range of MSYR values, but **agrees** that these methods could not be used during the current review. However, it **recommends** that the number of haplotypes in whale populations, along with other population and demographic measures should be assembled since this might inform the current review. The Committee **encourages** completion of a compilation already initiated by Brownell.

The Committee also **agrees** that although the use of time-series of abundance estimates for species other than whales to make inferences regarding the extent of variation and the temporal auto-correlation of the rate of growth remained a good idea, the lack of such time-series at present means that this source of information cannot be pursued during the current review.

In conclusion, although considerable progress was made during the current meeting, the Committee was once again not in position to complete the review. It established a work plan (see Annex D, item 2.5) to address the final issues that need to be examined to complete the review at next year's meeting.

It **agrees** that the review will be completed at next year's meeting on the basis of the data and analyses available. It **accepts** that it is not appropriate to keep extending the time available for the review, particularly given its importance to Item 5.2 below.

5.2 Finalise the approach for evaluating proposed amendments to the *CLA*

The Committee noted that it could not complete discussions on amendments to the *CLA* until the range for MSYR values in the RMP was completed. Regarding the Norwegian proposal for amending the *CLA*, it was noted that all of the relevant trials/results had been presented in Aldrin and Huseby (2007), but that evaluation of this proposal could not occur until the review of MSY rates was complete.

5.3 Version of *CLA* to be used in trials

SC/62/RMP10 examined the sensitivity of catch limits to the level of accuracy when computing posterior distributions using the *CLA*. Four versions of programs used to implement the *CLA* were discussed. More details are given in Annex D, item 2.1.2.

The Committee **endorses** the recommendations in SC/62/RMP10 that: (a) only the Norwegian version of the *CLA* should be used when conducting future trials; (b) the Second Intersessional Workshop in an *Implementation* or *Implementation Review* will need to be carefully scheduled to ensure that all trials can be run before it takes place; (c) if special circumstances arise when it becomes necessary to run additional trials during a meeting (e.g. during the Second Intersessional Workshop), the 'intermediate' version of the Cooke implementation that is more accurate than the 'trials' version (but less accurate than the 'accurate' or Norwegian version) be used for this purpose and the results confirmed using the Norwegian 'CatchLimit' program after the meeting; and (d) a full set of revised results from the trials for North Atlantic fin whales, Western North Pacific Bryde's whales; and North Atlantic minke whales should be run using the Norwegian 'CatchLimit' program and the results placed on the IWC website.

5.4 Updates to RMP specification and annotations

In the context of applying the RMP pursuant to Item 20, the Committee identified some issues where updating and clarification of the specifications of the RMP and the accompanying annotations and guidelines was warranted (see Annex D, item 2.4).

(1) The provision for the adjustment for sources of human-caused mortality other than commercial catches, as recommended by the Scientific Committee in 2000 (IWC, 2001f, p.91), should be included in the RMP with the qualification specified by the Commission (IWC, 2001b) that the provision be limited to mortality due to bycatches, ship strikes, non-IWC whaling, scientific permit catches, and indigenous subsistence whaling. A new annotation should be added to provide the Committee with operational guidelines to implement this provision.
(2) The maximum period of validity of catch limit calculations should be extended from five to six years to be consistent with the six-year cycle of surveying specified in section 3.2.2 of the RMP, as currently implemented for minke whales in the North Atlantic.
(3) The rule for rounding of catch limits to a whole number of whales should be clarified.

(4) The guidelines for conducting surveys under the RMP and those for *Implementing* the RMP (IWC, 2005b; 2005c) should be modified to clarify that changes to the guidelines are not retroactive. That is, results from surveys conducted in accordance with earlier version of the guidelines would not become inadmissible for use in the RMP when the guidelines are changed.

Proposed amendments to the RMP and its annotations to address these issues are given in Annex D, Appendix 5, along with some background information. The Committee **recommends** adoption of these amendments to the RMP specification and annotations. The Committee further **requests** the Secretariat to prepare a proposal to next year's meeting to update the guidelines for conducting surveys and for *Implementations* to accommodate point (4) in Annex D, item 2.4.

Several amendments to the RMP specifications and annotations had been adopted since the most recent published version (IWC, 1999e). These are listed in Annex D, Appendix 5. The Committee **agrees** that the consolidated revised version be published in full in the next supplement to *J. Cetacean Res. Manage.*

6. RMP – *IMPLEMENTATIONS* AND *IMPLEMENTATION REVIEWS*

6.1 Western North Pacific Bryde's whales

6.1.1 Complete Implementation

6.1.1.1 RESEARCH PROPOSAL FOR THE 'VARIANT WITH RESEARCH'

The Committee had agreed in 2007 (IWC, 2008b) that three of the four RMP variants (1, 3 and 4) considered during the *Implementation* for western North Pacific Bryde's whales performed acceptably from a conservation perspective and recommended that those variants could be implemented without a research programme. It also agreed that variant 2 was only 'acceptable with research' because conservation performance was 'unacceptable' on three 'medium' plausibility trials incorporating stock structure hypothesis 4 i.e. two stocks of Bryde's whales in the western North Pacific, one of which consists of two sub-stocks (stock structure hypothesis 4).

In 2008, the Committee reviewed a research proposal (Pastene *et al.*, 2008) that aimed to determine whether or not sub-stocks occur in sub-area 1. Based on this review, the Committee had recommended that the *Implementation Simulation Trials* for the western North Pacific Bryde's whales be used to determine whether differences in age-compositions between sub-areas 1W and 1E could be used to resolve whether there are sub-stocks in these sub-areas and that results from previous (and any new) power analyses that assess the use of genetic methods to evaluate stock structure hypothesis 4 be included in the revised proposal.

This year, the Committee received a revised research plan (Annex D, Appendix 6) and welcomed work done to address several of its earlier recommendations. The results of the *Implementation Simulation Trials* showed that recent age structure data would not be able to distinguish between scenarios in which there is or is not age-structuring in sub-areas 1W and 1E.

The Committee **recommends** that the proposal be revised further and, in particular, that the power analyses focus more clearly on the specific hypotheses for the Western North Pacific Bryde's whales. The Committee was informed that a revised proposal will be presented next year that will focus to a greater extent on the use of genetic data.

6.1.2 Recommendations and work plan

The Committee **agrees** that its work plan for the 2011 Annual Meeting would be to review the revised research proposal for the 'variant with research'.

6.2 North Atlantic fin whales

6.2.1 Complete Implementation

Last year, the Committee had agreed that if the RMP is implemented for this species in this Region, variants 1, 3, 4, 5 and 6 (see Table 4 of IWC, 2010d) can be implemented without an associated research programme but that variant 2 (sub-areas WI+EG are a Small Area) was only acceptable with research.

This year, comparison of results from different versions of the *CLA* (see Item 5.2) revealed that variant 3 (sub-areas WI+WG+EI/F are a *Small Area*) does not have 'acceptable' performance for some of the trials and can no longer be considered to be acceptable without research but is rather only 'acceptable with research'.

Last year, the Committee had confirmed that use of variant 2 for ten years followed by variant 1 (sub-area WI is a *Small Area*) led to performance which was 'acceptable' for all trials and consequently that the requirements for stage 1 of the process for implementing a 'variant with research' had been met. The second stage of the process was for Iceland to demonstrate to the satisfaction of the Committee that a research programme has a good chance (within a 10-year period) of being able to confirm or deny that stock structure hypothesis IV is implausible.

The Committee received a research proposal (SC/62/RMP1) that followed the *pro forma* agreed by the Committee in 2007. Details are given in Annex D, item 3.2.2.

The Committee welcomed the proposal, noting that it was not final and that Iceland was inviting suggestions for how it can be improved. In discussion, it noted that the aim of the proposal should be to assess the probability of hypothesis IV relative to the probabilities for the other stock structure hypotheses. It noted that the *Implementation Simulation Trials* could be used to assess the effect sizes on which the power analyses are based.

In particular, the Committee **recommends** that the lowest rate at which the C sub-stocks mix in sub-areas EC, WG, EG, WI, EI+F, and N and the performance of variant 2 is 'acceptable' for all trials should be calculated and used when conducting power analyses. It further **recommends** that quantitative analyses along the lines of Appendix 3 of SC/62/RMP1 be conducted for each of the stock structure hypotheses.

6.2.2 Recommendations and work plan

The Committee **agrees** that its work plan for the 2011 Annual Meeting would be to review a revised research proposal for the 'variant with research' and to review any abundance estimates for use in the *CLA*.

6.3 North Pacific common minke whales

6.3.1 Initiate pre-Implementation assessment

In 2009, the Commission had agreed that the Scientific Committee should follow the option in its report (IWC, 2010e) that specified completing a full *Implementation Review* as soon as possible, ideally by the 2012 meeting. This timeline will be possible only if the *pre-Implementation assessment* can be completed this year. The Committee was undertaking a *pre-implementation assessment*, rather than immediately commencing an *Implementation Review*, because the 2003 *Implementation* had been conducted before the existing guidelines for *Implementations* had been developed and had focused primarily on 'O' stock.

Committee guidelines for *Implementations* (IWC, 2005b) state that the main focus of a *pre-Implementation assessment* is:

> 'the establishment of plausible stock hypotheses consistent with the data that are inclusive enough that it is deemed unlikely that the collection of new data during the *Implementation* process will suggest a major novel hypothesis (e.g. a different number of stocks) not already specified in the basic *Implementation Simulation Trial* structure.'

Additional foci are examination of available abundance estimates and information on the geographical and temporal nature of 'likely' whaling operations and future levels of anthropogenic removals other than due to commercial whaling.

The importance of creating a document that lists the various datasets and other information available for the *pre-implementation assessment* was recognised (this is normally provided by national scientists in the case of a new request for a *pre-Implementation assessment)*. This will be a living document, at least until the deadline is established for the consideration of no new data for the *Implementation Review* (this occurs at the First Intersessional Workshop although new *analyses* may be presented at the First Annual Meeting). A table containing this information is given in Annex D1, Appendix 2.

6.3.1.1 STOCK STRUCTURE

The goals for the *pre-Implementation assessment* with respect to stock structure were to agree to a set of inclusive plausible hypotheses consistent with the data, and to ensure that the types of information needed for the *Implementation Review* were available. Assessing the relative plausibility of alternative hypotheses regarding stock structure will be considered at the First Annual Meeting of the *Implementation Review*.

The Committee briefly discussed minimum standards for plausibility. It **agrees**, as it has in the past, that the most reasonable approach is to use best professional judgment and common sense, after considering all relevant information.

The Committee first reviewed past discussions on stock structure for western North Pacific minke whales. Details are given in Annex D1, item 5.1.

The Committee then received a number of papers providing new information relevant to stock structure. Details of these and the considerable discussions that ensued are given in Annex D1, item 5.3. The following summary focuses on issues where the Committee made specific statements.

SC/62/NMP22 provided results of a biopsy skin-sampling survey in July-August 2009 in the Okhotsk Sea. Unfortunately, none of the five biopsy samples taken could be removed from Russian waters because of CITES-related restrictions. This is discussed further under Annex D1, item 7.6. In spite of this, the Committee was pleased that that this research had been conducted within the Russian EEZ, and that it had been possible to collect biopsy samples from minke whales on the feeding grounds. The Committee **encourages** future collaborations and **strongly urges** all concerned to find ways to solve these CITES-related issues.

SC/62/NPM10 estimated the mixing proportion of 'O' and 'J' stocks in the Sea of Okhotsk using cookie-cutter shark scars from 22 animals. Based on previous research in sub-area 11 in 1996 and 1999, the maximum likelihood estimate for the proportion of 'J' stock in sub-area 12 was 0. The Committee welcomed this valuable new information, but **agrees** that the method used to estimate mixing proportions needed some refinement.

SC/62/NPM13 reviewed non-genetic biological information relevant to the stock structure of minke whales in the Yellow Sea, Sea of Japan (East Sea), and western Pacific Ocean. The review was structured to examine four key comparisons between: (1) the Yellow Sea and the Korean coast of the Sea of Japan; (2) the Korean and Japanese coasts in the Sea of Japan; (3) the Sea of Japan and Pacific coasts of Japan; and (4) coastal and offshore areas of the Pacific Ocean. The Committee welcomed this attempt to synthesise diverse types of non-genetic information that potentially can inform discussions of stock structure and found the idea of orienting the analyses around four key questions useful. The authors acknowledged that although they had attempted to be exhaustive, they might have missed some relevant biological information, particularly if it was reported outside the IWC context, and requested that any such information be forwarded to them. The Committee in particular supported the collation of information in table 3 in SC/62/NPM13 and **encourages** members to work together to complete this and provide it to the First Intersessional Meeting of the *Implementation Review*.

The Committee reconsidered Hatanaka and Miyashita (1997) that investigated feeding migration based on length data. It was pointed out that these data are consistent with the generic concept of an 'O' stock, and that the length data might be useful for mature/immature determinations to condition different migration patterns for one or more 'O' stocks. The Committee **agrees** to include these data in Annex D1, Appendix 2.

SC/62/NPM11 had two major objectives: (1) to determine the status of whales that could not be identified reliably to 'O' or 'J' stock based on analyses described in Kanda *et al.* (2009); and (2) to examine stock structure of the 'J' stock in the Sea of Japan and Yellow Sea. The Committee **appreciates** the efforts of the authors to respond to some of the suggestions for additional analyses made last year.

Two papers presented new analyses of mtDNA data. SC/62/NPM21 examined genetic variation at the mtDNA control region to evaluate the plausibility of proposed stock structure scenarios for the 'J' and 'O' stocks. SC/62/NPM20 reported on differences in mtDNA sequences and sex ratios in western North Pacific minke whales by combining information from samples collected in Korean market surveys with three Japanese datasets made available through the IWC Data Availability Agreement. SC/62/NPM27 commented on the analyses conducted in SC/62/NPM20. In discussion, it was clarified that although SC/62/NPM20 and SC/62/NPM27 largely considered the same group of samples, there were two important differences: (1) SC/62/NPM20 used market samples for Korean samples, while SC/62/NPM21 used bycatch; and (2) SC/62/NPM21 used mtDNA data that had been error-corrected subsequently whereas due to time constraints and the agreed deadlines for *pre-Implementation assessment*. SC/62/NPM20 used the original data and grouped haplotypes into haplogroups to minimize influence of the sequencing errors.

In further discussion of standards for establishing/rejecting hypotheses, the Committee **agrees** that it is important but challenging to try to find a balance between two potential errors: (1) interpreting minor differences that might be artefacts or not biologically meaningful as evidence for separate stocks; and (2) failing to recognise true stock structure because power to resolve closely related populations is low.

Discussion of these issues highlighted divergent opinions within the Committee regarding how best to deal with the inability to sample populations on their breeding grounds. In one view, the best way to approach this problem is to use results of the program *STRUCTURE* (Pritchard *et al.*, 2000) which is designed to deal with situations in which there are no reliable *a priori* ways of grouping individuals into putative populations. The other view was that this approach has elements of circularity and can result in a false sense of confidence in model results and that *STRUCTURE* has a documented inability to provide reliable results when dealing with mixtures of closely related populations. These issues have arisen previously regarding earlier versions of the genetic data analyses for North Pacific minke whales (IWC, 2010e).

The Committee **agrees** on the potential value of trying to collect samples in areas where a single stock is believed to occur, but recognises the difficulty in identifying the location of these.

Following presentation and discussion of new information, the Committee reviewed and discussed two independent attempts to generate plausible stock-structure hypotheses that synthesised both genetic and non-genetic information. The summaries of these papers and the ensuing discussion are below.

SC/62/NPM12 examined recent progress in the development of stock structure hypotheses for western North Pacific common minke whale ('O' and 'J' stocks), and conducted a preliminary evaluation of these hypotheses in the context of the available scientific information, mainly genetics, presented and discussed by the Committee in recent years. The aim was to identify stock structure scenarios that are consistent with the data. The authors of SC/62/NPM12 considered that the best available scientific evidence is consistent with the hypothesis that there is a single 'J' stock distributed in the Yellow Sea, Sea of Japan and Pacific side of Japan and a single 'O' stock in sub-areas 7, 8 and 9. They considered this hypothesis the most plausible. It is consistent with the pattern of mixing between 'J' and 'O' stocks along the Japanese coast as proposed by Kanda *et al.* (2009), the migration patterns of adult and juvenile 'J' stock whales as suggested by SC/62/NPM1, and the migration of 'O' stock whales as suggested by Hatanaka and Miyashita (1997). SC/62/NPM12 postulated three less plausible hypotheses which modify the most plausible scenario as follows:

(1) a W-stock sporadically intrudes into sub-area 9;
(2) a different stock (Y-stock) resides in the Yellow Sea and overlaps with 'J' stock in the southern part of sub-area 6; and
(3) a W-stock sporadically intrudes into sub-area 9 and a Y-stock resides in the Yellow Sea, and overlaps with 'J' stock in the southern part of sub-area 6.

These four hypotheses are further described and shown graphically in Annex D1, Appendix 3.

SC/62/NPM15 reviewed genetic and non-genetic data regarding stock structure; the authors summarised their conclusions in the context of addressing four key questions, as follows.

(1) Are whales in the Yellow Sea part of a population that migrates into the Sea of Japan?
SC/62/NPM15 summarised that migration north into the Yellow Sea, the presence of mature whales and cow/calf pairs there, and the fact that Yellow Sea whales have only autumn conception dates (*n*=124), provides evidence that a separate stock exists there. The Korean coast of the Sea of Japan showed some evidence for a mixture of two stocks, and microsatellite DNA showed seasonal differences that might be explained by a Yellow Sea stock moving along the Korean coast only in summer. In summary, the authors consider that the available data suggest that Yellow Sea whales may not be a part of the Sea of Japan stock.

(2) Are whales along the Korean coast part of the same population as whales along the western Japanese coast?
SC/62/NPM15 summarized that there is no obvious hiatus in distribution between the two coasts, and that genetic analyses showed mixed results (haplogroup and *STRUCTURE* found no difference, pair-wise mtDNA and microsatellite DNA found differences). A small sample (*n*=8) from the Sea of Japan showed a bimodal distribution of conception dates and a larger sample (*n*=63) showed two different flipper colour patterns, but these data could be explained by a mixture of whales coming into the northeast Sea of Japan from the Sea of Okhotsk. No sex bias or haplogroup-by-sex differences were found for Japanese Sea of Japan bycatch, suggesting a possible year-round presence of a non-migratory coastal stock. In summary, the authors consider that it is plausible there are different stocks on either side of the Sea of Japan, but the data are somewhat contradictory or are lacking in sufficient resolution or spatial extent to make definitive conclusions. Some genetic evidence suggesting a second stock could be most simply explained by whales from a Yellow Sea stock appearing along the coast of Korea in summer.

(3) Are so-called 'J-type' whales on the east coast of Japan the same population as on the west coast of Japan?
The majority of whales bycaught on the southern Pacific coast of Japan (sub-area 2) are assigned to be J-type and so are either part of a Sea of Japan stock or are a coastal stock separate from a Pacific Ocean ('O') stock. Whales caught in the Pacific Ocean, even from sub-area 7 coastal areas, only have winter conception dates (*n*=68) and a single flipper colour type (*n*=77); if coastal sub-area 7 had a mixture of stocks there should be autumn conception dates and a mixture of flipper colour types. There are differences in microsatellite DNA and mtDNA between the two coasts of Japan when all samples are used. Additionally, the southern Pacific coast bycatch (sub-area 2) is genetically different from bycatch along the northern Pacific coast of Japan (sub-area 7), suggesting a Pacific coastal stock might be distributed only in the Kuroshio current, and does not occur further north in the Oyashio current. In summary, the authors consider that it is plausible that there are different coastal stocks on either coast of Japan, and/or longitudinally along the Pacific coast.

(4) Is there a coastal population in Subarea 7 (east of Hokkaido and northern Honshu) that is different from offshore minke whales in the Pacific Ocean, even after accounting for Sea of Japan whales that might migrate into this area?
One hypothesis is that there is a 'pure' Sea of Japan stock (J-type whales) and Pacific Ocean stock (O-type whales). Under that hypothesis, genetic differences between Pacific coastal waters (sub-area 7W) and other areas have been interpreted to be a mixture of these two stocks. An alternate hypothesis is that this area contains a distinct stock characterised by intermediate haplotype frequencies, as seen in humpback whales, for example. Again, the lack of evidence of autumn conception dates (*n*=68) and a mixture of flipper colour types (*n*=77) in the Pacific Ocean argues

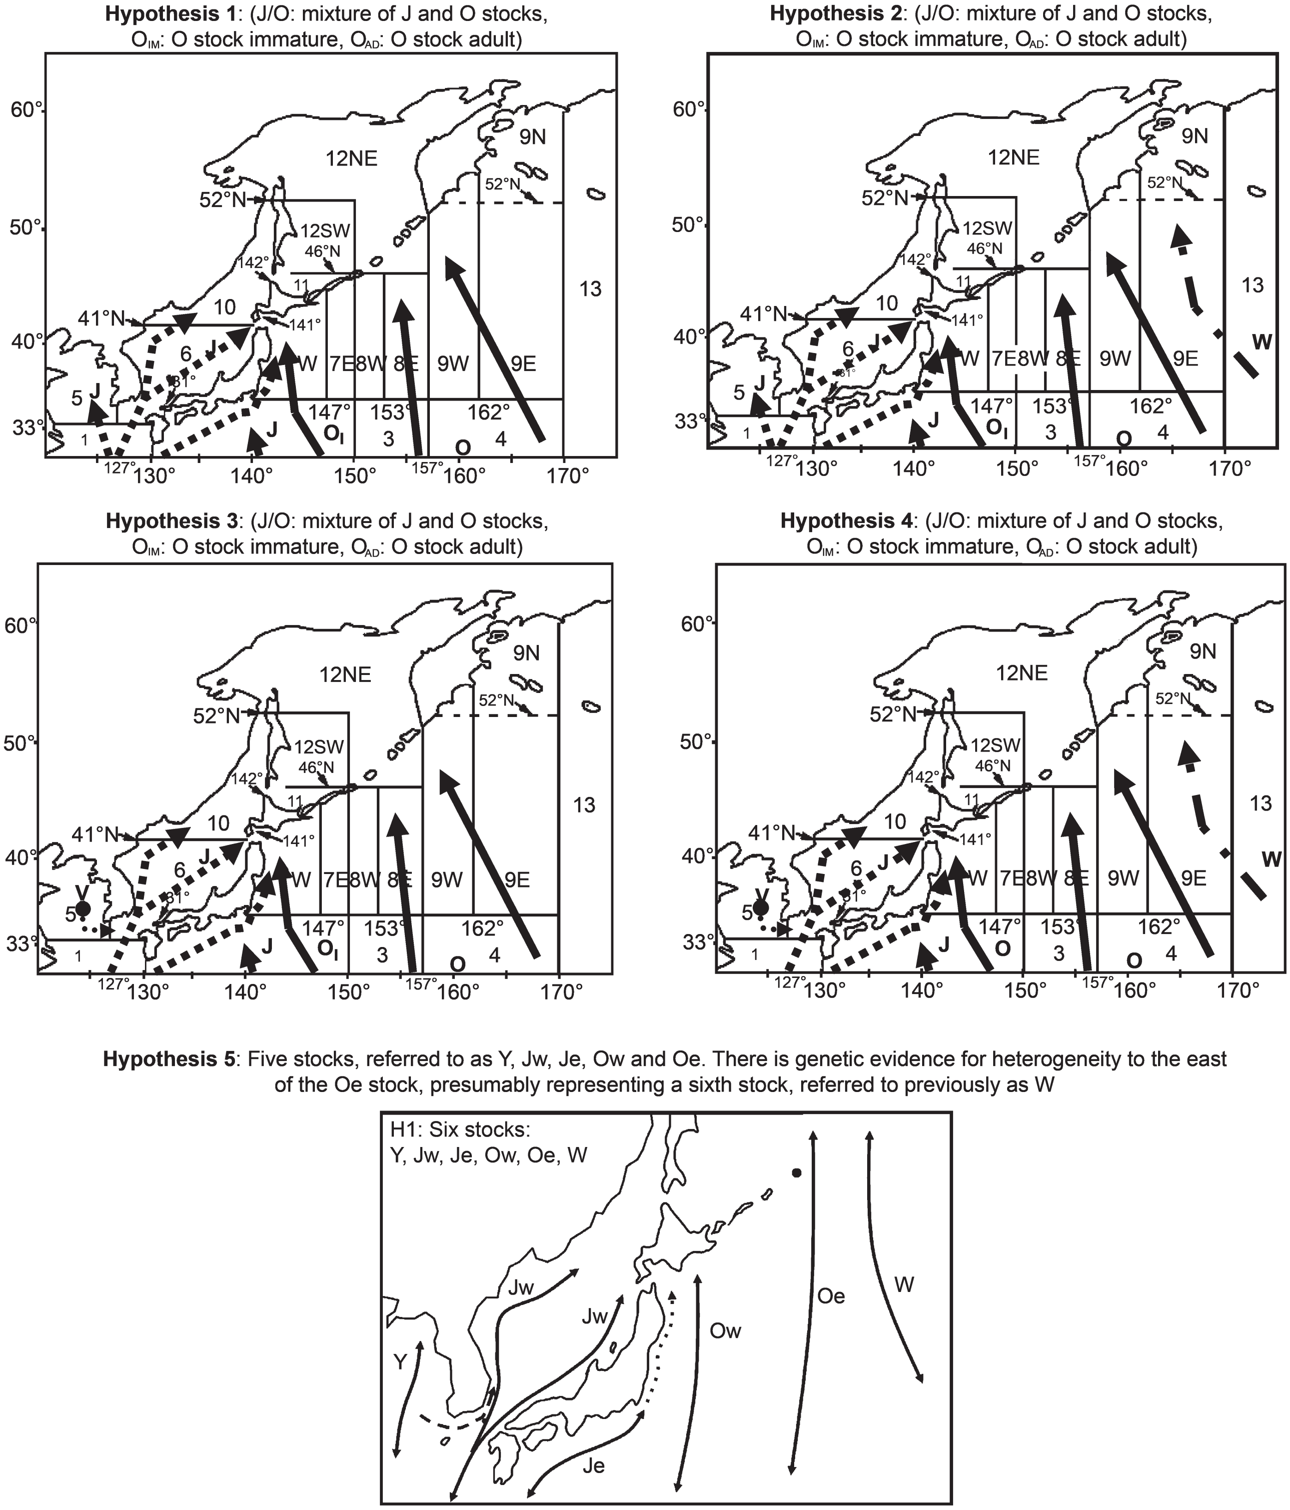

Fig.1. Five plausible stock structure hypotheses for North Pacific minke whales.

against there being a mixture of stocks in coastal Pacific areas. Although it is possible that the haplotype frequencies of sub-area 7W could be explained by a complex seasonal, sex- and age-biased mixing of 2 stocks, e.g. a 'core J' and a 'core O', it is not as parsimonious as the hypothesis of a distinct stock with intermediate haplogroup frequencies. The absence of a strong haplogroup-by-sex interaction in coastal waters is inconsistent with the prediction of a sex-biased mixing of two stocks. SC/62/NPM30 concluded that there was genetic heterogeneity in the Pacific Ocean, with a strong signal in the coastal area east of Hokkaido. In summary, the authors consider that it is plausible that the unique genetic signals seen in coastal waters of the Pacific coast of Japan are due to the existence of a distinct coastal stock or stocks, rather than a mixture of a 'pure J' and a 'pure O' stock.

An additional stock-structure hypothesis based on consideration of the four questions posed above is that there are six stocks (Y, J_W, J_E, O_W, O_E, and W); this is described and shown graphically in Annex D1, Appendix 4.

In discussion, there was general agreement on answers to two of the key questions posed by SC/62/NPM15: (1) a separate J-like stock (denoted Y-stock) occurs in the Yellow

Sea and in at least some years some Y-stock whales are found in the Sea of Japan; and (2) minke whales on the east coast of Korea and on the west coast of Japan are generally part of a single stock.

In contrast, substantial disagreements remained concerning the other two questions. These disagreements centred on how to interpret results of statistical tests showing heterogeneity of allele frequencies. In one view, the results can be explained by overlapping distributions of 'O' and 'J' stock, which leads to different mixing proportions (and hence different allele and haplotypic frequencies) in different geographic areas. Under this hypothesis, it would not be surprising that comparisons of samples from areas having different fractions of the two stocks often produce statistically significant results. An alternative view to an explanation that requires complex mixing patterns is the hypothesis that the statistically significant differences reflect a distinct stock with intermediate gene frequencies.

In conclusion, in spite of the disagreements noted above, the Committee **agrees** that the set of stock-structure hypotheses based on the four proposed in Annex D1, Appendix 3 and the fifth proposed in Annex D1, Appendix 4 were inclusive and sufficiently plausible at least to take forward to the next step in the *Implementation* process (see Fig. 1).

6.3.1.2 CATCHES

The Committee noted that information was available on commercial catches for those countries that have taken the largest catches of western North Pacific minke whales. There are, however, limited data on catches for the People's Republic of China and no catch data for North Korea (if North Korea has taken western North Pacific minke whales).

The Committee reviewed information regarding incidental catches.

SC/62/NPM4 provided information on incidental catches of common minke whales off Japan and Korea. Some suggestions were made on how plausible estimates of future incidental catches can be made, as well as to how past series, now considered erroneous, can be constructed. The Committee noted that it would be useful if estimates were presented to the Preparatory Meeting for the First Intersessional Meeting of the *Implementation Review* (see Item 6.3.2 and Annex D1, item 11.2).

SC/62/NPM19 provided information on bycatch of minke whales in Korean waters from 1996 to 2008. The authors collected bycatch data from the 14 local branch offices of the Korea Coast Guard which investigates the bycatch of cetaceans. A total of 1,156 minke whales were bycaught of which 83.7% were bycaught in the East Sea; 363 animals were entangled or trapped by set nets, 316 and 303 were entangled by fish pots and gillnets, respectively.

SC/62/NPM26 provided information on incidental catches off Korea based on DNA profiling of market products (discussed under Annex J, item 9.4), which suggested that reported bycatch totals may be underestimated. The Committee was informed that the large majority of the incidental catch off Japan was taken in set nets; 119 common minke whales were bycaught in set nets and one animal in a gill net during 2009 (SC/62/ProgRepJapan).

The Committee **recommends** that available data on incidental catches and the associated effort should be analysed to develop CPUE series for possible use during the *Implementation Review*. The Committee **agrees** that sufficient information is available that alternative hypotheses regarding time-series of historical commercial and incidental catches can be developed during the *Implementation Review*. The Committee **agrees** that during the *Implementation Review* there is sufficient information to disaggregate the historical commercial and incidental catches to sub-areas and periods during the year.

The Committee received information on likely future whaling operations for minke whales in the western North Pacific. Japan aims to conduct land-based and pelagic whaling. Land-based whaling will be restricted to close to Japan while pelagic whaling will occur mainly in offshore areas. Temporal and spatial restrictions will be imposed on both types of whaling to try to reduce catching J-type animals. Korea intends to conduct land-based whaling to the east and west of Korea from March to November. These whaling plans will need to be elaborated further during the First Intersessional Workshop of the *Implementation Review*.

The work related to catches that needs to be completed prior to the Preparatory Meeting for the First Intersessional Workshop of the *Implementation Review* is:

(1) construction and GLM standardisation of CPUE series using the incidental catches and the associated fishing effort (see also Annex D1, item 8.3);
(2) development of a format for reporting incidental catches by Japanese and Korean scientists to the Secretariat and the provision of these data in the agreed format to the Secretariat; and
(3) development of alternative hypotheses regarding time-series of past and future commercial and incidental catches.

6.3.1.3 ABUNDANCE ESTIMATES

The Committee reviewed information available on abundance surveys and estimates of abundance.

SC/62/NPM2 provided estimates of abundance for the JARPN II survey area (sub-areas 7, 8 and 9, excluding the Russian EEZ) for the early (May and June) and late (July and August) seasons for 2006 and 2007. SC/62/NPM16 analyzed sightings data from recent surveys conducted by Korea in the Yellow Sea (sub-area 5) and the East Sea (sub-area 6) to estimate the abundance of common minke whales. Details are given in Annex D1, item 7.1.

SC/62/NPM24 reported on a sighting survey for minke whales and other cetaceans in the East Sea from 21 April to 30 May, 2009. An provided oversight on behalf of the Scientific Committee and the survey was undertaken in accordance with IWC guidelines. The plan had been presented to the 2008 Annual Meeting (Choi *et al.*, 2008) and was endorsed by the Committee. Details are given in Annex D1, item 7.1. The Committee expressed its appreciation to the Government of Korea for its continued commitment to surveys for minke whales in Korean waters, and to An for his role of oversight on behalf of the Committee. The Committee **agrees** that data from the 2009 survey off Korea are suitable for use in the RMP.

SC/62/NPM7 summarised the sighting surveys for minke whales in the western North Pacific conducted by Japan and Korea since 2000. The survey period for 'J' stock was April-June, and that for 'O' stock July-September. The areas covered were the Korean EEZ in sub-areas 5 and 6, the Japanese EEZ in sub-areas 6 and 10, the Russian EEZ in sub-area 10, the Sea of Okhotsk (sub-areas 11 and 12) and east of the Kurile archipelago and Kamchatka (sub-areas 8, 9 and 12), including the Russian EEZ. A total of 505 minke whale schools (560 animals) were sighted on 27,045 n.miles on primary search effort in 22 cruises.

SC/62/NPM8 updated the integrated abundance estimates for minke whales in sub-areas 5, 6 and 10 using new information on abundance and *g*(0). SC/62/NPM14 reviewed the proposed method in SC/62/NPM8 for integrating surveys for use in the *Implementation Simulation Trials*. Details are given in Annex D1, items 7.1 and 7.3.

The Committee **endorses** the method used to combine sightings data over time to estimate the extent of additional variance, but not necessarily the methods proposed for dealing with abundance across spatial areas in this case because of concerns over migration during the survey and extrapolation (see also Annex D1, item 7.3). The Committee did not review the abundance estimates in SC/62/NPM8 *inter alia* because it is unclear whether the sub-areas used for reporting abundance estimates will be used in the *Implementation Simulation Trials* developed during the First Intersessional Meeting. It was noted that although models can be used to interpolate abundance for unsurveyed regions, if a region has never been surveyed, the abundance estimate for that region should be set to zero when calculating catch limits under the RMP.

The Committee discussed possible migration patterns of 'J' stock minke whales in the Sea of Japan, as well as whether some component of the 'J' stock may not migrate to a substantial extent, in relation to how abundance estimates are computed and used in *Implementation Simulation Trials* and when applying the *CLA*. The Committee **agrees** that care needs to be taken to avoid double-counting animals when computing abundance estimates. In relation to animals in the Sea of Japan and the Yellow Sea, the Committee **agrees** that the *Implementation Simulation Trials* will capture hypotheses regarding the migration patterns of western North Pacific minke whales and that the models underlying these trials would be specified accordingly. The abundance estimates used for conditioning will be allocated to the appropriate time periods to avoid double counting.

The Committee **agrees** that there are several abundance estimates available for possible use when conditioning trials. Annex D1, table 1 provides a summary of the sightings surveys for the sub-areas used in the last set of *Implementation Simulation Trials* and those conducted since. The Committee did not discuss the acceptability or otherwise of the use of these surveys for conditioning the *Implementation Simulations Trials*.

The Committee noted that it was not necessary to select the abundance estimates for use in the *CLA* at the present meeting; this will take place during the First Intersessional Meeting of the *Implementation Review*. The selection of abundance estimates for use in *CLA* will need to take account of whether or not the surveys and their analysis followed the Requirements and Guidelines for Conducting Surveys and Analysing Data within the RMP (IWC, 2005c). Some of these surveys (e.g. those from JARPN II) have not been reviewed by the Committee for use in the RMP.

SC/62/NPM9 provided revised estimates of *g*(0) and abundance for western North Pacific common minke whales. The main changes from the previous analyses were the addition of new data, particularly for the Okhotsk Sea for 2003 and 2005. Details are given in Annex D1, item 7.5. The Committee welcomed this analysis which substantially reduced the previous range for *g*(0) but there was insufficient time for an in-depth review. The Committee **agrees** to review the method used to estimate *g*(0) and the resultant estimates further at the First Intersessional Workshop.

The Committee received information on plans for future sighting surveys by Korea and Japan (SC/62/NPM17 and SC/62/NPM4). Japan noted that it was not currently planning to conduct surveys in sub-areas 6 and 10, but may revise that decision in future. It was noted that the results of the *Implementation Simulation Trials* may provide information on which programme of surveys will lead to the best performance of the RMP, and that Japan and Korea may wish to modify their survey plans once the results of initial trials become available.

More specifically, SC/62/NPM25 described plans for a sighting survey in the Yellow Sea in April-May 2011, with the objective to obtain information on the distribution and abundance of minke whales. Details are given in Annex D1, item 7.6. The Committee was pleased to see that distance and angle estimation will be tested and **requests** that the results of analyses of these and previous data be presented to future meetings. It was noted that the survey could be conducted to eliminate the possible implications of migration during the survey. The Committee appointed An to provide oversight on behalf of the Committee.

SC/62/NPM23 described plans for a sighting and biopsy sampling survey for common minke whales in the Okhotsk Sea during summer 2010. The aim of the survey is to collect sightings data for abundance estimation and information on stock identification. To overcome CITES-related issues, genetic analysis using biopsied skin samples will be conducted on the research vessel. The Committee noted the importance of estimating the proportion of 'J' and 'O' stock animals in the survey area. It **recommends** that Japan explore ways that are not constrained by CITES to facilitate extracting relevant information from biopsy samples collected from the EEZ of Russia which could be used to examine stock structure and mixing. Specific suggestions for this are given in Annex D1, item 7.6. The Committee appointed Miyashita to provide oversight on behalf of the Committee.

6.3.1.4 OTHER ISSUES

Regarding information for estimating dispersal rates and mixing proportions, the Committee noted that SC/62/O30 outlined an approach for estimating mixing rates between stocks using microsatellite data.

Values for the biological parameters for use in *Implementation Simulation Trials* for the western North Pacific common minke whales had been assembled for the previous *Implementation* (IWC, 2004).

The previous trials were based on values for MSYR(mat) of 1% and 4%. These values should be used in any new trials unless the current review of MSY rates (Annex D, item 2) leads to a recommendation for a change to this range.

The Committee noted that CPUE data had been assembled and used to compare alternative stock structure hypotheses (Yasunaga *et al.*, 2009, Appendix II). It **recommends** that relevant commercial and incidental catch and effort data, along with the information identified by the 1987 CPUE Workshop (IWC, 1989), should be assembled, GLM standardised where possible, and be available at the First Intersessional Workshop of the *Implementation Review*. Data on flipper colour and conception dates should also be assembled and presented to the Preparatory Meeting of the First Intersessional Workshop of the *Implementation Review*. Initial discussions of future experimental and analytical ways to distinguish among competing hypotheses are given in Annex D1, item 10.

6.3.2 Recommendations

The Committee **agrees** that it has successfully addressed all of the items required for a *pre-Implementation assessment* and therefore **agrees** that the *pre-Implementation assessment* is completed.

The Committee **recognises** that there is a considerable amount of work that needs to be done to complete the *Implementation Review*. Specifically, there is a need: (a) to assemble the data so that they can be used when conditioning the operating models on which the *Implementation Simulation Trials* are based; (b) to specify and code the operating models themselves; and (c) to fit the operating models to the agreed data sets (conditioning).

The Committee **agrees** that it is infeasible to conduct all of the work in a single meeting (the First Intersessional Meeting). Rather, it **agrees** that the probability of completing the work during the first year of the *Implementation Review* will be maximised if two meetings occur. The main objective of the first (the Preparatory Meeting) would be to determine the structure (time-steps, sub-areas and population components) of the operating models so that all relevant data can be assembled at the appropriate spatial and temporal resolutions in time for the First Intersessional Workshop, and to start to specify the operating models and how they will be conditioned. The second step would be to complete work scheduled at the First Intersessional Workshop.

Annex D1, Appendix 9 outlines the work plan in more detail, including tentative dates for deadlines and holding the Preparatory Meeting and the First Intersessional Workshop.

6.4 North Atlantic common minke whales

6.4.1 New information on stock boundaries and abundance estimates

Some of the *Small Areas* boundaries for North Atlantic minke whales were changed during the 2003 *Implementation Review* but not all boundaries were fully specified. The Committee **recommends** that a point at 63°N, 12°W be introduced to fill the 'hole' between the CM and CIP *Small Area*, and that boundaries around the southern tip of Greenland be defined as shown in Annex D, fig. 1. It also **recommends** that the *Small Areas* in Annex D, fig. 1 be adopted for use when the applying the RMP for North Atlantic minke whales.

SC/62/RMP6 presented a method for estimating *g*(0) from single platform line transect data in which both the forward and perpendicular distances have been recorded. More details are given in Annex D, item 3.3.2. The Committee noted that attempts had been made in the past to estimate *g*(0) using data from a single platform. It **encourages** efforts to develop methods to achieve this. The Committee **recommends** that the robustness of the method proposed in SC/62/RMP6 to model structure uncertainty, measurement error, and diving pattern be examined.

SC/62/RMP7 summarised a sightings survey conducted in the North Sea area within *Small Area EN* during summer 2009. More details are given in Annex D, item 3.3.2. The Committee **welcomes** this information and noted that these data would be included in a future abundance estimate for the North Atlantic common minke whales.

SC/62/RMP5 presented estimates of abundance for common minke whales in the Central Atlantic from the North Atlantic Sightings Survey conducted by Icelandic and Faroese vessels during June/July 2007. More details are given in Annex D, item 3.3.2.

The Committee **agrees** that the methods in SC/62/RMP5 followed the relevant RMP Guidelines. Annex D, table 1 lists the estimates of abundance in SC/62/RMP5.

The Committee **agrees** to adopt the estimates of abundance for 2007 for the CG and CIP *Small Areas* presented in Annex D, table 1 for use in the RMP.

The Committee **endorses** abundance estimates for the CM *Small Area* and for the Eastern *Medium Area*, by *Small Area*, for use in the RMP given in Annex D, table 2.

6.4.2 Recommendations and work plan

The Committee **recommends** that the boundaries in Annex D, fig. 1 be adopted for use when applying the RMP for North Atlantic minke whales. It also **recommends** that abundance estimates in Annex D, tables 1 and 2 be adopted for use in the RMP. The Committee **agrees** that its work plan for the 2011 Annual Meeting will include the review of any new abundance estimates.

7. ESTIMATION OF BYCATCH AND OTHER HUMAN-INDUCED MORTALITY (BC)

The report of the Working Group on Estimation of Bycatch and Other Human-Induced Mortality is given as Annex J. This subject was introduced onto the Agenda in 2002 (IWC, 2003c) because as part of the Revised Management Procedure, recommended catch limits must take into account estimates of mortality due to *inter alia* bycatch, ship strikes and other human factors in accordance with Commission discussions at the 2000 Annual Meeting (IWC, 2001a), although of course such mortality can be of conservation and management importance to populations of large whales other than those to which the RMP might be applied. Subsequently, the issue of ship strikes has become of interest to the Commission's Conservation Committee (IWC, 2006a).

7.1 Collaboration with FAO on collation of relevant fisheries data

The effort to compile a comprehensive database of entanglement data in the national progress reports, an element of collaboration with FAO, has continued; the IWC Secretariat has now entered data from 2004-09.

7.2 Progress on joining the Fisheries Resource Monitoring System (FIRMS)

The information potentially to be developed in collaboration with FIRMS includes an inventory of fisheries, including gear characteristics and some indicators of fishing effort. The IWC will be eligible to move from observer status to full partnership in FIRMS after completion of the entanglement database (see Item 7.1, above). Details are provided in Annex J.

7.3 Estimation of bycatch mortality of large whales

7.3.1 Mortality in longline fisheries

The Committee received a global review of operational interactions between cetaceans and longline fisheries (SC/62/BC6). It reported deaths of humpback and Bryde's whales. In addition, mortality of southern right whales has been recorded elsewhere (Best *et al.*, 2001). Depredation by some species of cetaceans such as sperm and killer whales (Kock *et al.*, 2008; Kock *et al.*, 2006; Purves *et al.*, 2005) is of economic importance to some fisheries. Research to mitigate depredation and mortality can potentially contribute to estimating both fish and cetacean mortality rates.

7.3.2 Bycatches in Korea and Japan

Genetic analysis of samples of cetacean meat collected in markets in Korea in 2004-05 suggested that 90 common minke whales were represented (SC/62/NPM26). Details of the analyses are given in Annex J. The small number of samples from the same individuals suggests that the whales pass through the market rapidly. The reported bycatch for Korea for 2004 was 61. The detection of a minimum of 90 whales in the market indicates that the true bycatch was greater than reported. The reported bycatch for 2009 is 54. The results of the 2004-05 market survey analyses suggest that this is likely an underestimate.

The Committee welcomed publication of a recent paper describing incidental entanglement of minke whales in the Republic of Korea (Song *et al.*, 2010). This contained information that had been previously been requested of Korea by the Committee.

The Committee noted the need for time series of bycatch for the *Implementation Simulation Trials* for North Pacific common minke whales (see Item 6.3) for Japan and the Republic of Korea. The Committee reviewed the method presented in SC/62/NPM4 to estimate past incidental catches of minke whales in Japan (details are given in Annex J). Concern was raised regarding the multiplicative factor used to adjust reported catch figures for the period 1979-2000. It was noted that there was considerably more variability in the early reported figures, with CVs for the 1980s and 1990s three to six times higher than since 2001. For this reason, some members suggested that a multiplicative adjustment was not appropriate and that the reports of zero bycatch for some years, (which also resulted in zero estimates) were implausible. Other members considered that estimates in SC/62/NPM4 are an improvement compared to the previous assumption of 100 animals each year over a 100-year period. Butterworth commented that point estimates of zero for some years did not necessarily invalidate the method as a basis for estimating cumulative bycatch mortalities over time, which was the primary input required for *Implementation Simulation Trials*; nevertheless he encouraged refinement of the method presented.

In conclusion, the Committee **recommends** that additional analyses to arrive at time-series of bycatches in the region be undertaken for presentation to the preparatory meeting for the first intersessional workshop. In response to a suggestion from some members that bycatch in fisheries other than set nets warrants further examination, including historical information on past fisheries, e.g. the Japanese squid driftnet fishery of 1978-1992 (Yatsu *et al.*, 1994); it was noted that bycatches occur only rarely in types of gear other than set nets in Japanese waters, as reported in the national progress reports of Japan.

7.4 Estimation of risks and rates of entanglement

7.4.1 Report of intersessional workshop

The Committee noted relevant information on entanglement mortality in an advance copy of the report of the Commission's intersessional Workshop on Welfare Issues Associated with the Entanglement of Large Whales (IWC/62/15). The Workshop concluded that:

(1) all species of large whales are at risk of entanglement to varying degree, but common minke, humpback, right (both North Atlantic and southern) and gray whales are the most frequently reported;
(2) all types of stationary or drifting gear (i.e. not actively towed) pose potential risk to entangle, but pound, set and fyke-type nets, along with gill nets and various pot-type gear were most frequently implicated;
(3) entanglements can occur wherever this type of gear and large whales overlap in distribution, and isnot limited to feeding grounds but also includes breeding grounds as well as migratory pathways;
(4) given the cryptic nature of large whale entanglements in combination with the paucity of experienced observers and lack of formal reporting networks, entangled whales are severely underreported globally; and
(5) regional shifts in fisheries and gear types can produce major differences in the character of entanglements and reporting frequency (e.g. coastal versus offshore gear placement).

Based on these conclusions, the Workshop made the following relevant recommendations:

(1) that coastal nations establish adequate programmes for monitoring entanglement of whales; and
(2) that member countries improve reporting to the IWC through National Progress Reports.

The Committee **endorses** these recommendations. In addition it **recommends** that:

(1) all member countries which have coastal fishing operations be encouraged to more accurately report the occurrence and nature of large whale entanglements and establish entanglement response programmes where applicable;
(2) existing and new programmes communicate with each other to standardise the data collected to maximise their usefulness; and
(3) members be encouraged to facilitate thorough examinations of carcasses, at a minimum to record whether fishing gear is present, or fresh scars which might have resulted in mortality are visible, as well as facilitating necropsies on all large whales whenever possible. Such investigations should be conducted irrespective of population status, since this will be required to better estimate entanglement mortality rates including for species and populations that may be subject to whaling.

Additional details reported concerning the entanglement response networks of various nations are given in Annex J.

7.4.2 Entanglement mortality in Oman

An analysis of scars in the peduncle region indicates that 30-40% of whales observed in the isolated and severely depleted population of humpback whales in the western Arabian Sea (known as Breeding Stock X) were likely to have been involved in entanglements (SC/62/SH20). Of 10 stranded baleen whales, three were entangled in gill nets. Fishing effort, including use of drifting and set gillnets and fish traps, is increasing rapidly in the region. The Committee **welcomes** the establishment of a national stranding committee by the Government of Oman, and **recommends** that all member states that do not have national stranding networks to establish these. The importance of indications of fishing effort was also emphasised. The possibility of this population being considered as a candidate for a conservation management plan is discussed under Item 11.2.2.4.

7.5 Progress on including information in National Progress Reports

The data on entanglements and ship strikes reported in this year's National Progress Reports are summarised in Appendix 2 to Annex J. The Committee last year considered a proposal for developing a mechanism for online submission of the information; progress on issues related to online submission of bycatch and other information is discussed further under Item 3.2 and 25 and in Annex P.

7.6 Review of methods to estimate mortality from ship strikes

7.6.1 New data on ship strikes

The Committee received a report on ship strikes affecting southern right whales in Uruguayan waters (SC/62/BC2); between 2003 and 2007, seven whales were observed with large wounds due to collision and five were stranded dead. The Committee **welcomes** this information, noting that this is the type of information requested to be included in the national progress reports; in combination with data on shipping traffic, it may allow comparative analysis of ship-strike rates along the Atlantic coast of South America.

After consideration of a report of a 'near miss' between a humpback whale and a cruise ship in the Antarctic (see Annex J, item 10.1), it was **agreed** that a study of near-miss data (it is known that ferry operators in Hawaii collected such data) may yield additional insight into the dynamics of ship strikes and provide input for modelling risk (see below).

7.6.2 Progress in modelling risk

A report was received on progress in a series of winter and summer surveys of fin whale distribution and abundance in the Mediterranean Sea especially near the Italian coast and in the Pelagos Sanctuary. These surveys are in part intended to improve evaluation of population level effects of human-induced mortality including ship strikes. Details of the results are in Annex J. Plans to collect data on ship traffic were also detailed. The Committee **encourages** continuation of this effort that makes an important contribution towards the modelling of risk and assessing population level effects.

7.7 Progress in developing global database of ship strikes

This effort has been underway since 2007, with associated activities by IMO and ACCOBAMS. Tasks identified at last year's meeting have been completed or are nearly completed. Progress has relied on informal arrangements among the Secretariat, members of the data review group, and an external contractor. In view of the increasing workload and proposed intersessional tasks, detailed in Annex J, Appendix 3, the Committee **recommends** that consideration be given to the appointment of a dedicated coordinator; this is the practice for other similar successful databases of this scale. Funding requested to support intersessional work including data validation, the creation of a handbook and for work on data entry is discussed under Item 24.

The Committee **endorses** the policy on release of information in the database in response to requests from the public detailed in Annex J, Appendix 3. Information from nine fields in the database will be eligible for release on a down-loadable basis. Only data on confirmed ship strikes will be released. Requests for full access will be dealt with on an individual basis.

The Committee noted that IWC and ACCOBAMS will hold a joint workshop in Monaco from 21-24 September 2010 on reducing risk of ship strike and that some agenda items will be relevant to data gathering and estimating numbers of collisions. The IWC also continues to collaborate with IMO on efforts to minimise the risk of ships strikes and to reduce underwater noise from commercial shipping (Annex K, item 9.4).

7.8 Other issues

7.8.1 Methods for assessing mortality from acoustic sources

There was no new information on this topic. However, the Committee noted development of an improved method for handling and analysis of gas embolisms found in stranded cetaceans (Bernaldo de Quiros *et al.*, 2010); such embolisms may be linked with acoustic sources. A workshop entitled 'Diving marine mammals gas kinetics' was held in Woods Hole, MA, USA in April 2010 and the Committee looks forward to receiving the report at next year's meeting.

7.8.2 Methods for assessing mortality from marine debris

Methods used in a study modelling co-occurrence of debris and cetaceans (SC/62/BC5) have potential value for assessing mortality from debris. The Committee **recommends** that full necropsies be conducted on all stranded large whales, irrespective of population status, to detect incidents of mortality associated with ingested debris (and see the earlier recommendation on entanglement).

7.8.3 Other potential sources of human-induced mortality

The Committee noted that while there have been no confirmed reports of whale mortality due to collisions with marine renewable energy developments, the potential exists for such (SC/62/E7 and E8) and see Carter *et al.* (2008).

7.8.4 Actions arising from intersessional requests from the Commission

The Committee was asked to review Annex {DNA} of IWC/62/7rev. This contains a section on market sampling. Although the proposed scheme has the purpose of acting as a deterrent to illegal activity, the Committee noted that it might also potentially provide information for estimating bycatch. A workshop and simulation studies were conducted in the past by the Committee to assess the possibilities for developing a market sampling system to estimate bycatch (details in Annex J).

8. ABORIGINAL SUBSISTENCE WHALING MANAGEMENT PROCEDURE (AWMP)

This item continues to be discussed as a result of Resolution 1994-4 of the Commission (IWC, 1995a). The report of the SWG on the development of an aboriginal whaling management procedure (AWMP) is given as Annex E. The Committee's deliberations, as reported below, are largely a summary of that Annex, and the interested reader is referred to it for a more detailed discussion. The primary issues at this year's meeting comprised: (1) *Implementation Review* of eastern gray whales; (2) various aspects of providing management advice for Greenlandic hunts; and (3) review of management advice for the humpback whale fishery of St. Vincent and The Grenadines. This represented a significant workload. The Chair of the SWG noted that its work this year had been considerably assisted by the progress made at the intersessional Workshop on Greenland fisheries held in Roskilde, Denmark (SC/62/Rep3).

In addition, he recalled that two years ago (IWC, 2009c), the Committee had tested and agreed a safe method to provide interim advice (i.e. catch limits for up to two 5-year blocks) such that the catch limit is 2% of the lower 5th percentile of the most recent estimate of abundance.

8.1 Sex ratio methods for common minke whales off West Greenland

The Committee has been evaluating assessment methods for common minke whales off West Greenland that rely on the relationship between the observed sex ratio of catches and that inferred from population models parameterised in terms of carrying capacity, productivity and how the distribution of males may have changed relative to that of females. This concept was introduced in 2005 (IWC, 2006b; Witting, 2005). The major factor which suggests that sex-ratio data may be informative about population size is that catches have consistently been female-dominated. 'Best' estimates of population size from sex ratio based methods are infinite, in effect indicating that any level of past catches would not have impacted this population of minke whales. However, it is standard Scientific Committee practice, in accordance with a precautionary approach, to base management advice primarily on lower confidence bounds for such estimates. The Committee has therefore focussed attention on developing the novel assessment approach required to calculate these bounds.

Considerable technical work was undertaken by the SWG during the intersessional period with a view to being able to test the approach with an initial set of robustness trials as described in SC/62/Rep3. However, implementation of the new method is proving extremely difficult. The details of this are complex and can be found in Annex E, item 3.1.3 but in short can be said to be due to the continued difficulties the SWG has faced with the likelihood function that underlies the sex-ratio approach.

Several remedies were considered by the SWG. The most promising of these was to re-parameterise the analysis by replacing *K* (carrying capacity) with a suitable transformation. This can be thought of as a high-risk/high-reward option: it could provide an adequate basis for estimation thereby eliminating many of the intricacies that continue to plague the current framework, but it may introduce new difficulties.

The Committee **endorses** the SWG recommendation that this approach receive the highest priority during the next intersessional period. If a transformed analysis could be completed and agreed at the 2011 Scientific Committee meeting, the sex-ratio method could be used as a basis for abundance estimation and submitted to appropriate simulation trials to test performance and robustness. If these trials are passed, the approach could then be used for providing management advice and as a basis for a long-term *SLA* (Item 8.3).

The SWG also considered a number of other options which would not require such a drastic change but which it considered had less chance of being successful, as can be seen in Annex E. An option to try raising the current truncation point was shown not to solve the issue as a result of runs undertaken after the SWG had completed its work.

The SWG had agreed that the continued difficulties in successfully implementing a sex-ratio approach required a re-evaluation of its work plan. The original motivation for this work had been the Committee's inability to provide management advice for this hunt. Thus, reflecting the priorities of the Scientific Committee and the Commission, work on a sex ratio estimation of abundance for West Greenland common minke whales has been the dominant focus of SWG effort for a number of annual meetings and three intersessional workshops.The participants have devoted considerable research effort to this task, the work has been scientifically challenging and methodologically innovative and the potential gain in terms of providing adequate management advice extremely high. However, despite enormous effort, no satisfactory conclusion has been achieved to date. Last year, the Committee had agreed an abundance estimate for common minke whales off West Greenland that, in conjunction with the agreed approach to provide safe interim advice for up to two five-year blocks, meant that the Committee was able to provide satisfactory management advice for the first time.

Therefore, the SWG had concluded that it would no longer prioritise development of the sex ratio approach unless a comprehensive final analysis could be endorsed at the 2011 Scientific Committee meeting. Although it would be regrettable to abandon the sex ratio effort without obtaining an agreed abundance estimate, there are many other urgent issues to which the SWG must turn its focus. The Committee **concurs** with this view.

8.2 Conduct *Implementation Review* of eastern North Pacific gray whales

In 2004, (IWC, 2005d), the Committee presented the Commission with its recommended Gray Whale *Strike Limit Algorithm* (the *Gray Whale SLA*) and this was endorsed by the Commission. The scheduled 2009 *Implementation Review* had been postponed because a number of key analyses would not be ready in time.

The purpose of an *Implementation Review* is to update information on catch history and abundance and to determine whether any other new information that has become available in the intervening (normally) 5-year period indicates that the present situation is outside the region of parameter space tested during *SLA* development. If this is the case, additional trials will need to be developed to test the performance of the *SLA* in this new region. If performance is found to be unacceptable under these new trials, revisions to the *SLA* will be required.

Full details of the parameter space investigated in the development of the *Gray Whale SLA* can be found in IWC (2005d). In practical terms, the most important issues relevant to the present *Implementation Review* relate to the issues of stock structure and updated information on abundance/trends.

8.2.1 The issue of the DAA and the conduct of this Implementation Review

Implementation Reviews are subject to the Committee's Data Availability Agreement incorporating a timetable of events. Although many datasets and analyses were completed within the appropriate timelines, unfortunately, just before adoption of its report, the SWG had realised that the photo-id and genetics data central to its discussions of stock structure and movements had not formally been submitted to the IWC under the DAA (although the papers themselves had met the appropriate deadlines). The same is also true for the telemetry data that, while not central to the conclusions reached, was also discussed under that Agenda Item; in this case the paper also did not meet the appropriate deadline.

The Committee recognised that discussions of these data cannot be considered as part of the *Implementation Review.* Thus although the *Implementation Review* is considered complete with respect to the discussions involving the data properly made available under the DAA, it **recommends** that a new *Implementation Review* takes place at the next Annual Meeting. This is to enable the SWG to take properly into account the important new information received this year that had not met the DAA timeline and that could indicate that the original trial structure was not sufficiently broad (see Item 8.2.7). This issue is referred to, where appropriate, in other parts of this report. A mechanism to ensure that this unfortunate event does not happen again is discussed under Item 8.2.8.

8.2.2 Stock structure

In the development process for the *Gray Whale SLA*, the possibility of a summer feeding aggregation along the Pacific coast between California and southeast Alaska was noted (e.g. IWC, 2001h) but the Committee had agreed that a single stock scenario was the most appropriate (IWC, 2002d).

Considerable new information has been collected since that time on the animals feeding along the Pacific coast and the SWG received three papers of relevance to stock structure at this meeting (unfortunately, as noted above, these did not meet all of the DAA requirements). Although different names have been used in the past by different authors (e.g. the southern feeding group, the Pacific Coast Feeding aggregation), the Committee **agrees** to refer to the animals that spend the spring, summer and autumn feeding in coastal waters of the Pacific coast of North America from California to southeast Alaska as the Pacific Coast Feeding Group or PCFG.

SC/62/AWMP1 presented an analysis of the genetic differentiation between the PCFG (using samples from Vancouver Island) and the larger population (using samples from Baja California). The authors concluded that their results suggest that the matrilines of the southern feeding group are demographically independent from those of the rest of the population, and therefore require separate management consideration.

SC/62/BRG32 reported the results of an 11-year (1998-2008) photo-id study examining the abundance and the population structure of eastern gray whales that spend the spring, summer and autumn feeding in coastal waters of the Pacific Northwest. With respect to stock structure, it concluded that there is one group of whales that return frequently and account for the majority of the sightings in the Pacific northwest during summer and autumn (i.e. the PCFG) and a second group of whales are apparent 'stragglers' encountered in this region after the main migration.

The discussion was also informed by consideration of telemetry data (SC/62/BRG21) and the details can be found in Annex E, item 2.2.

The Committee thanked the authors for these comprehensive papers. There was considerable discussion of them and their implications for stock structure. Despite some differences in interpretation and recognising that further analyses could be carried out, the Committee **endorses** the SWG's conclusion that the hypothesis of a demographically distinct PCFG was plausible and warranted further investigation. The implications of this for the *Implementation Review* are discussed under Item 8.2.7.

Telemetry data may provide the best estimator of residency times for PCFG gray whales in order to evaluate their relative vulnerability with respect to the spatial and temporal characteristics being considered for the Makah hunt. Analogous data from non-PCFG whales may also help determine if there are differences between PCFG and non-PCFG whales with regard to their migrations (distances from shore, water depths or timing) or other behaviours. Therefore, the Committee **recommends** that the satellite tagging work should continue and that these data be analysed with the goal of providing input (e.g. as required in mixing matrices, etc.) for any future trials of the *Gray Whale SLA*.

8.2.3 Catch data

Allison informed the SWG that the catch series had been updated to incorporate new information. The complete series can be found in Annex E, table 1.

8.2.4 Abundance and trends

Two papers relating to calf counts were considered, one from migration and one from the breeding grounds.

SC/62/BRG1 presented calf counts from shore-based surveys of northbound eastern North Pacific gray whales that have been conducted each spring between 1994 and 2009 in central California. Estimates were highly variable between years, with no sign of a positive or negative trend. Calf production indices, ranged between 1.6 - 8.8% with an overall average of 4.2%. The authors hypothesised that a late retreat of seasonal ice may delay access to the feeding areas for pregnant females and reduce the probability that existing pregnancies will be carried to term.

SC/62/BRG36 reported on changes in the abundance of gray whales inferred from boat surveys at Laguna Ojo de Liebre and Laguna San Ignacio between the late 1970s to the present. There was a decrease in the numbers of cow-calf pairs in both lagoons during 2007 to 2009, similar to the results from shore-based surveys at Piedras Blancas during the northbound migration. The counts of cow-calf pairs in both lagoons in 2010 were the lowest over the last 15 years.

In discussion, it was noted that the calf production indices were particularly low (<3%) during two periods (1999-2001 and 2007-09). During the first period, calf counts were low and high numbers of strandings also occurred. However, although the calf counts were low during 2007-09, there is no evidence for higher numbers of strandings during these years. The Committee noted that the calf production indices are being used in its discussion of MSY rates (see Item 5.1). Although the time-series of calf counts is now 16 years long, this is only just long enough to allow estimation of these parameters.

The Committee therefore **recommends** that these data continue to be collected and are reviewed during future *Implementation Reviews*. The series of cow-calf counts in lagoons, which provide a relative index not absolute estimates, are consistent with the calf counts given in SC/62/BRG1.

The Committee noted that the calf count data had been used during the initial development and *Implementation* for eastern gray whales and **agrees** that the new information did not indicate a need to modify the trials structure.

The Committee had two new papers relating to total abundance estimates. The first, SC/62/BRG8 reported a promising new approach that has recently been adopted for the counts of southbound migrating whales at Granite Canyon, California, which form the basis of abundance estimation for the eastern gray whales. The authors recognised the need for new calibration data to evaluate the different biases of new counting methods and new observers before count data can be reliably rescaled to estimate abundance.

The Committee welcomed this report, noting the importance of ensuring comparability among years in any long-term monitoring effort. It **recommends** that data be collected to re-evaluate pod size bias given the change in survey protocol and that variance estimates for future survey estimates of abundance account for the uncertainty associated with calibration of abundance estimates computed using different survey protocols.

The second paper, Laake *et al.* (2009), re-evaluated the data from all 23 seasons of shore-based counts for the Eastern North Pacific stock of gray whales conducted throughout all or most of the southbound migration near Carmel, California using a common estimation procedure and an improved method for treatment of error in pod size and detection probability estimation.

In addition to these papers, the Committee noted that the telemetric information in SC/62/BRG21 provided the first confirmation of day/night migration rates since the original

Table 2
Time-series of agreed abundance estimates of eastern gray whales for use in the *Gray Whale SLA* (taken from Laake *et al.*, 2009).

Year	Estimate	CV	Year	Estimate	CV
1967/68	13,426	0.094	1979/80	19,763	0.083
1968/69	14,548	0.080	1984/85	23,499	0.089
1969/70	14,553	0.083	1985/86	22,921	0.081
1970/71	12,771	0.081	1987/88	26,916	0.058
1971/72	11,079	0.092	1992/93	15,762	0.067
1972/73	17,365	0.079	1993/94	20,103	0.055
1973/74	17,375	0.082	1995/96	20,944	0.061
1974/75	15,290	0.084	1997/98	21,135	0.068
1975/76	17,564	0.086	2000/01	16,369	0.061
1976/77	18,377	0.080	2001/02	16,033	0.069
1977/78	19,538	0.088	2006/07	19,126	0.071
1978/79	15,384	0.080			

radio tag information that has been used when estimating abundance from the southbound census. The Committee thanked the authors for this comprehensive and careful review of this extremely valuable time-series of absolute abundance estimates. It **recommends** that the estimates of abundance given in Table 2 be **adopted** for use in the *Implementation Review* and for use when applying the *Gray Whale SLA*.

SC/62/BRG32 referred to under Item 8.2.2, also used the photo-id data to estimate the abundance of the PCFG. Abundance estimates for whales present in summer and autumn were estimated using both open and closed population models. Methods were proposed to remove the 'stragglers' from both types of analyses, to estimate abundance only of regularly returning whales. Three methods and four geographic scales revealed the abundance of animals that regularly return to the Pacific Northwest to be at most a few hundred individuals.

The Committee **agrees** that these data will be extremely useful during the proposed 2011 *Implementation Review*, along with telemetry data, to determine the probability that animals from the putative feeding aggregation in the Pacific Northwest are at risk of being caught during hunts in that area (see Annex E, item 2.6). The estimates in SC/62/BRG32 will also be useful to condition any trials developed to examine the performance of *SLA* variants for this feeding aggregation.

8.2.5 Assessment
SC/62/AWMP2 fitted an age- and sex-structured population dynamics model to data on the catches and abundance estimates for the ENP stock of gray whales using Bayesian methods. The prior distributions used for these analyses incorporated the revised the estimates of abundance in Laake *et al.* (2009) and SC/62/BRG1, and account explicitly for the drop in abundance caused by the 1999-2000 mortality event. A series of sensitivity analyses were conducted. The baseline analysis estimated the population to be above MSYL and the 2009 population size (posterior mean of 21,911) to be at 85% of its carrying capacity (posterior mean of 25,808); conclusions were consistent across all the model runs. SC/62/AWMP2 only estimated an extra mortality parameter for 1999-2000 based both on calf and strandings data and the analysis of Brandon and Punt (2009a; 2009b) in which annual parameters were estimated for reproduction and survival.

The Committee thanked the authors of SC/62/AWMP2 for the updated assessment. It **agrees** that the results of the assessment are within the bounds considered during the *Implementation*. Although the base operating model used to estimate the *Gray Whale SLA* did not explicitly include the 1999-2000 event, robustness tests involving catastrophic mortality events were conducted and the *Gray Whale SLA* performed adequately for these tests.

8.2.6 Strandings data
SC/62/BRG25 provided a summary of all gray whale strandings in California, Oregon and Washington between 1 January 2010 and 31 May 2010. The Committee welcomes this information, **agrees** that it showed that stranding levels were now similar to 'normal' years, and **recommends** that these data continue to be collected and presented to the Committee.

8.2.7 Consideration of need for new trials (and, if applicable, results of those)
The Committee refers to its earlier comments on the situation with respect to the DAA and the need for an *Implementation Review*.

Although some of the papers/data available could not be considered in terms of the 2010 *Implementation Review*, the Committee **agrees** that the information provided on the PCFG was such that its existence represents a plausible hypothesis, not considered in the original *Implementation*. In accord with Committee guidelines for this process (IWC, 2005b), this is sufficient to trigger a new *Implementation Review* in 2011. The reason that this hypothesis is important from an AWMP perspective relates to the potential harvesting in this region by the Makah Tribe and thus the need for the SWG to provide advice/develop an *SLA* to fulfil both the 'conservation' and 'user' objectives given by the Commission. It noted that the situation for PCFG is not the same as for the Greenlandic feeding aggregation of humpback whales; the latter case involves a feeding aggregation that does not occur (even in the short-term during migration) with animals from other feeding aggregations in the waters where the hunt takes place. In the case of the proposed area for the Makah hunt, both PCFG and migrating whales from the other feeding areas co-occur at least some of the time. In fact the situation is more similar to that of Gulf of Maine humpback whales.

The Committee therefore **agrees** that the information on stock structure and hunting warranted the development of trials to evaluate the performance of *SLA*s for hunting in the Pacific northwest at the 2011 *Implementation Review*. The Committee also noted that the assessment work discussed above (Item 8.2.5) showed that the population as a whole is in a healthy state. It **agrees** that for the purposes of the 2011 *Implementation Review*, the primary focus should be the PCFG.

That being said, it also **agrees** that over the next few years (i.e. in time for an *Implementation Review* in about 2016), further work should be undertaken to investigate the possibility of structure on the northern feeding grounds, especially in the region of the Chukotkan hunts. It **recommends** that relevant information be collected from the Chukotkan region, in particular, where possible, including genetic samples and photographs from the hunt). In addition, the collation of information on the geographical and temporal distribution of the hunt will be valuable.

Annex E, item 2.6 provides some general guidance for the 2011 *Implementation* Review. The Committee **agrees** that any acceptable future *SLA* for the hunt in the Pacific northwest must include a feedback mechanism. It also requests that the Chair of the SWG discuss its requirements for need envelopes with the hunters and members of the

US delegation. The Committee **agrees** that the following would assist, but are not required for beginning, the trial development process:

(1) Collection/analysis of genetic data that would allow more robust comparison of such data from animals in the northern and southern feeding areas;
(2) Collection/analysis of genetic data from Kodiak Island to California to further examine the probable range of the PCFG;
(3) Collection/analysis of genetic data to compare further animals seen in only one year ('stragglers' in SC/62/BRG32) with animals that are frequently seen within the hunting area;
(4) Collection/analysis of additional information (including telemetry data) on the relative temporal 'availability' of PCFG animals within the hunting area (e.g. by month); and
(5) An updated analysis of any additional data to obtain the most recent abundance estimate for the PCFG at the time of the 2011 *Implementation Review.*

8.2.8 Conclusions and recommendations

In light of the DAA difficulties discussed earlier, the Committee **agrees** that it has completed the *Implementation Review* on the basis of the data that had been made available to it in accord with the DAA. However, given the new information available that did not meet the DAA conditions, it **agrees** that a new *Implementation Review* should occur in 2011 to take into account information provided on the PCFG which was presented outside the DAA as noted under Items 8.2.2 and 8.2.7. The Chair of the SWG **agrees** to ensure that all likely contributors to the review are made aware of the DAA requirements as well as the guidelines for genetic analyses and data. The draft guidelines for *Implementation Reviews* referred to under Item 8.4 will also assist this process. The Committee also **agrees** that preparatory discussions for the 2011 *Implementation Review* take place at the proposed intersessional workshop (see Item 21). Management advice for this population can be found under Item 9.2.2.

8.3 Continue work on developing *SLA*s for the Greenlandic fisheries

In 2009, the Committee agreed an approach for providing safe interim advice on catch limits that is valid for up to two five-year blocks. In doing so, this provides time for the SWG to develop long-term *SLA*s for the Greenlandic fisheries. Work on this has progressed in general terms (e.g. see discussion in SC/62/Rep3 and Annex E, items 3.3 and 4.2). However, particularly given the complexity of the multispecies hunt in Greenland, the Committee **agrees** that this must be given high priority for the future work of the SWG, such that suitable *SLA*s can be developed and tested before the interim advice expires.

Simulation evaluation of *SLA*s requires the development and parameterisation of a set of operating models. Unlike the situation for West Greenland common minke whales, the SWG has an assessment for West Greenland fin whales which means that it is in a better position to develop an *SLA* for fin whales. Last year, it was agreed that the set of RMP trials developed to evaluate variants of the RMP for North Atlantic fin whales would be an appropriate starting point for developing such trials and this year the SWG was presented with a summary of the stock structure hypotheses underlying those trials. These will need to be modified to focus more on the uncertainties pertinent to West Greenland if they are to form the basis for evaluation of *SLA*s for fin whales. Unfortunately, the SWG did not have time to consider this further at the present meeting.

With respect to common minke whales off West Greenland, the SWG had previously been awaiting the outcome of the evaluation of a sex ratio method approach before addressing the issue of long-term *SLA*s; the decision potentially to cease work on a sex-ratio abundance estimate in 2011 (see Item 8.1) does not affect the need to begin work on an *SLA* as soon as possible. As noted in SC/62/Rep3, consideration of existing RMP trials for North Atlantic common minke whales may again prove a useful starting point for discussions.

In conclusion, the Committee **re-emphasises** the importance of developing *SLA*s for Greenlandic fisheries as soon as possible. It **agrees** that this should form the primary item for discussion at the intersessional workshop.

8.4 Consider lessons learned from the bowhead whale *Implementation Review*

Two main issues arising from the bowhead *Implementation Review* relating to: (1) stock structure and in particular genetic samples; and (2) data availability. In relation to the first of these two issues, the Committee noted that there are now guidelines for DNA data quality (IWC, 2009h).

In relation to the general question of data availability, a number of issues were raised in the SWG (see Annex E, item 8). One reason for the difficulties encountered was the lack of explicit guidelines for conducting *Implementations* and *Implementation Reviews* for the AWMP process, noting how valuable these had proved for the RMP process. The Committee **agrees** that Donovan should develop a draft of such a document for consideration at next year's meeting.

8.5 Aboriginal Whaling Scheme (AWS)

In 2002, the Committee strongly recommended that the Commission adopt the Aboriginal Subsistence Whaling Scheme (IWC, 2003a, pp.22-23). This covers a number of practical issues such as survey intervals, carryover, and guidelines for surveys. The Committee has stated in the past the AWS provisions constitute an important and necessary component of safe management under AWMP *SLAs* and it **reaffirms** this view. It noted that discussions within the Commission of some aspects such as the 'grace period' are not yet complete.

8.6 Other

8.6.1 Conversion factors for edible products for Greenland fisheries

IWC/62/9 is the report of a Small Working Group (Donovan, Palka, George, Hammond, Levermann and Witting) established by the Chair of the Commission to provide advice on conversion factors for the Greenlandic hunt. The report of the group was presented to the intersessional Commission meeting to consider Greenlandic strike limits. In discussion of the report at that meeting, it was agreed that there was no need for the report to be reviewed in detail by the Scientific Committee but that individual scientists should send comments to the authors so that the report could be revised, if necessary, by the Commission meeting in Agadir. That request and the document itself was circulated to the Scientific Committee with a request for comments by 6 June 2010. However, it had been agreed that this issue would be added to the SWG agenda.

A short summary of the report, which has been available on the IWC website since February 2010, is given in Annex E, item 9.1[2].

[2]The full 52 page report can be found at *http://www.iwcoffice.org/_documents/commission/IWC62docs/62-9.pdf.*

In discussion of IWC/62/9 during the present meeting, one member provided a number of comments on the underlying approach to calculating conversion factors, as well as to the quality of the data used by the authors. Points raised included whether conversion factors should be based only upon what product yield has been achieved in the past, or whether it should consider what could be achieved with significant improvements in processing efficiency. He also commented on the likely inaccuracy and unreliability of the hunter collected data. He suggested that Greenland be asked to come back next year with data of verifiable quality on length and product yield, and/or that the Committee be given details of the new data collection methods, together with information on the process by which the reliability of the product yield data is verified. In response, the authors noted that they had spent considerable time and effort in investigating the original data, recognising that it had not been collected by scientists for the purposes of estimating conversion factors. The large sample size and the consistency with edible product information collected by scientists in the North Pacific, revealed that the data for common minke whales were sufficient to calculate a robust conversion factor (as well as showing the flensing process to be efficient). The limitations of the conversion factors provided for the other species were recognised in the report and considered interim pending the recommended collection of additional data on length correction and edible products. They had offered to assist in appropriate experimental design. They also noted that it would take some time to obtain sufficient sample sizes for some species. They concluded that matters of efficiency were appropriate for discussion by the Commission.

The Committee endorsed the **recommendations** of the report. In particular, it supported the recommendations for further work that data on both 'curved' and 'standard' measurements are obtained during the coming season for common minke whales, fin whales and bowhead whales and that new data on edible products be collected using properly-design protocols, analysed appropriately and reviewed. It also supported the recommendation that the work be undertaken by scientists, hunters and wildlife officers since this would improve the ability of hunters, particularly those in remote areas, to obtain more accurate length and weight measurements. The Committee was informed that Greenland has already begun to implement some of the recommendations of the Small Working Group and they will be implementing all of them in the next season. There is now increased collaboration between hunters, scientists and managers and improved estimates of the three types of edible product should be possible by having each product stored in separate bins and weighed. It was also noted that collaboration between hunters from Alaska and Greenland was underway with the respect to flensing techniques for bowhead whales. Finally, the Committee **requests** Greenland to provide information on its sampling scheme and data validation protocols to next year's meeting.

9. ABORIGINAL SUBSISTENCE WHALING MANAGEMENT ADVICE

9.1 Eastern Canada and West Greenland bowhead whales

9.1.1 Assess stock structure and abundance of Eastern Canada and West Greenland bowhead whales

The Committee has agreed at the previous three Annual Meetings to consider a single stock of bowhead whales in this region as the 'working hypothesis' while acknowledging that there is still some uncertainty about the population structure of bowhead whales in eastern Canada and western Greenland (e.g. IWC, 2009d). Last year, the Committee had expressed some disappointment that the expected genetic analyses had not materialised to take discussions further. It had noted that use of the term 'working' hypothesis implies that alternative hypotheses can still be considered and thus there should be consideration of both one stock and two stock hypotheses. The Committee was therefore pleased to receive this year a number of stock structure papers, some of which include the use of genetic data.

SC/62/BRG26 presented work on genetic differentiation of bowhead whales in Eastern Canada and Western Greenland. The study included sequence data for 346 individuals from Baffin-Bay-Davis-Strait and 197 individuals from Hudson-Bay-Foxe-Basin. There was a slight but significant genetic difference between the two areas in terms of F_{ST} based on haplotype frequencies. However, there was no differentiation between Hudson Bay-Foxe Basin and Cumberland Sound, an area presumed to be within the range of the putative Baffin Bay-Davis-Strait stock. In the context of other biological information available (SC/62/BRG23 and SC/62/ BRG25), the authors consider the observed F_{ST} to be consistent with the one stock hypothesis.

SC/62/BRG25 reported on the re-identification patterns of genetic markers from bowhead whales sampled in Eastern Canada and West Greenland. From the total of 647 identified individuals, 91 were re-identified within the same location and year. Of the remaining 556 individuals (208 males and 348 females), the authors found 16 re-identifications between years. Three of these were between sampling areas and all three had moved from the Hudson Bay-Foxe Basin area to the Baffin Bay-Davis Strait area. In addition, of the 20 new satellite tags put out in 2009 in Disko Bay, four animals had crossed assumed boundaries between putative stocks. The authors concluded that: (i) the low number of re-identifications between years indicates that the population is relatively large; and (ii) the high proportion of re-identifications and movements of satellite tagged animals between areas indicate a high rate of movement between the areas. In the authors' view, these results indicate that there is only one stock of bowhead whales in Eastern Canada and Western Greenland.

SC/62/BRG23 reported on the sexual segregation of bowhead whales sampled in Eastern Canada and West Greenland. Genetic samples (the same as used in the previous two papers) were obtained from one location in West Greenland: Disko Bay (April-June 2000-09) and four locations in Eastern Canada: Pelly Bay (September 2000-02), Cumberland Sound (June-August 1997-2006), Foxe Basin (July-August 1994-2007) and Repulse Bay (September 1995-2005). The sex-ratio was significantly different from 1:1 in Disko Bay (76% females), but this was not the case in the remaining areas. The authors also reviewed available field observations and historical whaling records in the region, which provided further evidence of segregation. They concluded that Baffin Bay is mainly used by adult males and resting/pregnant females, whereas the Prince Regent, Gulf of Boothia, Foxe Basin and northwestern Hudson Bay areas are used by nursing females, calves and sub-adults. The Committee noted that the available information is consistent with some form of structured movement, but that this movement is still not well understood.

There was considerable discussion of these papers and their strengths and weaknesses in their ability to distinguish among stock structure hypotheses as can be seen in Annex F, item 4.2. Some members of the Committee interpreted the seasonal movements and resighting patterns between the two areas to mean that there is a single stock whilst others believed that these movements and the observed shallow population structure between some areas are still consistent with the two-stock hypothesis. The Committee **agrees** that the degree of population structure requires further work with additional molecular markers (nuclear loci) before a final conclusion can be reached and it also **recognises** the importance of the successful satellite tracking study. It **encourages** the continuation of work on structure in order to allow it to conduct a more in-depth analysis next year.

The Committee also received two papers on abundance (Annex F, item 4.2.2). SC/62/BRG28 reported the results of an aerial survey of the late-summer concentration of bowhead whales in Isabella Bay, Nunavut, Canada in September 2009. The resulting abundance of 1,105 (95% CI: 532-2,294) was corrected for whales that were submerged during the passage of the survey plane, but not for whales missed by the observers because >90% of the sightings were detected by both platforms.

SC/62/BRG34 summarised a preliminary evaluation of the potential to use photographs and capture-recapture analyses to estimate the size of the Eastern Canada-West Greenland stock(s) of bowhead whales. The large and often remote summer range of these animals makes it difficult to obtain an aerial survey estimate of abundance. On the other hand, photographic surveys benefit from mixing among the separate sampling areas and have been successfully used to estimate abundance of the B-C-B stock of bowhead whales. The authors proposed that photographic surveys be directed at areas of known summer aggregations. Photography methods and analyses for the proposed surveys would follow methods used for the 2004 B-C-B bowhead population estimate (Koski *et al.*, 2009), which has been accepted by the IWC. The Committee **welcomes** these papers and looks forward to further analyses at next year's meeting.

9.1.2 Review recent catch information

SC/62/BRG27 reported that two female and one male bowhead whales were taken in April-May 2009 and three females in April-May 2010 for subsistence purposes in Disko Bay, West Greenland (no whales were struck in 2008 and no whales were struck and lost in 2009 and 2010). In light of the uncertainties surrounding eastern Arctic bowhead stock structure and abundance, the Committee **requests** the Secretariat to contact Canada to try to obtain data on Canadian catches.

9.1.3 Management advice

In 2007, the Commission agreed to a quota for 2008 to 2012 of two bowhead whales struck annually off West Greenland but the quota for each year shall only become operative when the Commission has received advice from the Committee that the strikes are unlikely to endanger the stock. In 2008, the Committee was pleased to have developed an agreed approach for determining interim management advice (IWC, 2009c), that is valid for two five-year blocks. The Committee again **agrees** that the current catch limit for Greenland will not harm the stock (noting that this applies whichever stock structure hypothesis prevails). It was also aware that catches from the same stock have been taken by a non-member nation, Canada. It **agrees,** as in previous years, that should Canadian catches continue at a similar level as in recent years, this would not change the Committee's advice with respect to the strike limits agreed for West Greenland.

The Committee reviewed the catch limits in Table 4 of the Report of 'Proposed consensus decision to improve the conservation of whales from the Chair and Vice-Chair of the Commission' (IWC/62/7rev). For Eastern Canada/West Greenland bowhead whales, the Greenland strike limit is 2 per year (plus a carryover provision of two unused strikes from the previous year). The Committee **agrees** that the strike limits for Eastern Canada/West Greenland bowhead whales that are listed in table 4 of IWC/62/7rev are in accord with its advice, recognising that the normal regular review is also intended as part of IWC/62/7rev. However, the Committee notes that Canada may allow for regular catches from this stock. If the size of Canadian catches increases then the Committee's advice may change in that the total number of removals may exceed the safe limit determined by the agreed approach. If the Canadian catch increases, then the Committee wishes to draw attention to the fact that the total number taken from the stock may be greater than what is safe. Given the importance of this issue, the Committee **recommends** that the Secretariat should contact Canada requesting information about catch limits for bowhead whales.

9.2 Eastern North Pacific gray whales

9.2.1 Summary of previous season's catch data

A total of 115 gray whales (58 males, 57 females) was harvested in Chukotkan waters in 2009 and 1 was lost. A total of 6 of the 115 individuals were considered as unfit for consumption in 2009 (samples were taken from all 6). Biological sampling was conducted on 61 gray whales.

9.2.2 Management advice

As noted under Item 8.2, the Committee **agrees** that it has completed the *Implementation Review* but that a new *Implementation Review* should take place next year. In this context, the Committee **agrees** that its position with respect to the provision of management advice was unchanged from last year, i.e. the *Gray Whale SLA* remains the appropriate tool to provide management advice for eastern North Pacific gray whales. This remains the case, at least until the 2011 *Implementation Review* is completed.

In line with the values in table 4 of the proposed consensus decision (IWC/62/7rev), the Secretariat ran the *SLA* using the updated information on catches and abundance agreed at this meeting. This confirmed that an annual strike limit of 145 animals will not harm the stock (note that 145 is the maximum catch that can be taken in any one year; the annual average catch is 129 whales). The additional five whales added to the annual maximum in any one year from that previously considered (140) was intended to account for 'stinky' whales (IWC/62/7rev). In providing its advice, the Committee **draws attention** to the need for a new *Implementation Review* next year with a focus on PCFG whales. It was noted that although the table included strike limits for 10 years, the proposed consensus decision envisages the usual periodic reviews of strike limits for indigenous whaling.

Borodin commented that the annual strike limit should include the actual number of struck-and-lost whales and 'stinky' whales (e.g. in 2009 the numbers were 1 and 6, respectively). If hunting is on large whales then the number of struck-and-lost whales will be higher. Within that context, he noted that the annual strike limit should not exceed 150 whales (the number included in the *Gray Whale SLA* trials for the early period of catches during the development process).

9.3 Bering-Chukchi-Beaufort (B-C-B) Seas stock of bowhead whales

9.3.1 Review catch information and new scientific information

The Committee was pleased to receive two papers dealing with broad-scale aerial surveys from the northeastern Chukchi (SC/62/BRG13) and Alaskan Beaufort (SC/62/BRG14) Seas respectively. Details can be found in Annex F, item 4.1.1.

SC/62/BRG13 presented preliminary analyses of broad-scale aerial surveys for large whales in the northeastern Chukchi Sea that were conducted in 2008 and 2009, and compared these with results from similar surveys conducted in that region from 1982-91. The distribution of bowhead whale sightings during the light ice years of the early period (1982, 1986, 1989 and 1990) was similar to the distribution of bowhead sightings during 2008-09. There did not appear to be any major shifts in cetacean distribution between the early and late surveys although there were unexpectedly no gray whale sightings in the offshore shoal areas during 2008-09. In general, it was noted that analysing cetacean distribution in relation to environmental factors like sea-ice was complicated with this data set because the timing of the surveys was not consistent between years.

SC/62/BRG14 presented a similar preliminary study for the Alaskan Beaufort Sea, using data from the Bowhead Whale Aerial Survey Project (BWASP) in 2000-09, with comparisons to historical data. Bowhead distribution was similar in 2000-09 compared with the observed distribution from earlier years with light ice cover.

The Committee **recommends** that these surveys continue on an annual basis in the future in light of their capacity to monitor the effects of climate change and other factors (including anthropogenic activities) on cetacean distributions in the Beaufort Sea.

SC/62/BRG17 provided information about acoustic monitoring during attempts to count migrating bowhead whales near Point Barrow, Alaska in 2009 and to test new acoustic equipment. Results demonstrated the efficacy of a new seafloor array procedure and indicate that it can be used in the future as the method for obtaining acoustic data for the bowhead census and population estimation process. The Committee **welcomes** this report and **encourages** the use of autonomous seafloor acoustic recorders when monitoring migrating bowhead whales.

The Committee also received information on summarised preliminary analyses on identifying yearling bowhead whales in aerial photographs (SC/62/BRG29) and recent efforts to estimate the population size of this stock of bowhead whales (Annex F, item 4.1.1). The Committee welcomed this new information and notes that a full survey effort is being planned again in 2011. In discussion, the importance of monitoring the tails of the distribution of migrating whales was noted in the light of information from this year's migration.

9.3.2 Management advice

SC/62/BRG18 provided information on the 2009 Alaskan hunt. A total of 38 bowhead whales were struck resulting in 31 animals landed). Challenging sea ice conditions and weather contributed to a poor spring hunt. Of the landed whales, 12 were males, 18 were females, while sex was not determined for one animal. Hunters mistakenly harvested two female calves (lengths of 6.2m and 6.6m) in the autumn thinking they were small independent whales. Autumn calves are close in body length to yearlings and it is difficult to determine their status when swimming alone. Other details are given in Annex F, item 4.1.2. It was reported that there were no catches of bowhead whales by Russia this year.

The Committee **reaffirms** its advice from last year that the *Bowhead SLA* remains the most appropriate tool for providing management advice for this harvest. The results from the *SLA* show that the present strike limits are acceptable.

The next *Implementation Review* for B-C-B bowhead whales is scheduled in 2012. The purpose of the *Implementation Review* is to evaluate new information which has become available since the last *Implementation Review* and assess whether the current state is outside the realm of plausibility covered by the *Implementation* trials. If so, it may be necessary to conduct further trials incorporating such information. Therefore, the Committee **encourages** researchers to present relevant papers and new information for consideration during next year's meeting, so that preparations for the next *Implementation Review* can proceed efficiently.

The Committee reviewed the catch limits in table 4 of 'Proposed consensus decision to improve the conservation of whales from the Chair and Vice-Chair of the Commission' (IWC/62/7rev). For B-C-B bowhead whales, the maximum strike limit is 67 per year (plus a carryover provision of 15 unused strikes from the previous year) for total landed of 560 (580 written in footnote 8 is a typo). The Committee **agrees** that the strike limits for B-C-B bowhead whales listed in table 4 are in accord with the management advice provided by the *Bowhead SLA*, noting that the normal regular review is also intended.

9.4 Common minke whale stocks off Greenland (AWMP)

9.4.1 West Greenland

9.4.1.1 SUMMARY OF PREVIOUS SEASON'S CATCH

In the 2009 season, 153 minke whales were landed in West Greenland and 11 were struck and lost. Of the landed whales, there were 105 females, 47 males, and one whale of unreported sex. Genetic samples were collected for 97 of the 153 minke whales landed in 2009.

9.4.1.2 MANAGEMENT ADVICE

In 2007, the Commission agreed that the number of common minke whales struck from this stock shall not exceed 200 in each of the years 2008-12, except that up to 15 strikes can be carried forward. Prior to last year, the Committee has never been able to provide satisfactory management advice for this stock. Last year, the Committee was for the first time able to provide management advice for this stock. It had adopted a new abundance estimate and agreed method for providing interim management advice. Such advice can be used for up to two five-year blocks whilst *SLAs* are being developed (IWC, 2009c). Based on the application of the agreed approach, and the lower 5^{th} percentile for the 2007 estimate of abundance (i.e. 8,918), the Committee **repeats its advice** of last year that an annual strike limit of 178 will not harm the stock.

9.4.2 East Greenland

9.4.2.1 SUMMARY OF PREVIOUS SEASON'S CATCH DATA

Three males and one female common minke whale were struck (and landed) off East Greenland in 2009 (no animals were struck and lost; see SC/62/ProgRepDenmark). Genetic samples were obtained from two of these whales. Catches of minke whales off East Greenland are believed to come from the much larger Central stock of minke whales.

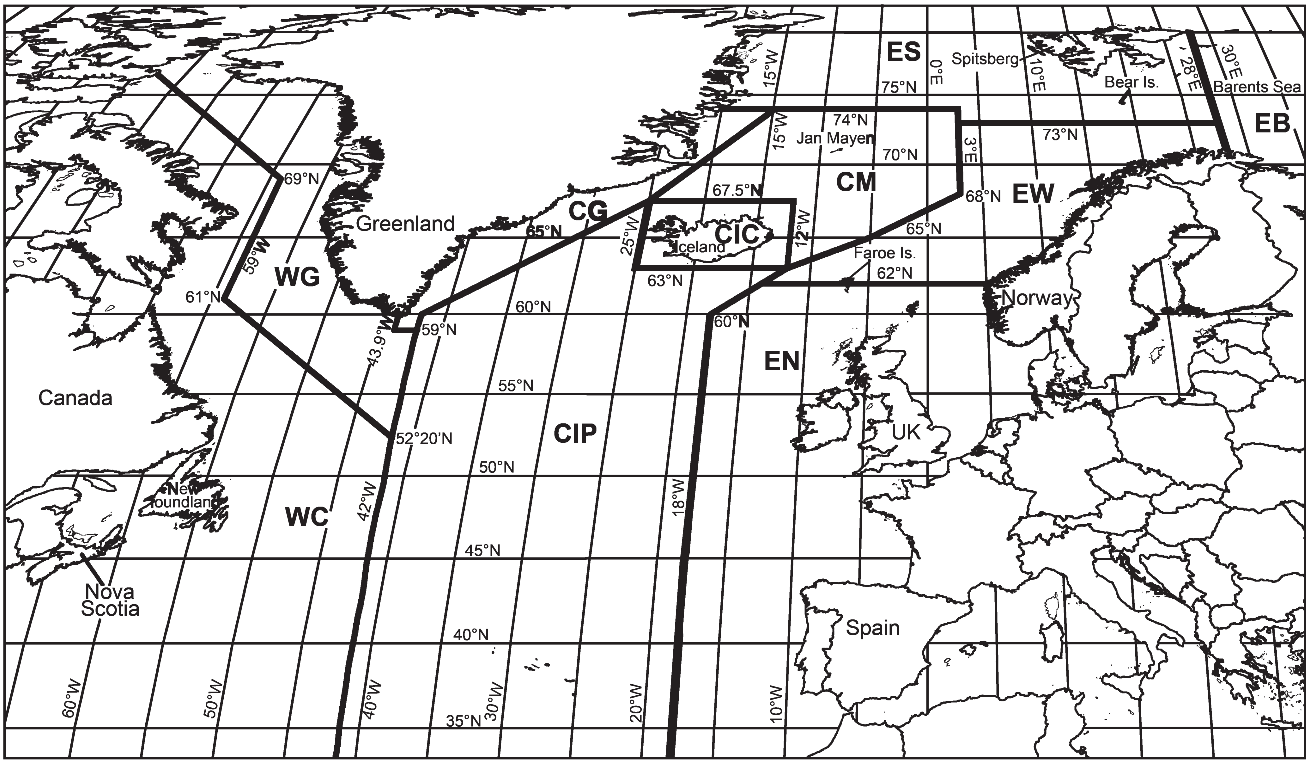

Fig. 2. The specifications for the Small Areas for the North Atlantic minke whales.

Table 3

Most recent abundance estimates for minke whales in the Central North Atlantic.

Small Area(s)	Year(s)	Abundance and CV
CM	2005	26,739 (CV=0.39)
CIC	2007	10,680 (CV=0.29)
CG	2007	1,048 (CV=0.60)
CIP	2007	1,350 (CV=0.38)

9.4.2.2 MANAGEMENT ADVICE

In 2007, the Commission agreed to an annual strike limit of 12 minke whales from the stock off East Greenland for 2008-12, which the Committee stated was acceptable in 2007. The present strike limit represents a very small proportion of the Central Stock (see Fig. 2 and Table 3). The Committee **agrees** that the present strike limit will not harm the stock.

9.5 Fin whales off West Greenland

9.5.1 Summary of previous season's catch data

A total of 8 (1 male; 7 females) fin whales were landed, and 2 struck and lost, in West Greenland during 2009 (SC/62/ProgRepDenmark). Genetic samples were collected for 5 of the 8 fin whales harvested during 2009.

9.5.2 Management advice

In 2007, the Commission agreed to a strike limit (for the years 2008-12) of 19 fin whales struck off West Greenland. The Committee agreed an approach for providing interim management advice in 2008 and this was confirmed by the Commission. It had agreed that such advice could be used for up to two five-year blocks whilst *SLA*s were being developed (IWC, 2009c). Based on the application of the agreed approach in 2008 (IWC, 2009c), the Committee **agrees** that an annual strike limit of 19 whales will not harm the stock.

9.6 Humpback whales off West Greenland

In 2007, the Committee agreed an approach for providing interim management advice and this was confirmed by the Commission. It had agreed that such advice could be used for up to two five year blocks whilst *SLA*s were being developed (IWC, 2009c). Using this approach, as last year, the Committee **agrees** that an annual strike limit of 10 whales will not harm the stock.

9.7 Humpback whales off St Vincent and The Grenadines

9.7.1 Summary of previous season's catch data

The Committee was advised that three females (lengths 34', 34'3" and 43'2") were taken during 2010. Neither genetic samples nor photographs were available for these animals. The Committee has encouraged St Vincent and The Grenadines to submit as much information as possible about any catches to the Committee via an Annual Progress Report.

The Committee **strongly recommends** collection of genetic samples for any harvested animals as well as fluke photographs, and submission of these to appropriate catalogues and collections. In respect of genetic samples, the Committee again **agrees** that the North Atlantic Whale Archive maintained by Per Palsbøll is an appropriate facility.

9.7.2 Management advice

In recent years, the Committee has agreed that the animals found off St Vincent and The Grenadines are part of the large West Indies breeding population. The Commission adopted a total block catch limit of 20 for the period 2008-12. The Committee **agrees** that this block catch limit will not harm the stock.

10. WHALE STOCKS

10.1 Antarctic minke whales (IA)

The Committee is currently continuing an in-depth assessment of the Antarctic minke whale. To complete this assessment, agreed abundance estimates from CPII and CPIII[3] are needed. Two different abundance estimation methods have been developed during the last few years, and although they give quite different point estimates, both are consistent in that they show an appreciable decline from CPII to CPIII. During the JARPA review in 2009, the quality of the Japanese ageing methods was questioned with implications for the catch-at-age analyses. During the present meeting, the priority topics discussed included: the two abundance estimation methods; the reasons for the differences between CPII and CPIII; age reading and the catch-at-age assessment models.

10.1.1 Produce agreed abundance estimates of Antarctic minke whales using IDCR/SOWER data

Skaug reported on work conducted by the Abundance Estimation Intersessional Working Group. Tasks to be considered by the group were directed towards elucidating possible causes for the difference in abundance estimates for Antarctic minke whales from the IDCR/SOWER data from the recent OK (Okamura and Kitakado, 2009) and SPLINTR (Bravington and Hedley, 2009) models. In completing most of these tasks, substantial progress had been made towards this in two regards: (i) development of a reference dataset for model comparisons; and (ii) Bravington had completed a non-spatial version of the SPLINTR model. For (i), a number of internal inconsistencies in the 'standardised' dataset were identified; as noted in IWC (2010f), it is essential that when comparing models, the data are identical. Since the purpose of this dataset is to allow appropriate comparisons between the models, the Committee **agrees** that this dataset is suitable for this purpose.

SC/62/IA14 provided results from applying the IWC 'standard' method (Branch, 2006), and the OK and SPLINTR models to simulated data, focussing on the latter two. In general, both models performed well, although when bias did occur, it tended to be positive for the OK model and negative for SPLINTR. The Committee thanked Palka for co-ordinating this extensive study. The simulated datasets have proved valuable in helping to develop and refine the models and for examining the differences between them. No simulated scenarios show the level of difference between the OK and SPLINTR estimates that the real data analyses reveal. This suggests either that the magnitudes of factors currently in the simulations do not cover the ranges found in the real data (either singly or in combination), or that there are additional factors not currently in the simulations that are important for modelling the real data.

During the pre-meeting and using the reference dataset, the OK and non-spatial SPLINTR outputs were compared. Estimated mean school sizes, effective strip half-widths, and encounter rates were combined using the simple line transect formula for estimating abundance. The resulting examination revealed that: (1) these estimated quantities from each model were being combined correctly to estimate abundance; (2) the effective strip half-widths for OK were about half of those of SPLINTR (i.e. the estimated abundances were approximately doubled, highlighting a need for further investigation); and (3) that the difference between the two models was not due to the data used and was probably not due to differences in mean school size. The Committee questioned whether sufficient progress had been made to determine whether further investigation was likely to determine the reason for the difference between the models. It **agrees** that if the Work Plan, including an intersessional workshop, is accomplished, there is a reasonable chance that this will be the case. It therefore **agrees** to proceed with these investigations until the 2011 Annual Meeting. The Committee also **agrees** a number of technical points related to this intersessional work (Annex G, item 5.1.8).

However, contingency plans (e.g. producing model-averaged estimates of abundance) will also need to be considered if it does not prove possible to resolve the difference in the estimates. Skaug compared estimates from OK, SPLINTR and a model-averaged estimate on the simulated data and found that the model-averaged estimator had smaller bias than either of the two individual models. There was some discussion on the appropriateness of using model-averaged estimates on the real data. However, as noted above, given the progress made this year, it is anticipated that the best outcome would be a resolution of the issue as a result of the intersessional work.

SC/62/IA3 and SC/62/IA12 presented the following 'survey-once' estimates (see Branch and Butterworth, 2001b) of abundance for the CPII and CPIII surveys from the OK and SPLINTR models respectively, as summarised in Table 4.

The Committee thanked both sets of authors for producing estimates and for the substantial amount of intersessional work, much of it collaborative. As last year, the issue is not that either set of diagnostics suggests not accepting the estimates, but rather that the estimates themselves are so different. This leads to the need to consider three – not necessarily unrelated – issues for next year: (1) pursuing the work to explain the differences; (2) the implications, if any, for future surveys; and (3) the procedural question of what the Committee should do if (1) does not succeed. As part of IWC/62/7rev, the Committee is expected to undertake an RMP *Implementation* for Antarctic minke whales in 2015 (and see Item 20). There is thus a pressing need for agreed absolute abundance estimates for the past surveys and an agreed method for analysing data from future surveys.

The Committee **strongly recommends** that the work plan and timeline set out in Annex G, Appendix 3 to finalise estimates be followed and completed. A workshop, to be held by February 2011 at the latest (see Item 21), is an essential component of this.

10.1.2 Conduct an analysis of aging errors that could be used in catch-at-age analyses

Lockyer presented the results of the Antarctic minke whale ageing exercise (SC/62/IA11) which she had carried out intersessionally following the 'blind' experimental design agreed by the Scientific Committee (IWC, 2009e, p.209). The study was assisted by staff from the laboratory at the Tokyo University of Marine Science and Technology, under the supervision of Kitakado. This had involved reading 250 earplugs from 1974/75-2005/06, i.e. including both Antarctic commercial and JARPA samples. The primary aim of the work was to determine whether evidence exists of a drift in reader performance, and, if so, to quantify it. A secondary aim was to quantify age-reading error variability.

The Committee thanks Lockyer and the Japanese graduate students who had assisted her, and for the professional manner in which they conducted the experiment. It also

[3]CPII and CPIII refer to the second and third set of IWC cruises, referring to 1985/86-1990/91 and 1991/92-2003/04, respectively.

Table 4

Comparison of 'survey-once' estimates of abundance, by Management Area, from the OK and SPLINTR models. Estimates shown have been extracted from the papers SC/62/IA3 and SC/62/IA12 and rounded, with CVs incorporating additional variance given in parentheses.

	Area I	Area II	Area III	Area IV	Area V	Area VI	Total
CPII							
OK	209,000	261,000	187,000	104,000	635,000	90,000	1,486,000
	(0.35)	(0.38)	(0.42)	(0.37)	(0.29)	(0.39)	(0.17)
SPLINTR	117,000	141,000	87,000	61,000	282,000	59,000	747,000
	(0.38)	(0.39)	(0.55)	(0.36)	(0.34)	(0.40)	(0.19)
CPIII							
OK	65,000	93,000	126,000	79,000	244,000	105,000	712,000
	(0.34)	(0.37)	(0.33)	(0.45)	(0.33)	(0.34)	(0.17)
SPLINTR	35,000	56,000	59,000	36,000	140,000	57,000	382,000
	(0.33)	(0.35)	(0.31)	(0.33)	(0.31)	(0.33)	(0.17)

endorses the recommendation by Lockyer that a standard reference set of minke earplugs be maintained for age-reading training purposes.

SC/62/IA2 explored the impact of period/reader on age-determination by comparing age-estimates for the above 250 earplugs for the control reader (Lockyer) and three Japanese readers (Masaki, Kato and Zenitani). Overall, the results demonstrated that the Japanese readers and the control reader differed in terms of both expected age given true age and variance in age-estimates. The results also suggested that the expected age and random uncertainty in age-estimates differed among the Japanese readers although the differences were not severe. This work will assist in determining how catch-at-age data are used in the statistical catch-at-age analyses and in future virtual population analyses.

The Committee **welcomes** this study as an important advance. It was noted that: (a) Lockyer tended to report greater ages than the Japanese readers; (b) differences amongst the Japanese readers were slight; and (c) that there was no indication of a trend in bias in Japanese readings over the period examined (i.e. from commercial whaling to special permit whaling). It was also noted that SC/62/IA11 does not provide any information about the accuracy of the age readings in absolute terms, given the absence of known-aged individuals. The absence of known-aged individuals is also the general norm for fish populations although for a number of these there are indications that layers were formed seasonally. Similarly, studies of fin whales, as well as corpora counts and information from animals with known histories, all indicate that the growth layers groups used to estimate whale ages are laid down annually.

In conclusion, the Committee **agrees** that no further experiments or analyses on age reading errors are needed to resolve ageing related problems raised in e.g. the JARPA review.

The Committee also **recommends** that, where they do not already, national or other guidelines for dealing with stranded animals include encouragement to obtain samples which could provide information on the animal's age.

10.1.3 Continue development of the catch-at-age models

SC/62/IA6 examined the impact of allowing for ageing error based on the analyses of the above (Item 10.1.2) age-reading experiment when conducting assessments for Antarctic minke whales in Areas III-E, IV, V and V-W using statistical catch-at-age analysis by means of sensitivity tests. These sensitivity tests explored three scenarios: (a) no ageing error; (b) ageing error is modelled as in previous base-models; and (c) ageing error is based on the results from SC/62/IA2. Time-trajectories of total (1+) population size and recruitment were qualitatively the same, irrespective of how age-reading error was modelled.

In discussion, it was noted that while estimates from recent years of recruitment and abundance for the three different assessments were close, absolute values showed relatively large differences until the 1960s, and estimation variance would be expected to be much higher over this period.

Though the Committee **agrees** that no further experiments or analyses on age reading errors are necessary. This decision did not, however, imply that other issues associated with the data and analyses, such as reasons for the different length distributions at age for younger-aged commercial and JARPA, had been resolved.

Completion of the work on investigation of catch-at-age based assessments requires undertaking the tasks as detailed in Annex G, item 5.2.4. These investigations will require an extension of permission from Japan for use of their Antarctic minke whale catch-at-age data, and would be improved if data from the most recent JARPA cruises could also be made available. The Committee **recommends** that such an approach be made to Japan under Procedure B of the DAA. Kato indicated that corpora count data were available, and that these data would be provided if necessary. An intersessional steering group under Punt was established to co-ordinate this work (see Annex Q).

10.1.4 Continue to examine the difference between abundance estimates from CPII and CPIII

Estimates from the OK, SPLINTR and standard methods (Branch, 2006) were consistent in that they showed a decline from CPII to CPIII. Conclusions reached about the reasons for these changes should integrate information from other sources such as changes in ice coverage during the survey periods concerned. Until recently, there was little quantitative information on the number of Antarctic minke whales that might be present within the pack ice. This year the Committee was pleased to receive several papers reporting on, and analysing data from, surveys of whales within the pack-ice.

SC/62/IA4 investigated trends of sea ice in the period of IWC IDCR/SOWER circumpolar surveys from CPI to CPIII (1978-2004). The sea ice trends are fundamental information to understand the year-to-year sea ice variability. The authors concluded that the difference in abundance estimates between the CPII and CPIII surveys can be partly explained by the change in the amount of open sea areas within the sea ice field. The Committee **agrees** that further region-specific investigation is necessary to examine the extent of the role changes in sea ice may play in examining the change in abundance estimates between CPII and CPIII. In this context the Committee received a progress report from the intersessional working group established to examine this issue (SC/62/IA5). The authors have made progress importing satellite sea ice data from Area II into a GIS database but the work is not expected to be completed until the next Annual Meeting. The Committee **recommends** that every effort be made to complete this important work on time. Although the exact nature of any models relating minke whales densities in open water to those in the ice was not discussed, it is important to continue investigation of the relationships between whale density and ice characteristics.

This requires investigation of at least: (1) the relationship between whale density and days after sea-ice melt; and (2) the relationship between estimates of abundance and sea ice characteristics. The Committee **agrees** the detailed plan for this work given in Annex G, item 5.1.8. Bravington, Murase, Kitakado and Kelly will co-operate in this work.

This year, the Committee was pleased to receive reports (SC/62/IA8 and SC/62/O15) from two aerial survey programmes: the Australian East Antarctic programme (which co-ordinated in 2009/10 with the SOWER survey) using a fixed wing plane; and the German programme surveying the area in the Weddell Sea from a helicopter launched from the ice breaker vessel, the *Polarstern* (which was also used as a Platform of Opportunity for cetacean sightings). These programmes represent some of the first attempts to gather quantitative data to estimate densities of minke whales in the pack ice. Preliminary analyses from each programme can be found in SC/62/IA9 and SC/62/IA13.

The Committee **welcomes** this work and a full discussion can be found in Annex G, item 5.1.6.2. It thanked the governments of Australia, Germany and the Netherlands for supporting this research. It also was **pleased** to see the successful collaboration (both in collection of data, and in regular communications and data exchanges) between the Australian programme and the SOWER survey.

10.2 Southern Hemisphere humpback whales

The report of the Committee on the assessment of Southern Hemisphere humpback whales is given in Annex H. This assessment has been on the agenda of the Scientific Committee since 1992. The Committee currently recognises seven breeding stocks (BS) in the Southern Hemisphere (labelled A to G - IWC, 1998b), which are connected to feeding grounds in the Antarctic (Fig. 3). Preliminary population modelling of these stocks was initiated in 2000 (IWC, 2001g) and in 2006 (IWC, 2007a), the Scientific Committee completed the assessment of BSA (eastern South America), BSD (western Australia) and BSG (western South America). The assessment of BSC was completed in 2009 (IWC, 2010g). Since then, the completion of the assessment of BSB (western Africa) has been considered a priority by the Committee (IWC, 2010g, p.234).

10.2.1 Breeding Stock B

10.2.1.1 DISTRIBUTION

The Committee received several papers addressing the distribution, new records or habitat use of humpback whales along the central and northern Atlantic coast of Africa (Bamy *et al.*, 2010; Carvalho *et al.*, In review; Picanço *et al.*, 2009; Weir, 2010).

10.2.1.2 POPULATION STRUCTURE

It has been hypothesised that there may be two humpback whale sub-stocks in the eastern South Atlantic (IWC, In press). Breeding sub-stock B1 winters along the central West African coast and around the northern islands of the Gulf of Guinea and sub-stock B2 has been observed off the west coast of South Africa (WSA), in an area which appears to serve as a feeding site or possibly a migratory corridor. The breeding site of sub-stock B2 is unknown. A boundary between these two sub-stocks has been tentatively placed in the vicinity of 18°S (IWC, In press), see Fig. 4. At this meeting, the Committee further evaluated the evidence for BSB substructure, in light of new information.

SC/62/SH30 presented three stock structure hypotheses that were used in the assessment models. These hypotheses included: (1) a single, fully-mixed stock; (2) two breeding stocks that mix only on the feeding grounds and (3) two breeding stocks with partial migratory overlap along the west coast of Africa. SC/62/SH8 described temporal population structure in humpback whales on the west coast of Africa using maternally (mitochondrial DNA control region) and bi-parentally (10 microsatellites) inherited markers. Results showed significant genetic differentiation, low gene flow and

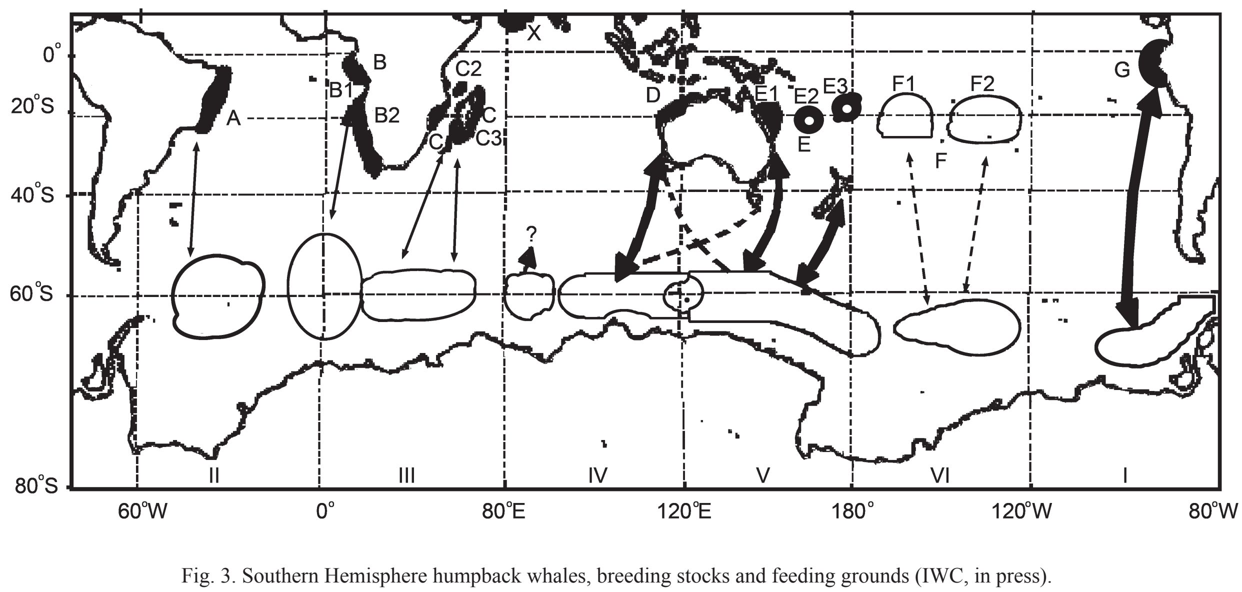

Fig. 3. Southern Hemisphere humpback whales, breeding stocks and feeding grounds (IWC, in press).

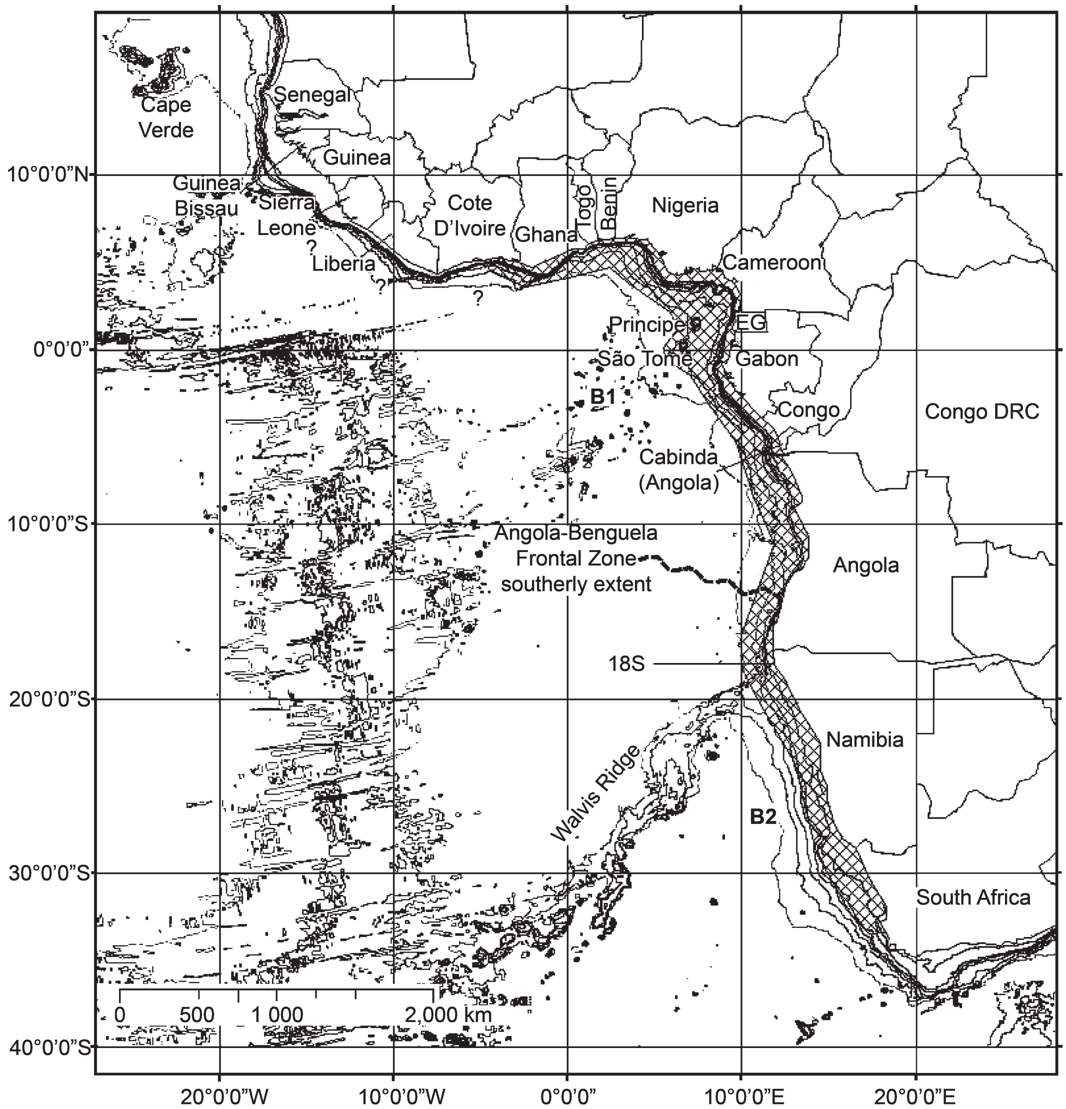

Fig. 4. Distribution of humpback whales in west Africa. The boundary between B1 and B2 has been proposed to be near 18°S (IWC, in press).

seasonal differences between WSA and Gabon. Movements of genetically identified individuals, both males and females, indicate that interchange occurs between these two region, with all movements to date being from north to south.

SC/62/SH15 examined humpback whale genetic structure in the Antarctic and evidence of connectivity to breeding grounds using biopsy samples collected during the 2006/2007 SOWER cruises. An updated analysis of the mitochondrial DNA (mtDNA) data presented in this paper was received during the meeting. Population structure was evaluated for the feeding grounds associated with BSB and BSC, under the catch allocation Hypotheses 1 and 2 developed by the Committee last year (Findlay *et al.*, 2010, fig.1). Under Allocation Hypothesis 1, Gabon was found to be significantly different from the Nucleus feeding areas of both BSB (10°W to 10°E) and BSC (30°E to 60°E). For Allocation Hypothesis 2, samples from Gabon were found to differ significantly from the BSB Nucleus (10°W to 10°E) and BSB/BSC Margin (10°E to 40°E). WSA was significantly different from BSB and BSC Nucleus, as well as the BSB/C margin area. Feeding grounds of BSB and Margin of B/C were found to be significantly different from the Nucleus area associated with BSC under Allocation Hypothesis 1. No significant differentiation was found across feeding areas under Allocation Hypothesis 2.

An analysis of mtDNA on feeding grounds (10°W-10°E) by latitudinal gradient revealed that no significant difference between Gabon and samples collected north of 60°S. WSA differed from samples obtained both north and south of 60°S on the basis of F_{ST} but significance was only found for samples obtained north of 60°S. These results were interpreted as indicative of some type of latitudinal variation in the distribution of whales from BSB in the Antarctic.

The Committee welcomed the genetic studies described above; this research is relevant to the assessments of Southern Hemisphere humpback whale stocks. The Committee **recommends** that a mixed stock analysis be performed to better inform stock structure assumptions and to increase the available data for population dynamics modelling.

The Committee also considered new photo-id matching results relevant to the stock structure of BSB. SC/62/SH10 presented preliminary results of photographic matching between Gabon, WSA and Antarctic Areas II and III. A total of three matches were found between Gabon and WSA. SC/62/

SH31 reported no matches resulted from the comparison of a photo-id catalogue from WSA and another from the south coast of east South Africa and southern Mozambique (BSC1). It was noted that a substantial number of images held by Oceans and Coast (the South African governmental agency from BSC1) have not been compared to WSA. In this regards, the Committee **recommends** comparisons of the WSA fluke photographs to the Oceans and Coast catalogue and **requests** that the relevant photographs and associated information be made available.

Barendse *et al.* (2010) described the results of shore-based observations on humpback whales off Saldanha Bay, WSA. This area was presumed to be a migration corridor for whales from the postulated BSB2 breeding sub-stock. The authors concluded that the area off WSA is not strictly a migration corridor, but also a primary or supplementary feeding ground. Discussion of this paper is given in Annex H, item 2.1.2.

SC/62/SH5 reviewed the catch history, seasonal and temporal trends in availability and the migrations of humpback whales along the west coast of southern Africa. After the initial decline in availability in all areas pre World War I, the catch history in Gabon differed markedly from those in the three southern grounds, especially off South Africa. This suggests some degree of stock sub-structure within BSB. A hypothesis of a single breeding ground (in the Gulf of Guinea) but separate, maternally-directed migratory routes to and from different feeding grounds was proposed.

The Committee concluded that the following points were relevant to the development of stock structure hypotheses based on its extensive review of information:

(1) there is probably more than one genetically distinct humpback whale population in the eastern South Atlantic;
(2) Gabon is a breeding ground and WSA exhibits characteristics of both a feeding ground and a migratory corridor;
(3) at least some of the animals sampled at Gabon migrate to the Antarctic to feed and that migration may follow an inshore route (via WSA), an offshore route or both (if the latter individual migrants maintain fidelity to a particular route or maintain alternate routes);
(4) some of the whales that breed at Gabon may maintain maternal feeding site fidelity to west South Africa, such that they do not migrate to the Antarctic; and
(5) individuals observed at WSA may migrate to an unidentified breeding site that is distinct from Gabon (if so, some fraction of those individuals may pass by Gabon, *en route* to that breeding site) or the breeding ground of these individuals may lie between Gabon and WSA.

In light of the new information presented above, the Committee indentified new stock structure hypotheses and progressed with exploratory population dynamics model runs. Results of these analyses are presented under Item 10.2.1.4 below. A minority statement in relation to item (5) above is found in Annex H, item 2.1.2.

10.2.1.3 ABUNDANCE ESTIMATES

The Committee received two papers with abundance estimates based on capture-recapture data. SC/62/SH2 reported on within-region photo identification and genotypic matching for WSA. Resightings between six different time-periods and five different datasets (three from photo-id data, one from microsatellite data and one combined) resulted in estimates of abundance ranging from 223 (CV=0.35) to 939 (CV=0.38) individuals. SC/62/SH11 presented estimates of abundance for humpback whales in Gabon for the period 2001-06 using photographic and genotypic data. While the estimates themselves provided in this paper were not discussed, the capture-recapture data were used in preliminary assessment models presented at the meeting (SC/62/SH30). Details of these papers and the data therein are presented under item 2.1.3 in Annex H.

10.2.1.4 POPULATION ASSESSMENT

After initial discussion of the assessment models in SC/62/SH30, the Committee developed additional stock structure hypotheses on the basis of the new information presented in Item 10.2.1.2. Additional model runs were then undertaken to inform the Committee about possible implications of various stock structure hypotheses and input data selection for population model outputs. Preliminary results suggested that the assessment model parameter estimates were relatively robust across the proposed stock structure hypotheses and input data for sub-stock B1 (Gabon). However, the population trajectories varied widely for sub-stock B2 (WSA). Based on these results, the Committee concludes that additional modelling was required and **agrees** upon a suite of stock structure hypothesis that would probably be used in the assessment of BSB (Annex H, item 2.1.4). The Committee selected three priority hypotheses that it **recommends** should be used in further population assessment (Fig. 5).

The Committee also discussed model input data and possible sensitivity analysis when evaluating the results of the stock assessment models (details in Annex H, item 2.1.4). Input data included allocation of breeding and feeding ground catches, values for minimum past population sizes (N_{min}), type of capture-recapture data (photo-id, genotype), proportions of whales migrating to breeding and feeding grounds, and rate of struck and lost whales. The Committee **agrees** to a selection of input data to be used as the reference cases and sensitivity scenarios in the population dynamic models, as presented in Table 5.

The Committee **agrees** that considerable progress was made during the meeting. However, there was insufficient time to complete the assessment of BSB. In this regard, the Committee notes that last year it had agreed to complete the assessment of BSB as a single stock if an assessment at the sub-stock level was not possible. However, in light of the new information brought forward this year, the Committee **agrees** that a considerably more robust assessment could be finalised if additional work was conducted intersessionally. The Committee **agrees** that the completion of the assessment of BSB by 2011 is a matter of the highest priority for the sub-committee on other Southern Hemisphere humpback whales. It **strongly recommends** that the strict work plan outlined in Table 6 be followed to facilitate completion at next year's meeting. Regular progress on these tasks will be monitored and reported by Zerbini to an intersessional group (Annex Q). The Committee **recommends** a pre-meeting to the Annual Meeting to ensure the timely completion of this work.

The modelling required to complete the assessment has financial implications for the Committee and this is discussed under Item 24.

The Committee **agrees** that it will conclude the assessment of BSB humpback whales at next year's meeting. Therefore, the Committee **recommends** that assessments of BSE and BSF humpback whales should be initiated and a progress report be presented at SC/63. An intersessional e-mail group was established under Jackson to assemble all the relevant

Table 5

Input data reference cases and sensitivities selected for use in population modelling for the assessment of BSB.

Data category	Population	Reference case	Sensitivity analysis
Capture-recapture	Gabon	Microsatellites, males-only* (see note below)	Flukes; microsatellites (both sexes)
Capture-recapture	WSA	Microsatellites* (see note below)	Right dorsal fin; flukes
Minimum past population	Gabon	$N_{min} = 68$	None
Minimum past population	WSA	$N_{min} = 24$	None
Catch allocation (north of 40°S)	Gabon	Congo and 50% Angola	Congo and Angola; Congo only
Catch allocation (north of 40°S)	WSA	50% Angola, Namibia and WSA	Namibia and WSA; Angola, Namibia and WSA
Catch allocation (south of 40°S)	Gabon	Allocation Hypothesis 1 developed last year	None
Catch allocation (south of 40°S)	WSA	Allocation Hypothesis 1 developed last year	None
Migration to unknown breeding ground	Gabon	25%	None
Migration to Antarctic	WSA	50%	100%; 0% (does not migrate)
Struck and loss rate	Both	0.15 (as presented in SC/62/O2)	0

*Microsatellite data will only be used as a reference case for capture-recapture data if genotyping errors can be incorporated into assessment models. Otherwise flukes will be used.

Table 6

Intersessional tasks to finalise the assessment of BSB humpback whales.

Task	Responsible persons	Final deadlines: Circulation to group for consideration	Final deadlines: Decision regarding use in model
Work on data inputs to model and possible refinements to stock hypotheses			
Inspection of mark-recapture data within and between Gabon and WSA for consideration in stock structure hypothesis refinement.	Barendse and Collins	15/12/10	31/01/11
Investigate and update estimates of potential and realized error in genetic and photo-identification data.	Carvalho, Collins, Rosenbaum, Cerchio	15/12/10	31/01/11
Re-analyse mark-recapture data from WSA using multi-year Program MARK (or equivalent) models to examine the effects of heterogeneity (for fluke data), tag loss (for dorsal fin data) and genotype error on abundance estimates, and assess the most appropriate data on interchange.	Barendse, Cerchio, Best	15/12/10	31/01/11
Conduct feeding-breeding ground mixed-stock analysis in order to estimate stock mixing proportions between Gabon and WSA and the Antarctic in order to further refine stock structure hypotheses for assessments.	Rosenbaum, Carvalho, Loo	15/12/10	31/01/11
Examine catch data for incorporation in population models, which should be sex-disaggregated, if possible.	Best and Butterworth	15/12/10	31/01/11
Comparison of WSA catalogue to South African government Oceans and Coast Catalogue (advantageous but not critical).	Barendse, Findlay and Meyeo	01/12/10	31/01/11
Modelling work			
Development of assessment models consistent with stock structure hypotheses selected by the Committee. Highest priority is for the models in Annex H, table 2. To the extent time permits variants of these models will be considered as sensitivities (Annex H, table 3).	Butterworth, Muller, Johnston	Some initial runs for highest priority stock hypotheses	Final runs for at least highest priority stock hypotheses
The assessment models should use the input data identified as the reference cases and sensitivities in table 2 above. Data output should include the posterior median and the 90% probability interval for the year for which the abundance prior corresponds. Present results for at least highest priority hypotheses.		15/01/10	One week before pre-meeting

data needed for these assessments. The assessment of BSD humpback whales (western Australia) had been completed at the SC meeting in 2005 (IWC, In press), but because of extensive mixing in the feeding grounds with other stocks (e.g. BSE) this stock might needed to be re-assessed along with BSE and BSF. The intersessional group will also consider the inclusion of BSD humpback whales in the assessments of the two other stocks.

The Committee **agrees** that a new item will be added to its agenda to consider new information on the Arabian Sea humpback whale population.

10.2.2 Review new information on other breeding stocks

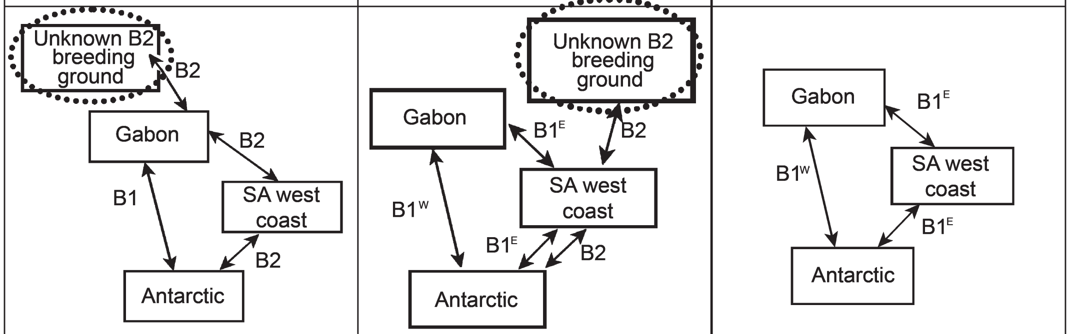
10.2.2.1 BREEDING STOCK A

The Committee welcomed two papers with new information relevant to BSA. SC/62/SH27 reported a photographic match of a female humpback whale between Abrolhos Bank, Brazil (BSA) and the east coast of Madagascar (BSC3), which represents a new mammalian distance record. SC/62/SH28 presented a new line-transect abundance estimate of 9,330 whales (95% CI=7,185-13,214; %CV=16.13) for the coast of Brazil in 2008. This stock appears to be undergoing a steady growth, but further studies are necessary to reduce uncertainties associated with $g(0)$ estimation and other potential sources of bias. Further details are described in Annex H, item 2.2.1.

10.2.2.2 BREEDING STOCK D

Two papers provided information relevant to Breeding Stock D. These are summarised below, with additional details provided in Annex H, item 2.2.2. SC/62/SH21 reported on the deployment of 23 satellite tags on southward migrating whales off Kimberley coast, northwestern Australia. In total, 263 days of location data tracked whales over a total distance of nearly 20,000km. This work has provided the most detailed movement data off northwestern Australia to date and revealed an unexpected 1,200km movement from the coast into the Indian Ocean.

SC/62/SH24 described an unusual peak in recorded mortalities (n=47) of humpback whales in Western Australia



Model Ia	Model IIa	Model III
Model description: model assumes two independent breeding sub-stocks which can mix on Antarctic feeding grounds. Whales from breeding sub-stock B1 feed in the Antarctic and migrate to Gabon for breeding. Whales from breeding sub-stock B2 feed off WSA and migrate along the West African coast through Gabon to a separate unidentified breeding ground. Additionally, some portion of B2 animals migrate to Antarctic feeding grounds. Variants on this model were not considered priority for the assessment of BSB.	*Model description:* model assumes two breeding sub-stocks, B1 and B2. B1 has two migratory components, B1E and B1W. Whales from B1W migrate from Antarctic feeding grounds directly to Gabon while whales from B1E migrate through waters off west South Africa before continuing on to the Gabon breeding grounds. Whales from sub-stock B2 feed primarily off WSA, do not migrate past Gabon and migrate to a separate unidentified breeding area. In addition, some portion of animals from sub-stock B2 migrates to Antarctic feeding grounds. Variants on this model were not considered priority for the assessment of BSB.	*Model description:* model assumes a single breeding stock, B1, with two migratory components B1W and B1E. B1W migrates directly to Gabon from Antarctic feeding grounds while B1E migrates through waters off west South Africa before continuing on to the Gabon breeding grounds. The proportion of animals using each migratory route may change over time.

Fig. 5. Stock structure hypotheses selected as priority for use in the BSB assessment.

in 2009. Only a few mortalities have been reported per year in previous decades. The authors hypothesised that this event could represent:

(1) an artefact of searching effort and coastal oceanography;
(2) a temporary increase in mortality rates; or
(3) the start of an increasing trend in mortality.

They considered the latter two hypotheses to be the most plausible, but noted that additional research would be required to discriminate between them. The Committee noted the importance of continued stranding monitoring to clarify the cause of such unusual events.

10.2.2.3 BREEDING STOCKS E AND F

The Committee welcomed papers on Breeding Stocks E and F and noted these will be relevant for the forthcoming assessment of these stocks. Two papers provided new information on the distribution and habitat use of humpback whales along the east coast of Australia (BSE1).

SC/62/SH21 described results from 13 satellite tags from northward migrating humpback whales off Evans Head, eastern Australia. In total, 371 days of location data tracked whales for nearly 21,000km. The results represent the first detailed movement data of this species in their proposed calving area around the southern Great Barrier Reef.

SC/62/SH25 described the first on-water photo-id study of humpback whales in the Great Barrier Reef Marine Park Cairns/Cooktown Management Area. Thirty percent of the 28 groups observed contained young calves, indicating that this may be an important nursery area for BSE1. Seven individuals were matched to sightings in other areas of east Australia in previous years. Group size, composition, distribution and behaviour were also discussed. Further work is planned and data are available for collaborative research.

Three papers provided new information on the population structure and dynamics of BSE and BSF. SC/61/SH14 presented annual realised growth rates and survival of post-yearling BSE1 humpback whales off New South Wales, Australia (1994-2009). Several caveats were noted and suggestions for further analysis of these data are described in Annex H, item 2.2.2.

SC/62/SH7 reported on a large collaborative comparison of microsatellite genotypes from the migratory corridor along eastern Australia (n=734), the South Pacific Islands (n=1,086) and Antarctic feeding Areas I-VI (n=175). Breeding ground interchange was detected between Eastern Australia-New Caledonia (n=11) and Eastern Australia-Tonga (n=1). The only matches made to feeding grounds were between Eastern Australia and Antarctic Area V (n=3), despite larger sample sizes from Areas IV and VI. The authors concluded that breeding sub-stocks may be mixing on both their breeding and feeding grounds.

They also highlighted the feasibility of this type of collaborative research for studying migratory interchange on a large-scale. SC/62/SH18 reported photographic and genotypic mark-recapture estimates of abundance for humpback whales breeding at the South Pacific Islands (BSE2, BSE3 and BSF) for the period 1999-2003 and concluded that total combined abundance for these breeding stocks likely lies between 2,361 and 3,520 whales. No significant trend in abundance for this population was detected.

Additional details on the discussion of papers on BSE and BSF can be found in Annex H, item 2.2.3.

10.2.2.4 BREEDING STOCK X (ARABIAN SEA POPULATION)

The Committee received two papers with new information on the status of breeding stock (BSX). It had been given this name at a 2006 workshop on Southern Hemisphere humpback whales (IWC, In press). The population is believed to be resident to the Arabian Sea, is currently estimated at 82 individuals (95% CI=60-111) (Minton *et al.*, In press) and recently listed by the IUCN as endangered (Minton *et al.*, 2008). The Committee **agrees** to henceforth call this the Arabian Sea population.

SC/62/SH6 reported on the genetic distinctiveness and current population status of the Arabian Sea population. Genetic analyses based on 11 microsatellite markers and mtDNA sequences revealed significant differentiation between whales sampled off the coast of Oman (n=67), relative to the North Pacific and four Southern Hemisphere regions. Estimated levels of differentiation are among the highest recorded for humpback whale populations worldwide.

It is very unlikely that there is currently any exchange between the Arabian Sea and the Southern Indian Ocean stocks. Tests of population expansion suggest that the population has not yet started recovering and may still be in decline. SC/62/SH20 discussed the anthropogenic threats facing this population and challenges faced in monitoring this endangered population. Baleen whales in this region are potentially vulnerable to impacts from fishing, coastal development, shipping and noise and impacts. At least one live humpback whale entanglement in a gillnet is known to have occurred during the period 2007 and 2009. Research effort has been severely limited in recent years.

The Committee thanked the authors for this new information, noting its **great concern** over the status of this population. The Committee **strongly recommends** the continuation of research on humpback whales in the Arabian Sea in light of the small population size and escalating threats (see also Annex J, item 9.3). It further recognised the difficulty of undertaking such studies for small populations in remote areas.

The Committee also makes the following **recommendations** (in order of priority) for this population:

(1) studies that enable identification and quantification of threats to the Arabian Sea population should be initiated, including an in-depth investigation into the impact of bycatch;
(2) studies and surveys in Oman should be continued and expanded in scope to include more detailed genetic, acoustic and behavioural studies, as well as satellite telemetry studies;
(3) surveys should be encouraged in additional locations in confirmed range countries (Kuwait, India, Iran, Iraq, Oman, Pakistan, Sri Lanka, United Arab Emirates, Yemen), with particular focus on those countries with large coastal regions, such as Pakistan and India - in this regard, abundance surveys should be repeated on a regular basis in order to enable determination of population abundance and trend;
(4) further investigation into humpback whale occurrence in suspected/potential range countries (Bahrain, Maldives, Qatar, Saudi Arabia) should also be conducted; and
(5) studies and surveys to determine the population identity of whales in the Seychelles Exclusive Economic Zone should be performed.

The Committee further noted that given that this is a small population with known anthropogenic threats, it may well benefit from the development of a conservation management plan, following the model for western gray whales described under Item 10.4 and based upon Donovan *et al.* (2008). The Committee **agrees** that this should be explored further, perhaps within the context of conservation management plans being discussed by the IWC Conservation Committee

Further discussion of the Arabian Sea population is found in Annex H, item 2.2.4

10.2.2.5 FEEDING GROUNDS

SC/62/SH3 described a pilot study of cetacean distribution off Adélie Land that was launched by the French Polar Institute (IPEV) as part of the Southern Ocean Research Partnership (SORP). One photo-id match supported a migratory link between BSE and Area V. The Committee **recommends** the continuation of this programme, noting its relevance and utility for the forthcoming assessments of BSE and BSF.

SC/62/O12 presented a preliminary report of a joint Australian-New Zealand Antarctic Whale Expedition. Thirty humpback whales were satellite tagged on the Southern Ocean feeding grounds, and over 60 biopsy skin samples and approximately 60 individual fluke photographs were also collected. The Committee welcomed this research, which will make an important contribution to forthcoming assessments, and **recommends** its continuation. It also **recommends** that photo-id, biopsy sampling and satellite tagging research be conducted in other poorly surveyed areas of the Southern Hemisphere. The Committee **appreciates** the data sharing that has occurred post-expedition; this has been very productive with respect to matches identified with the East Australian breeding region and it **recommends** the continuation of such open collaborations. Finally, the Committee further **recommends** that long-term studies of humpback whales be undertaken and continued in the Southern Hemisphere.

SC/62/SH19 reported molecular genetic species identification of 281 whale bones collected between 2006 and 2007 in South Georgia. The prominence of humpback, fin and blue whale bones correspond to the early catch record in this area. Historical and contemporary humpback whale mtDNA haplotype diversity will be compared to measure the extent of the 'exploitation bottleneck' of stocks around South Georgia. The Committee **welcomes** this work and strongly **encourages** the continuation of bone collection for 'historical' DNA analysis. It further noted that this research will be important for the comparison of historic and current population abundance and diversity.

10.2.2.6 PRELIMINARY MULTI-STOCK ASSESSMENT

SC/62/SH33 reported preliminary results from the development of a population model that aimed to include all seven Southern Hemisphere humpback whale breeding stocks in a single joint assessment, with the purpose of allowing high-latitude historic catches to be allocated to breeding stocks in proportion to abundance, rather than on set ratios. The Committee **encourages** the further development of this model and the presentation of results in future meetings.

10.2.3 Antarctic Humpback Whale Catalogue

SC/62/SH17 described the progress of the Antarctic Humpback Whale Catalogue (AHWC). A total of 899 photographs of 721 individuals were catalogued from Antarctic and Southern Hemisphere waters for the interim period. Images were submitted by 21 individuals and research organisations. These submissions bring the total number of catalogued whales identified by fluke, right dorsal fin/flank and left dorsal fin/flank photographs to 3,665, 413 and 407, respectively. New inter-area matches were as follows: BSG-Antarctic Peninsula (19), BSG-Chile (3), BSA and BSC3 (1; see SC/62/SH27) and BSE-Antarctic Peninsula (2; see Robbins *et al.*, 2008). Re-sightings were also made at the Antarctic Peninsula (3) and within BSG (11). Progress continues to encourage contributions from researchers and eco-tourism. A new on-line catalogue using Flickr is in development and can be viewed at *http://www.flickr.com/ahwc*. The Committee noted the importance of this IWC-supported work and **recommends** its continuation.

10.3 Southern Hemisphere blue whales

In 2002, the Committee recommended that the assessment of blue whales be started in 2005, after the completion of the IDCR/SOWER review (IWC, 2003a, p.41). In 2008, the Scientific Committee completed a circumpolar assessment of Antarctic blue whales (IWC, 2009f) and recommended that area-specific analysis be examined to evaluate whether separate assessments can be done for each IWC Management Area (IWC, 2009f). The Committee also recommended gathering data relevant for the assessment of non-Antarctic (pygmy-type) blue whales. Detailed discussions from this year can be found in Annex H, item 3.

10.3.1 New information

The Committee welcomed new abundance estimates of blue whales off Chile. A new analysis of line transect data collected as part of the 1997/98 SOWER cruise off Chile (Williams *et al.*, 2009b) resulted in an estimate of 303 individuals (95% CI=217-455). Aerial line transect surveys conducted off Isla Chiloé in 2007, 2009 and 2010 resulted in estimates of 97 (CV=0.51), 154 (CV=0.32) and 163 (CV=0.39) individuals, respectively. Further details of these surveys are presented in Annex H, item 3.1.

At last year's meeting, the Committee noted that available line transect estimates probably do not represent the total size of the population(s) present and recommended other approaches be used to estimate blue whale abundance. Progress was reported on the Alfaguara Project's field season off Isla de Chiloe (southern Chile), and particularly its continuing blue whale photo-id research. A preliminary mark-recapture abundance estimate was also presented for pygmy blue whales at the Perth Canyon, Western Australia. Further description of that on-going work is provided in Annex H.

The Committee **recommends** that new or revised estimates of abundance be provided to next year's meeting; specifically from Chile (Galletti and Hucke-Gaete). For Western Australia (Perth Canyon) the level of research necessary to improve the mark recapture data (which is currently very sparse in recaptures) for updated abundance estimates is unlikely to be affordable in the coming year. The Committee also **recommends** that the intersessional e-mail group under Bannister continues to work toward providing new estimates of mark-recapture abundance of blue whales and to report new information at next year's meeting.

The Committee was informed of progress on the development of a cooperative Southern Hemisphere blue whale photo-identification catalogue (SHBWC). Nine groups have joined the SHBWC, including researchers in Chile, the Eastern Tropical Pacific, Australia, Sri Lanka, and Antarctica. Photo-id data from the Japanese Institute for Cetacean Research (ICR) Whale Research Program under special permit in the Antarctic (JARPA 1987/88-2004/05 seasons) has also been submitted to the IWC Secretariat and will be added to the SHBWC through the appropriate data availability channels. The Committee **welcomes** the update on the work of the SHBWC and **recommends** its continuation. It **recommends** that the photographs from the ICR catalogue should be compared to those already held at the Southwest Fisheries Science Center.

SC/62/SH29 reported on archiving and matching of blue whale photographs collected by the IDCR/SOWER cruises between 1987/88 and 2008/09. Over 23,000 photographs were obtained from all six IWC Management Areas, with 219 individual whales identified. Results suggest some degree of residency within a summer feeding season.

The Committee **recommends** that work on the Southern Hemisphere Blue Whale Catalogue (SHBWC) be continued. Over the next two years this will require completion of the matching from the three regions. Budget implications are given under Item 24.

SC/62/SH21 reported on satellite tagging of pygmy blue whales off southwestern Australia. Three tags were deployed (two males, one female) and the whales were tracked for over 8,000km. The tag with greatest longevity (137 days) provided definitive evidence of a link between whales that feed offshore of the Perth Canyon and those that occur around eastern Indonesia, such as the Banda Sea where reports of blue whales appear to be increasing.

The Committee welcomed a number of studies on blue whale acoustics. SC/62/SH26 described the migratory patterns and estimated population sizes of pygmy blue whales traversing the Western Australian coast. An analysis of passive acoustic data estimated that 662-1,559 pygmy blue whales passed the sampling instrument during the 2004 southbound migration. The Committee noted that the acoustic approach to estimating population size reported here represents an important theoretical development, but noted that a number of assumptions of this method needed to be explored in more detail before it could be considered to produce robust estimates of abundance. The Committee also encouraged the continuation of this work.

Gedamke and Robinson (2010) reported the results of an acoustic survey for whales and seals in eastern Antarctic waters (30-80°E) between January and February 2006. Blue whales were the most commonly recorded species identified. They were detected in large concentrations where relatively extensive sea ice remained off the continental shelf and the more eastern waters off the Prydz Bay region. Two detections of pygmy blue whales represent the most southerly recordings of these species.

SC/62/SH13 described results from passive acoustic monitoring for the presence of baleen whales off the coast of Northern Angola, off the Congo River outflow. A series of pygmy blue whale calls were detected by two marine autonomous recording units deployed between March and December 2008, 15km and 24km offshore. This represents the first confirmed modern documentation of this sub-species in Southeast Atlantic waters north of 60°S since the cessation of commercial whaling for blue whales in the region. The calls were of the type attributed to the Sri Lanka population of pygmy blue whales, and not previously recorded outside of the Indian Ocean. Antarctic blue whale calls were not detected. The recording of Sri Lanka pygmy blue whale calls in the Atlantic Ocean was considered to be of great interest.

Progress was reported on a genetic study of Antarctic blue whales, which has been carried out with access to 218 IDCR/SOWER biopsy samples provided by the IWC. More than half of the haplotypes detected thus far have not previously been described. Analysis of the samples is ongoing and the results will be used to estimate the minimum historical population abundance of the Antarctic blue whale. The Committee welcomed this work and **recommends** its continuation. It was observed that this study expands on the haplotype data originally reported by LeDuc *et al.* (2007); the additional haplotypes reported here likely originated from IWC Management Areas II and III (Donovan, 1991), which were under-sampled in the previous study.

The Committee welcomed information on an upcoming study of the global taxonomy of blue whales using mitogenomic and nuclear sequence data. This work aims to conduct a comprehensive genetic assessment of blue whale taxonomy using next-generation sequencing methods to sequence whole mitogenomes and a large number of nuclear regions, for phylogenetic analysis. The project will particularly focus on determining the sub-specific status of blue whales in the North Pacific. The Committee **strongly encourages** continued collaborative efforts to acquire blue whale samples globally, and welcomed further updates on the results of the study

Four blue whale genetic projects are currently in progress: (1) genetics of blue whales in Geographe Bay, Western Australia, as part of a southern Australian study (11 samples collected, 11 analysed and archived, Möller, see SC/62/ProgRepAustralia); (2) a genetic population structure study of blue whales in the southeast and Eastern Tropical Pacific regions (Flores-Torres); (3) a global taxonomy study of blue whales (Lang); and (4) a genetic analysis of the diversity of IDCR/SOWER Antarctic blue whale biopsy samples and South Georgia whalebones (Sremba). The Committee **encourages** continuation of this research and **recommends** that results from these studies be reported when they become available.

10.4 Western North Pacific gray whales (BRG)

10.4.1 New scientific information

Considerable information was presented, and this is discussed in Annex F, item 6.1. Only a brief summary of that work is given here.

In SC/62/BRG11, data generated using a panel of 13 microsatellite loci were combined with updated information from mtDNA control region sequences to further assess the population structure of gray whales in the North Pacific. The results are consistent with the possibility that there may be some dispersal between two populations but that observed genetic differentiation is supportive of two populations.

SC/62/BRG10 presented the results of a paternity analysis conducted on the western gray whale population. The results suggest that some males that contribute to reproduction in this population may not regularly use the primary Sakhalin feeding ground. This highlights the need to collect genetic samples from animals recorded in other areas of the western gray whale's range. The results also provide evidence of interbreeding among animals that show fidelity to the Sakhalin feeding ground.

SC/62/BRG5 presents the first analysis of genetic (mtDNA) data obtained from the gray whales migrating along the Japanese coast (n=6) and incorporated comparison of these with a sample of animals from the Chukotkan hunt in 2008 (n=7). In summary, while recognising the small sample size: (a) all of the mtDNA haplotypes found had been previously reported; (b) the level of genetic diversity within samples was surprisingly high; (c) no genetic heterogeneity in haplotype frequencies was detected between the two samples; and (d) phylogenetic analysis of the haplotypes detected no distinct cluster for the Japanese whales.

The Committee **welcomes** these analyses. It **encourages** the collection of more samples from areas outside Sakhalin feeding ground when they are available and **recommends** a more detailed analysis of samples currently available and a number of suggestions are given in Annex F, item 6.1.

The Committee also received a number of papers on distribution and abundance. A number of points of interest were raised by these papers including:

(1) the potential for western gray whales to reoccupy parts of their former range if the currently small population expands (SC/62/BRG3);
(2) significant annual variation in whale densities among years within the Piltun and offshore feeding areas (SC/62/BRG4);
(3) updated information on an industry-sponsored monitoring programme using photo-id included the movement of animals between Sakhalin and Kamchatka and mother-calf pairs in Olga Bay, Kamchatka (SC/62/BRG9);
(4) updated information from the 2009 collaborative Russia-U.S. research programme (SC/62/BRG6);
(5) comparison of age at sexual maturity in western and eastern gray whales suggesting that the range 6-12 yrs is appropriate for both populations although further data would be welcome (SC/62/BRG2); and
(6) updated information on research and conservation in Japan including information on skeletal studies and an educational programme for fishermen (SC/62/O7).

The Committee **welcomes** all of the new information on this critically endangered population. It **encourages** further work and as in previous years, re-emphasises the importance of continued long-term monitoring. The Committee **recommends** that, if the observed density of gray whales in the Piltun feeding area continues to decline or remains lower than in previous years, future studies should investigate whether this reflects natural variation (e.g. in prey availability), industrial disturbance or some other factors.

Donovan reported on progress with the telemetry programme on western gray whales that has been recommended by the Committee (e.g. see IWC, 2010c). He reported that the programme is progressing and that all involved are grateful to Ilyashenko and his colleagues at IPEE for their work to try to ensure that this project goes ahead, particularly at this stage with respect to the permit issue. An overall administrative and scientific structure has been agreed between the participating institutions and companies, the IWC and IUCN. The scientific steering group is continuing to work on finalising the protocols that will ensure that the IWC Scientific Committee safeguards and guidelines are met as it has been tasked by the Committee; the final protocols will be drawn up in co-operation with IPEE and OSU. IWC, IUCN and the funding companies are also working hard on difficult budgetary issues. It is hoped that it will be possible for the programme to take place this summer.

10.4.2 Conservation advice

The Committee again **recognises** that the problem of net entrapment of western gray whales is a range-wide issue. It **welcomes** the efforts of Japan to reduce mortality, including the educational programme, and notes that net entrapments could occur in other range states. Brownell summarised plans for seismic surveys off Sakhalin Island in 2010. There is concern that anthropogenic sound, especially from seismic surveys, will negatively affect western gray whales in their primary feeding area. Previously, the Commission expressed concern and passed resolutions on this topic. Two seismic surveys in or near the feeding area are planned for 2010. It was noted at the recent meeting of the IUCN Western Gray Whale Advisory Panel that the company (Rosneft) planning the later survey has not followed the same procedures in regard to monitoring and mitigation as the company planning the first survey (by Sakhalin Energy). As currently planned, the Rosneft survey will occur while the highest number of feeding gray whales, including cow and calves, are present. The Committee is **extremely concerned** about the potential impact on western gray whales and **strongly recommends** that Rosneft postpone their survey until at least June 2011 The Committee also **recommends** that Rosneft use monitoring and mitigation measures similar to those used by Sakhalin Energy (see Annex F, Appendix 4), which have been independently reviewed by experts, and that all energy companies operating in the feeding areas of western gray whales should use comprehensive monitoring and mitigation measures to protect western gray whales.

As in previous years, the Committee **acknowledges** the important work of the IUCN Western Gray Whale Advisory Panel (WGWAP). This year's update on the panel's activities is given in Appendix 4 of Annex F. Noting that the WGWAP's present contractual five year life span ends after December 2011, the Committee **re-emphasises** its view that its work is important and should be **continued** if at all possible, and the Committee **requests** the Secretariat to send a letter to IUCN in this regard.

In 2009, the Committee welcomed the report of the IUCN range wide workshop (IUCN, 2009). An important conclusion of that workshop was the need for the development of a conservation plan for western gray whales and this recommendation was endorsed by the Scientific Committee.

This year, the Committee was extremely pleased to receive the first draft of this important Plan (SC/62/BRG24). It **commends** the authors, who include scientists from range states as well as elsewhere, for this important document. The Plan follows the guidelines developed for such plans by Donovan *et al.* (2008) that were endorsed by the Committee (IWC, 2009a). Much of it is based on the report and recommendations of the IUCN rangewide workshop that have also been endorsed by this Committee. The Committee emphasised that the Plan should be supported and endorsed by many stakeholders, including national and local governments, industry, and non-governmental organisations, as well as international organisations such as IWC and IUCN. The overarching goal of the Plan is to reduce mortality related to anthropogenic activities to zero as quickly as possible. The Plan includes 11 focussed actions (related to co-ordination, public awareness, conservation research, monitoring and mitigation) of high importance for the conservation of this critically endangered population. The most immediate, in terms of ensuring the success of the Plan is the appointment of a Steering Committee and of finding funds for and appointing a full-time Co-ordinator. This is also critical to the need, identified by the authors, to engage broad stakeholder participation in the Plan as soon as possible.

The Committee **strongly endorses** this Plan and **commends** it to the Commission and range states. It also **recommends** that it is broadly distributed, including being posted on the IWC and IUCN websites. Consideration is being given to it being published by the *JCRM*. The Committee **recommends** the Plan as a model for the development of other conservation plans for cetacean populations.

10.5 Southern Hemisphere right whales

10.5.1 Australian and New Zealand areas

The Committee received a number of papers on southern right whales from these areas. Details can be found in Annex F, item 5.3. A number of points of interest from these are given below:

(1) genetic comparison of animals around the subantarctic Auckland Islands and the main islands of New Zealand provided documented evidence for the first time of the movement between the two regions and, along with other available data, is most consistent with either the one stock or the extirpation/recolonisation hypotheses (SC/62/BRG16);
(2) results from satellite telemetry provided data on migratory movements of three whales tagged at the Auckland Islands revealed that animals from this nursery area/breeding ground can move north to their feeding ground - the reverse of the generally accepted migratory pattern for southern right whales (SC/62/BRG19);
(3) information on acoustic contact calls from southern right whales near the Auckland Islands (SC/62/E13); and
(4) updated information on long-term aerial survey monitoring programme along the southern Australian coast results in an annual increase rate for cow/calf pairs of around 7.5% (95%CI 3.2, 12.0) for the period 1993-2009 and a minimum population size of 2,530, with a total Australian population of about 3,000.

Difficulties or complications experienced in obtaining permits for biopsy sampling of right whale calves were discussed. Although there were legitimate concerns over possible disturbance to mother-calf pairs, no adverse effect had been shown on subsequent calving interval in a study of the effects of biopsying over 100 cow-calf pairs off South Africa, although the statistical power was low (Best *et al.*, 2005). Given the potential value of such sampling, particularly in establishing issues of paternity the Committee **recommends** that permitting authorities should view requests for biopsy sampling of cow-calf pairs on their scientific merit and apply appropriate safeguards to limit the degree of disturbance where necessary.

10.5.2 South America area

The primary item discussed under this item was the report of a workshop (convened by Brownell) held at the Centro Nacional Patagónico (CENPAT) in Puerto Madryn, Argentina from 15-18 March 2010. The goal of the workshop was to investigate the causes of the high mortality of southern right whales around Península Valdés, Argentina. Participants included experts on the ecology and marine environment of the Península Valdés region, scientists studying right whales in the South Atlantic and international experts on whale strandings and mortality.

Small numbers of strandings have been recorded in the region since 1971. However, since 2003, when the Southern Right Whale Health Monitoring Program (SRWHMP) was established, a total of 366 right whale deaths have been recorded, with peaks in 2003 (31), 2005 (47), 2007 (83), 2008 (95) and 2009 (79). Over 90% of the deaths have been of first-year calves. After investigating thoroughly a range of possible causes for these first year deaths, the workshop agreed three leading hypotheses (it was not possible to determine which was most likely and some combination of factors may have occurred, at least in some years): (1) reduced food availability for adult females; (2) biotoxins; and (3) infectious disease.

The workshop recommended a number of steps to build a better understanding of the cause or causes as listed in Annex F, item 5.3.2.

Of these, continuation of the long-term aerial photo-id programme, other complementary monitoring effort and the SRWHMP are highest priority. The workshop agreed that cooperation and collaboration among research groups is essential for addressing complex questions concerning the die-offs. A western South Atlantic right whale consortium (the North Atlantic right whale consortium) could be used to establish and maintain links among researchers and to share information (this should also include researchers in different parts of the range). Efforts to improve such cooperation and collaboration should be a high priority for local and national governments, NGOs and INGOs.

It was also agreed that the absence of conclusive information regarding the cause(s) of exceptional right whale mortality should not preclude authorities from proceeding with some management measures, particularly in relation to kelp gulls, where gull lesions are clearly harmful to the whales, especially the calves.

The workshop also recognised: (1) the considerable efforts of the researchers in Argentina (and abroad) to investigate the die-offs in the face of fiscal and logistical constraints; and (2) the importance of governmental commitment to the long-term conservation of right whales in Argentina.

The Committee thanked Brownell for his presentation and **endorses** the workshop report. The Committee **welcomes** the announced intention of the Argentine authorities to introduce this year a pilot plan for the control of nuisance gulls.

As in previous years, the Committee **recognises** the value of the long-term photo-id programme of right whales at Península Valdés that had now lasted 40 years, particularly in being able to describe the significance of the recent die-off events and test certain causation hypotheses. It **strongly recommends** its continuation. It also noted that this year emergency funding had been provided by the US Marine Mammal Commission to enable the necropsy programme to take place and strongly **recommends** the continuation of this programme to investigate the reason(s) for the die-off.

The Committee also considered SC/62/BRG15, a preliminary assessment of the genetic structure of the southern right whales from Península Valdés, Argentina. A number of comments to assist in future analyses were raised in discussion (Annex F, item 5.3.2) and the Committee looks forward to an updated analysis next year.

The Committee was pleased to receive information on the 2009 flights of an aerial survey programme off Brazil and it **recommends** the continuation of the surveys.

10.5.3 South Africa area

The Committee was pleased to receive updated information on demographic parameters obtained from the long-term monitoring programme of South Africa (SC/62/BRG30). The results are discussed in Annex F, item 5.3.3 but key features include an annual growth rate of about 7% (95% CI 6.5%, 7.5%); a mean calving interval of about 3.2 years; and a population size in 2006 as about 4,100 animals. SC/62/BRG31 examined the possibility of changes in some demographic parameters for right whales off South Africa through the analysis of re-sighting data for females with calves over the 1979-2006 period. No statistically significant change in adult survival rate or population growth rate was found but a reduction in mean calving interval from 3.2 to 3.1 years was detected.

SC/62/BRG33 reported on the recent announcement of the intention to drill exploratory boreholes for natural gas in eight districts of the coastal region of the southwest coast of South Africa, three of which included nearshore waters that were home to the largest concentration of cow-calf pairs on the African coastline. About 75% of cow-calf pairs on the southern African coast occur in this region in spring, some of which are resident for up to three months, while the westward coastal movement seasonally means that an even larger proportion of the population almost certainly uses the region.

The Committee viewed this potential development with concern, noting the current lack of information available on the proposed activities. It **recommends** to the South African government that all permits issued for exploratory activities should contain mandatory mitigation measures to avoid disturbance to right whales, including confining all marine drilling activity to the season when right whales are absent (January to May). It also **recommends** that if gas production is ultimately planned for the region, the use of closed areas or the development of further mitigation measures such as directional drilling should be considered.

The Committee **endorses** a proposal for the establishment of a Southern Ocean Right Whale Photo-identification Catalogue (the Antarctic Humpback Whale Fluke catalogue). The intention is to provide a resource that could be consulted when researchers holding images taken in coastal waters wished to establish linkages with feeding grounds in pelagic waters (see Appendix 2 of Annex F for detail). It was confirmed in discussion that this would be supplementary to such coastal catalogues. The Committee looks forward to receiving a progress report at its next meeting. Funding is dealt with under Item 24.

10.5.4 Plans to review southern right whales

Brownell reported on progress in preparing for the Southern Right Whale Assessment Meeting, planned to be held at Puerto Madryn, Argentina, in September 2011. Given that this meeting would be held very shortly after next year's IWC meeting a budget would have to be prepared at this meeting (and reserved until 2011). A small group was set up to draw up the budget and draft the Terms of Reference for the meeting (see Annex F, Appendix 3). The Committee **agrees** that this should be funded next year.

10.5.5 Other

The Committee recognises the importance of long-term studies, to provide biological information from photo-id and information on trend and population size from sighting and mark-recapture analyses. It **strongly recommends** the continuation of such long-term studies in relevant areas.

10.6 Other stocks of right whales and small stock of bowhead whales

10.6.1 North Atlantic right whales

An update was provided on North Atlantic right whales for the period May-October 2009, as an addendum to information presented in Pettis (2009). The summary reflects the work of the North Atlantic Right Whale Consortium (NARWC). A shared photographic catalogue was used to produce a 'best' estimate of population size of 438 for 2008. This total did not explicitly account for unphotographed whales in the population and may change slightly as additional data are incorporated into the catalogue. One right whale death was documented during the report period, but the cause was not determined. Additionally, there were three new entanglement cases and eight previous entanglement cases that had not yet been resolved.

The Committee **agrees** that the documented growth in the catalogue plus successive years of improved calf production gave grounds for cautious optimism over the future status of this population. However, while welcoming the management measures that have been taken to date, the Committee **repeats its previous recommendations** on this population that it is **a matter of absolute urgency** that every effort be made to reduce anthropogenic mortality to zero.

10.6.2 North Pacific right whales

SC/62/BRG3 reviewed past sightings of North Pacific right whales off western Kamchatka from spring to autumn. A number of sightings of these whales were made during Japanese-led surveys from 1989 to 2003; these were mostly restricted to the southern portion of study area. However, there were also a few sightings in earlier years by Soviet scientists, including in the northern part of the area. These sightings also highlight the need for directed research and monitoring of right off western Kamchatka in areas overlapping with fishery and oil and gas development activities.

SC/62/NMP22 provided results of observations of North Pacific right whales during the common minke whale sighting and biopsy survey conducted in the Okhotsk Sea in summer 2009. The research area was set north of 46°N, south of 57°N and west of 152°E in the Okhotsk Sea including the Russian EEZ. 17 schools (29 animals) of North Pacific right whales were found, mainly in the offshore waters deeper than 200m. Of these, 16 schools were targeted for photo-id research and 22 animals in 15 schools were individually identified (there are no re-sightings among them).

The Committee welcomes the sighting and photo-id information from these cruises and **encourages** continuing these studies in the area.

Wade *et al.* (2010) used photographic and genotype data to calculate the first mark-recapture estimates of abundance for right whales in the Bering Sea and Aleutian Islands. The estimated abundance data reveal this to be an extremely small population of perhaps around 30 animals. The results will be updated using more samples and images from another survey planned in the eastern North Pacific this year and the Committee looks forward to receiving this information.

Noting the extremely small size of this population, and also the potential for disturbance and ship-strike mortality from greatly increased ship traffic resulting from the likely opening of the northeast or northwest Passages due to sea ice retreat, the Committee considers it **a matter of absolute urgency** that further research be conducted on eastern North Pacific right whales, and **recommends** that this research focus on assessing status and identifying any current sources of anthropogenic mortality.

10.6.3 Small stocks of bowhead whales

SC/62/BRG3 summarised sightings of bowhead whales off western Kamchatka from existing published literature and other available sources. Okhotsk Sea bowhead whales were recorded only a few times in the study area during the spring-autumn period, with one sighting during winter; however it is known from historical whaling data that this species was abundant in the area, particularly in the northern regions during periods of open water.

SC/62/BRG20 reported the results of a survey for bowhead whales conducted in the Fram Strait during 29 March-14 April 2010. Two observations were made, but it was determined based on identifiable scars that both encounters were of the same individual.

Witting reported that 12 sighting of bowhead whales were made in the Northeast Water Polynia off Northeast Greenland during an aerial survey for walrus during August 2009. He also reported that a female with a calf was seen off Norske Island, Northeast Greenland in July 2009. In discussion, it was noted that two passive acoustic recorders were deployed in the Fram Straight during 2008-09 and that these instruments detected numerous bowhead sounds including songs.

The Committee welcomes the above information and **encourages** future updates and research.

10.7 Antarctic cruises

10.7.1 General review of 2009/10 cruise

The planning meeting for the 2009/10 IWC/SOWER cruise was held in Tokyo, Japan in September 2009 (SC/62/Rep6). The cruise took place in Area IV and had two main objectives: (1) to undertake a sightings survey in collaboration with an Australian Antarctic Division aerial survey; and (2) to continue research on the priority species (southern right, blue, fin, and humpback whales). The total number of minke whales sighted in the research area was 83 groups, comprising 152 animals; humpback whales were the most frequently sighted species (174 groups comprising 322 animals). Biopsy samples and individual identification photographs were taken from 21 and 45 humpback whales and 22 and 26 southern right whales, respectively. A total of 28 groups of southern right whales (38 animals) were sighted (SC/62/IA1).

The Committee thanks the Government of Japan for generously providing the vessel and crew for this survey, and also thanks the Cruise Leader for her efforts. Noting that this was the last IDCR/SOWER cruise, the Committee also extended its appreciation to all member nations and researchers who had contributed to this extensive programme, and particularly to the governments of Japan and the former Soviet Union, for providing the survey vessels. The data collected during the programme provide an unparalleled source of information on Antarctic cetaceans. The experience gained from these surveys will continue to be of use in planning future studies, in the Southern Ocean and elsewhere. The Committee **agrees** that a Special Issue of the *JCRM* on the IDCR/SOWER surveys is warranted and re-establishes the working group to progress this idea (see Annex Q).

10.7.2 Plans for cetacean sighting surveys in the Antarctic in the 2010/11 season

SC/62/O17 described a dedicated, systematic cetacean sighting survey which was being planned to take place from December 2010 to February 2011 in order to obtain estimates of abundance for use in the RMP. The research area will be south of 60ºS in Area V and the western part of Area VI (130ºE-145ºW), including the Ross Sea. This survey will be conducted in relation with the Japanese Whale Research Programme under special permit in the Antarctic (JARPA II). Two dedicated, sighting survey vessels, *Shonan-Maru No.2* and *Yushin-maru No.3*, will be used and the survey procedures will be based on the standard

SOWER search modes; closing (NSC) mode and passing with the independent observer (IO) mode.

In order to minimise difficulties associated with survey design, an intersessional Working Group was established under Matsuoka (Annex Q). The Committee **agrees** that Matsuoka is responsible for IWC oversight.

10.8 North Pacific cruises

10.8.1 Recommendations for 2010 cruise and short term objectives

During the last year's Scientific Committee meeting, Japan presented a proposal for a medium- to long-term research programme involving sighting surveys to provide information for cetacean stock management in the North Pacific. The Scientific Committee welcomed the initiative and agreed the value of a large-scale, medium-long term integrated research programme in the North Pacific and encouraged this in the context of international collaboration under IWC auspices.

A meeting to discuss the North Pacific survey programme was held in Japan in September, 2009 (SC/62/Rep3). The meeting agreed four terms of reference:

(1) review the Scientific Committee's issues in the North Pacific;
(2) review the past and ongoing survey activities and available data in range states;
(3) consider possible line transect survey plans and additional data collection (e.g. photo-id and biopsy) for the 2010 season; and
(4) prepare a proposal for an intersessional workshop (to be held between SC/62 and SC/63) on future surveys beyond 2011.

SC/62/IA15 was provided in response to the first term of reference from the meeting and provided a summary of the Scientific Committee issues relating to North Pacific sei, common minke, Bryde's, right and blue whales. The distributions of these whale species were described and requirements for further surveys, in order to estimate abundance and investigate stock structure, were considered.

SC/62/IA10 presented the research plan for an IWC/Japan whale sighting survey taking place in summer 2010. The plan had been drawn up following guidelines agreed at the North Pacific programme intersessional meeting. The research area (170°E-170°W) had been chosen because for some species it spans proposed stock boundaries and has been poorly covered by previous surveys, representing an important information gap for several large whale species. The cruise will collect line transect data to estimate abundance, and biopsy/photo-id data contributing to the work of the Scientific Committee on the management and conservation of populations of large whales in the North Pacific. It will provide:

(1) information for the proposed future in-depth assessment of sei whales in terms of both abundance and stock structure;
(2) information relevant to *Implementation Reviews* (e.g. common minke whales) in terms of both abundance and stock structure;
(3) baseline information on distribution and abundance for a poorly known area for several large whale species/populations, including those that were known to have been depleted in the past but whose status is unclear; and
(4) biopsy samples and photo-id photos to contribute to discussions of stock structure for several large whale species/populations, including those that were known to have been depleted in the past but whose status is unclear.

The cruise will last about 60 days (including transit time) between July and August. In order to adequately cover the longitudinal range, the latitudinal range is restricted between a southern boundary at 40°N and a northern boundary at the Aleutian Islands chain. Four researchers can be accommodated on this cruise; US and Korean scientists will participate. The cruise will follow the requirements for reports and documentation developed for cruises that could provide data for use under the RMP and will be the responsibility of the Japanese scientists.

The Committee thanked the Government of Japan for its generous offer of a vessel for this survey. Matsuoka was assigned responsibility for IWC oversight.

Brownell reported that a scientist from SWFSC had now been identified for the cruise, but major problems regarding CITES permits remain; these issues are similar to those described in SC/62/NPM22 that were encountered between Japan and Russia for the collection of minke whale biopsy samples in the Russian EEZ. There are CITES issues for both inside and outside the US EEZ, because samples collected outside the US EEZ have to enter US waters and then all samples must be exported to Japan. A possible solution (institutional permits) has been proposed to Japan and it is being considered. If these problems are not worked out, it will not be possible to collect any biopsy samples (inside or outside the US EEZ) during this cruise. This would be a major scientific loss to advancing our understanding of the stock structure of baleen whales in the North Pacific, specifically sei whales. The Committee **recognises** the importance of the CITES issue and agreed that it should be resolved among parties concerned expeditiously. The Committee **endorses** the working group's report, and **recommends** that the investigations regarding the use of Institutional permits to exchange biopsy samples proceed as soon as possible, with the results of the investigations being reported to the Planning Meeting scheduled for October 2010.

SC/62/O16 described two sighting surveys for cetaceans, taking place in the North Pacific in 2010, to examine the distribution of sei, Bryde's and minke whales and to estimate abundance for use in the RMP. Both surveys are in the middle part of the Western North Pacific. The main target species are sei and minke whales for the first survey and Bryde's whale for the second survey. The Committee assigned responsibility to Matsuoka for IWC oversight.

10.8.2 Mid- to long-term plans for the North Pacific Survey Programme

In addition to plans for a 2011 cruise, the Committee **recommends** that a coherent multi-year plan be developed for the survey programme in accordance with the discussion given in SC/62/Rep3. A Steering Group to oversee the IWC North Pacific surveys was established under Kato (Annex Q). It was proposed that a meeting of the Steering Group should be scheduled immediately prior to the Planning Meeting for the 2011 cruise, in order to develop the programme of research to be undertaken over the next few years.

10.9 Other

The precise taxonomic relationships and species delineations within the Bryde's/Eden's whale complex are currently uncertain. In South Africa, 'inshore' and 'offshore' forms of Bryde's whale have been described (Best, 1977), and there has been some uncertainty as to whether they should be referred to as *B. edeni* and *B. brydei* respectively. The Committee received a proposal for opportunistic collection of biopsy samples of Bryde's whales during a forthcoming research cruise between the Strait of Gibraltar and Cape Town, South Africa. These samples would be used to facilitate more in-depth genetic analysis of the relationship between the 'offshore' form and other more well sampled Bryde's whale species. The Committee **recommends** this proposal, assuming that relevant permits will be acquired. The Committee also **recommends** that biopsy samples from other whales be obtained, where legally permitted to do so.

11. STOCK DEFINITION (SD)

This Agenda Item was established in 2000, and has been handled since then by a Working Group; see IWC (1999d, p.83) for the original Terms of Reference. The term 'stock' has been used with different meanings in different contexts at different times, both within IWC and in other management and conservation contexts. These multiple meanings have sometimes hindered the Committee's ability to provide management advice. The Working Group was set up to clarify the issue of 'stocks' in a management context (see Item 11.3), to create a bridge between IWC and the expertise of the wider population genetics community (see Items 11.2 and 11.3), to develop software that evaluates the management utility of various population genetic analyses (see Item 11.2), and to develop guidelines for preparation and analysis of genetic data within an IWC context (see Item 11.1). These issues are of fundamental importance to the Committee's discussions on assessments and to the development of management advice. The Report of the Working Group is given as Annex I.

11.1 Statistical and genetic issues related to stock definition

11.1.1 Guidelines on DNA data quality

The Committee has previously endorsed a general set of guidelines for ensuring sufficient quality in genetic data used for management advice (IWC, 2009g; *http://www.iwcoffice.org/sci_com/handbook*). These guidelines constitute a 'living document' that will be updated as necessary. Since the issues involved are complex, the guidelines currently lack any numerical reference points, and the Committee again **encourages** suggestions accordingly. The intersessional e-mail group established in 2008 (Annex Q) was unable to report back this year, but will be continued in the coming year. The item remains on the agenda for the 2011 Annual Meeting.

11.1.2 Guidelines on genetic and statistical analysis

In parallel with the development of data quality guidelines, the Committee is developing guidelines for some of the more common types of statistical analyses of genetic data that are employed in IWC management contexts. These guidelines, which are being developed through another intersessional working group, are at an earlier stage of development than the DNA data quality guidelines. The proposed structure of the document, including a motivating example, was shown last year (IWC, 2009h).

This year, the Committee reviewed a preliminary version of the guidelines (SC/62/SD1), with drafts of several of the sections. Some further work is required, but after one further iteration, the guidelines should be able to appear on the IWC website. Following review of the text so far, a number of suggestions were made for the next iteration, including an 'FAQ' and the possible use of simulated datasets from TOSSM (see Item 11.2) as worked examples. The full list may be found in Annex I. This document will entail a great deal of effort, but should be of lasting importance. It deserves to be published, both online via IWC and in peer-reviewed literature.

11.1.3 Other approaches to stock identification

The Committee has previously considered the utility of acoustic data in questions of stock definition (IWC, 2005e, pp.248-49). Acoustics may be an efficient tool for proposing stock distinctions and boundaries, but interpretation can be difficult unless *inter alia* the stability of individual acoustic behaviour over time is known. This year, paper SC/62/SD2 presented results from acoustic monitoring of fin whales in different seasons and regions of the Mediterranean. The Strait of Gibraltar and Alborán Sea areas experience an influx, during the breeding season only, of fin whales that are acoustically consistent with Icelandic or Norwegian animals, but distinct from other Mediterranean fin whales. The results suggest a possible explanation for the low levels of gene flow that have been found between Mediterranean and North Atlantic fin whale populations. The Committee noted the value of these new data in suggesting rather precise areas where stock mixing and/or separation may occur, and consequently in assisting development of economical sampling design. It **encourages** plans to follow up this study with biopsy sampling.

11.2 TOSSM (Testing of Spatial Structure Models)

The aim of the TOSSM project is to facilitate comparative performance testing of population structure methods intended for use in conservation and management planning. From an IWC perspective, the TOSSM software package allows evaluation of methods for detection of genetic structure, in terms of how well the methods can be used to set spatial boundaries for management. As noted last year, the framework is now complete and the software is available for all to use; simulated datasets exist for three of the five stock-structure archetypes previously proposed by the Committee (IWC, 2009a, p.51). To date, ten methods have been tested on datasets from the two simplest Archetypes (single-stock panmixia, and two populations with limited migration sampled and harvested on the breeding grounds). No new results were received this year. Just as last year, though, the Committee noted the relevance of Archetype IV to North Pacific common minke whale discussions, where program STRUCTURE (Pritchard *et al.*, 2000) is receiving extensive use. It may well be possible to use TOSSM datasets to investigate the likely performance of STRUCTURE in a North Pacific minke whale-like setting, not merely in terms of overall 'boundary setting' but also in terms of specifics such as ability to assign individuals to specific stocks.

Mark-recapture data are another powerful tool for investigating stock issues. These have not yet been considered in TOSSM; next year, the Committee will consider the feasibility of incorporating mark-recapture data into TOSSM datasets. Another potentially powerful tool is the suite of coalescent-based methods but no coalescent-based approaches to boundary-setting have yet been considered in TOSSM. The Committee hopes to consider results of a TOSSM on the coalescent-based software MDIV next year.

There has been much discussion of how to interpret results from the program STRUCTURE, specifically in assigning individuals either to a smaller number of stocks which mix to a different extent in different places, or to a larger number of 'new' stocks that are less mixed. The Committee **encourages** the submission of papers investigating the performance of STRUCTURE for this question, and noted that datasets from TOSSM (existing ones, or new ones if necessary) might be a good starting point for such investigations.

11.3 Unit-to-conserve

'Unit-to-conserve' is a standing item on the SD Working Group agenda. It provides for discussion of potential 'definitions of stock' in a management context, including their operational implications for measurement and management. No new proposals were considered this year.

12. ENVIRONMENTAL CONCERNS (E)

The Commission and the Scientific Committee have increasingly taken an interest in the possible environmental threats to cetaceans. In 1993, the Commission adopted Resolutions on research on the environment and whale stocks and on the preservation of the marine environment (IWC, 1994a; 1994b). A number of resolutions on this topic have been passed subsequently (IWC, 1996a; 1997; 1998a; 1999b; 1999c; 2001c). As a result, the Scientific Committee formalised its work on environmental threats in 1997 by establishing a Standing Working Group that has met every year since then. Its report this year is given as Annex K.

12.1 State of the Cetacean Environment Report (SOCER)

The SOCER aims to provide Commissioners and Scientific Committee members with a non-technical summary of events, developments and conditions in the marine environment relevant to cetaceans. The report is compiled annually, in response to IWC (2001c), with a focus on one pre-selected region each year plus a global section.

The 2010 SOCER was focused on the Arctic and based on peer-reviewed papers published between 2008 and 2010. The overwhelming issue for the Arctic was climate change – e.g. rate of ice loss and ecosystem shifts – but many of the papers in the review period had already been summarized in previous Committee reports because of their global significance. There were few pollutant studies specifically on cetaceans in 2008-10, but the Arctic Monitoring and Assessment Programme (AMAP) 2009 Assessment of Arctic Pollution Status (*http://www.amap.no/*) provides a comprehensive review of pollutant levels in the Arctic. Globally, the environmental issue that received the most attention over the past year was underwater noise, especially disturbance from boat traffic, impacts of sonar on beaked whales and the acoustic impacts of wind farms. Of note, a bibliometric analysis showed that there has been a shift in focus in the cetacean research literature from basic biology topics, which were prevalent in the literature in the 1970s, to conservation topics in recent years. Next year the SOCER will focus on the Southern Ocean.

12.2 Review progress in planning for POLLUTION 2000+, Phase II

The IWC-Pollution 2000+ programme was initiated to investigate pollutant cause-effect relationships in cetaceans, and arose from a Workshop on chemical pollution and cetaceans held in Bergen, Norway in 1995 (Reijnders *et al.,* 1999). Following the Bergen workshop, a planning meeting was held in 1997 (Aguilar *et al.,* 1999a) and a workshop was held in 1999 (Aguilar *et al.*, 1999b), where Phase I of the POLLUTION 2000+ programme was launched. Phase I had two objectives: (1) to select and examine biomarkers for exposure to and/or effects of PCBs; and (2) to validate/calibrate sampling and analytical techniques. The results of Phase I were reviewed and a general framework for POLLUTION 2000+ Phase II was outlined (IWC, 2008a). Discussion for Phase II studies since that time has determined the need to: (1) produce a framework for modelling the effect of pollutants on cetacean populations; (2) identify cetacean populations to be studied under Phase II; and (3) develop a protocol for validating biopsy samples and applying this protocol to any large whale species selected.

Last year, the Committee had proposed the following modified goals for the Phase II programme:

(1) develop an integrated modelling and risk assessment framework to assess cause-effect relationships between pollutants and cetaceans at the population level, building on the progress made during Phase I and on recent research, using modification of a tiered risk assessment paradigm;
(2) extend the work to new species and contaminants as appropriate; and
(3) validate further biopsy sampling techniques for use in addressing issues related to pollution, including legacy contaminants and new contaminants of concern and associated indicators of exposure or effects.

In February 2010, an expert workshop (with expertise in chemical contaminants, toxicology, cetacean biology, veterinary medicine and biomarkers) was held to further develop proposals for Phase II of the programme (SC/62/Rep4). Presentations were made on risk assessment frameworks, chemicals of emerging concern, contaminant exposure, modelling approaches and case studies. Biomarkers of chemical exposure and effects were also discussed, with the workshop purposefully selecting those that have been validated in cetaceans. An international prioritisation survey for chemical contaminants was developed and will be distributed to subject matter experts, with a final report on survey results to be presented at the 2011 IWC Scientific Meeting.

The Committee **endorses** four **recommendations** made at the Workshop:

(1) to improve existing concentration-response (CR) function for PCB-related reproductive effects;
(2) to derive additional CR functions to address other endpoints (i.e., survival) in relation to PCB exposure;
(3) to integrate improved CR components into a population risk model (e.g., individual-based model) for one or more case study species (e.g. bottlenose dolphin and/or humpback whale); and
(4) to develop new biomarkers and improve the linkages between lower and higher levels of organisation (molecular - individual - population). The highest priority for biomarker development should include those with direct relevance to population-level endpoints such as reproduction and survival.

A plan to make progress on Phase II can be found in Annex K. The Committee noted data gaps and research needs identified at the Workshop, specifically noting that progress on this topic will require initiating new studies or additional support of existing efforts

The ICES Working Group on Marine Mammal Ecology (WGMME) met in April 2010 in part to 'Review the current contaminant loads reported in marine mammals in the ICES area, the cause-effect relationships between contaminants and health status, and the population-level effects of environmental impacts.' The SWG had reviewed recommendations made by the WGMME with regard to pollutants in marine mammals (*http://www.ices.dk/reports/ACOM/2010/WGMME/wgmme_final_2010.pdf*). and the Committee **endorses** these recommendations.

The Committee received new information (SC/62/E9) on the development of a suite of sensitive biomarkers from non-lethal sampling to evaluate the toxicological status of Bryde's whale in the Gulf of California. A 'multi-trial-biomarker-tool' was developed, combining protein biomarkers with concentrations of organochlorines and polycyclic aromatic hydrocarbons. A second biomarker study (SC/62/E10) examined a multi-response *in vitro* method to detect toxicological effects of contaminant mixtures on skin samples from cetaceans in the Mediterranean Sea. Preliminary findings indicate that the combination of protein biomarkers, gene expression levels and tissue contaminant levels may be a useful tool in determining 'multiple toxicological stress' in free-ranging cetaceans. The Committee **welcomes** these studies but **emphasises** the importance of standardisation of contaminant concentration reporting.

The Committee received an overview of the oil spill that followed the explosion on board and subsequent loss of the drilling structure 'Deepwater Horizon' on 20 April 2010, approximately 50 miles southeast of Louisiana in the Gulf of Mexico. The incident claimed the lives of 11 workers. Immediately after the spill, response networks for marine mammals, sea turtles, and birds were established, including four facilities for de-oiling of manatees, dolphins, and sea turtles.

As of 4 June, 31 dead dolphins and 277 dead sea turtles had been documented, with numerous accounts of large and small cetaceans seen swimming in oil-contaminated waters. The Committee **commends** all groups that are responding to impacted marine mammals and turtles in the region.

It also **agrees** that it is extremely important to learn as much information as possible from this tragedy in order to accurately assess impacts and be better prepared for potential future oil spills. In this regard, the Committee **strongly recommends** that the government of the USA, range states of the Gulf of Mexico and the responsible parties:

(1) search for and examine as many cetacean carcasses as possible that may have been impacted by the spill through detailed necropsies and thorough tissue sampling;
(2) analyse tissues for contaminants specifically related to spilled oil (i.e. polycyclic aromatic hydrocarbons, dispersants and mixtures of the two);
(3) provide detailed chemical composition of the dispersants that have been used in the Gulf of Mexico;
(4) develop and examine a suite of biomarkers that will be useful for understanding impacts from the spilled oil and use of dispersants in the Gulf of Mexico; and
(5) conduct biomarker studies of cetacean populations in the Gulf of Mexico, especially bottlenose dolphins, sperm whales and Brydes whales.

The situation in the Gulf of Mexico also emphasises the need for adequate environmental baseline data *before* oil and gas exploration, development, or production occurs in any region and for these data to inform mitigation and management decisions. Therefore, for member governments with on-going or planned offshore oil and gas activities within their territories the Committee **strongly recommends** the collection of baseline data to include:

- contaminant levels in cetaceans, their prey, and in sediments, especially polycyclic aromatic hydrocarbons (PAHs) and other contaminants that may interact with PAHs;
- biomarker levels in cetaceans and their prey;
- abundance and distribution of cetaceans and their prey; and
- condition of cetacean habitats (i.e. water quality, sediment quality, etc.).

Finally, the Committee **strongly recommends** contingency planning and training for oil spill responses in areas of oil and gas development. It looks forward to receiving an update on the studies into the effects of this spill at future meetings.

12.3 Review progress of CERD Working Group

The CERD working group was established in response to the report of a workshop on infectious and non-infectious diseases of marine mammals and impact on cetaceans that was held in 2007 (IWC, 2008d). The Committee received an update on its intersessional accomplishments and plans (Annex K, item 8), which are summarised in five categories: (1) skin disease; (2) diagnostic laboratories and veterinary experts; (3) prioritization of pathogens; (4) emergency response; and (5) enhancement of capacity and communications among stranding networks. With regard to the last category, capacity building workshops were held in four regions: West Africa, Caribbean, Brazil and India. Drawing information from the ICES working group and the IWC Ship Strike Working Group, a global inventory of stranding networks has been developed and the CERD working group is developing recommendations to maintain and provide access to the inventory.

The Committee also noted a prioritisation of cetacean pathogens developed on behalf of the US Working Group on Marine Mammal Unusual Mortality Events, from a survey that evaluated 76 pathogens based upon five factors. Of the pathogens included in the survey, most were potentially zoonotic, while others were associated with emerging/re-emerging human diseases in the United States. The ten highest priority pathogens among small cetaceans were morbillivirus, parapoxvirus, *Brucella* spp. anisakis, calicivirus, herpesvirus, nasitrema, *Clostridium* spp., and toxigenic *Escherichia coli*. Although the CERD WG is not tasked to compare cetacean-borne pathogens to those in terrestrial species, the Committee expressed interest in this broader approach, which is consistent with the global *One Health* approach to medicine (*http://onehealthinitiative.com/index.php*). Specifically, *One Health* highlights the importance of integration of surveillance systems in wildlife, domestic animals, public health and environmental health. The Committee **commends** projects that integrate a *One Health* approach to build capacity in countries that are responding to diseases that are shared by people and wildlife. Further, it **recommends** that marine species be considered by all organisation that are implementing the *One Health* approach. Finally, the Committee **commends** the many and varied accomplishments of the CERD WG and **endorses** the work plan for 2011 (Annex K, Appendix 3).

12.4 Review new information on anthropogenic sound: focus on 'masking sound'

The Committee's SWG on environmental concerns has included an item on underwater sound on its agenda each year since 2004 (IWC, 2005f, p.268). In 2009, a presentation on low-frequency 'masking sound' precipitated adopting it as a focal-topic. Low-frequency (LF) ocean noise has increased substantially in recent decades, concomitant with a three-fold increase in commercial shipping and other offshore industrial activities. The Committee reviewed a mechanistic model that dramatically demonstrates the reduction in the 'communication space' of baleen whales that now occurs, especially near shipping lanes and busy ports (Annex K, item 9). It then reviewed a variety of evidence with regard to the masking sound and its possible effects on whales, including: (1) altered calling patterns and frequency in the presence of LF sound from shipping and seismic airguns shown by fin whales in the western Mediterranean Sea and humpback whales off the coast of Northern Angola; (2) chronic exposure of the small population of humpback whales in the Arabian Sea to LF sound from construction, shipping and seismic surveys; and (3) the elevation of LF sound levels at distances from 450 to 2,800km from a seismic survey area south of Tasmania in the Southern Ocean. Based on the aggregate information presented to the SWG with regard to masking sound from anthropogenic sources, the Committee **recommends** that:

(1) seismic surveys be regulated in the same legal frame, whether for scientific or commercial purposes;
(2) baseline data be collected, satisfactorily analysed and modelled using appropriate techniques, regarding the seasonal and spatial distribution of whales in areas of interest to the geophysical community (scientific and commercial) before survey operations;
(3) the masking potential of anthropogenic sources be quantified and acoustic measurements be standardized to ensure that datasets among researchers are comparable; and
(4) in studies examining potential changes in whale acoustic behaviour, the ability to detect whale calls during periods of exposure and non-exposure to anthropogenic LF sound be quantified.

Further, the Committee **strongly recommends** that further research be conducted on the Arabian Sea humpback population (and see Item 10.2.2.4), including studies directed at quantifying the impacts of acoustic disturbance and masking to support conservation planning and protection for this small population.

The SWG had reviewed available information on plans for seismic surveys in support of oil and gas development planned for the Russian Far East, including the Sea of Okhotsk, Anadyr Gulf, the East Siberian and Chukchi Seas (Annex K, item 9.1). The scale of these activities is 'matched' by plans for broad-scale seismic surveys in the US Chukchi and across the US-Canadian Beaufort sea region. At least six endangered whale species (e.g. North Pacific right whales and Okhotsk Sea bowhead whales) occur in low numbers in waters offshore western Kamchatka, where seismic surveys are anticipated during summer 2010.

In light of this, the Committee **recommends** that additional surveys to provide baseline information on cetaceans be conducted in waters off western Kamchatka, and that seismic surveys and other potentially disturbing industrial activities should be conducted during times of lower cetacean abundance in all ocean regions whenever possible (e.g. see the mitigation and monitoring plan for a seismic survey in the Sakhalin region developed under the auspices of IUCN's Western Gray Whale Advisory Panel, and information regarding other seismic survey issues specific to western gray whales under Item 10.4 above). When informed that industry has initiated research into alternative (quieter) technology (vibroseis), the Committee **strongly encourages** this research and **recommends** continued development of such methods.

The conclusions from the workshop on 'Cumulative Impacts of Underwater Noise with Other Anthropogenic Stressors on Marine Mammals' were reviewed (Annex K, item 9.3). That workshop had agreed that cumulative impact assessments (CIAs) are needed to account for sub-lethal effects of human disturbance. The Committee **recommends** that member governments work to develop a quantitative approach for assessing cumulative impacts, including ways that anthropogenic sounds might impact cetaceans and their prey.

In regard to reducing LF sounds from shipping, the SWG (Annex K, item 9.4) had noted rapid progress, especially in the past three years, towards addressing this issue, including both the formation of a Correspondence Group within the Marine Environment Protection Committee (MEPC) of the International Maritime Organization (IMO) and the granting of IMO 'observer status' to the IWC (IWC/62/4). With reference to the IWC's awareness of the critical nature of acoustic communication to whales and that interference, or masking, of this communication is to some extent preventable, the Committee **strongly recommends** that:

(1) the goal of noise reduction from shipping advanced in 2008 (i.e., 3dB in 10 years; 10dB in 30 years in the 10-300Hz band) be actively pursued;
(2) new and retro-fit designs to reduce noise from ship propulsion be advanced within the goals of the IMO, when and wherever practicable; and
(3) the IWC and IMO continue to work collaboratively to advance the goal of worldwide reduction of noise from commercial shipping when and wherever practicable including reporting progress on noise measurements and implementing noise reduction measures.

12.5 Review progress on work from the 2nd Climate Change Workshop

The 2nd Climate Change Workshop (IWC, 2010j) resulted in a series of recommendations summarised under three headings corresponding to working groups established at the workshop: Arctic; Southern Ocean; and Small Cetaceans (and see Annex K, item 10). With regard to the Arctic, three study themes were established: (a) Single Species-Regional Contrast; (b) Trophic Comparison; and (c) Distribution Shift. With reference to theme (a), planning discussions have been completed for a comparison of physical indicators of climate change and available data on population dynamics and behavioural ecology of the Bering-Chukchi-Beaufort Seas and Hudson Bay-Davis Strait populations of bowhead whales. In the Southern Ocean, the SWG was provided an update on the responses of the southern right whale population of Península Valdés, Argentina to climate driven changes on their feeding grounds off South Georgia. As was reported in the Southern Right Whale Die-Off Workshop (SC/62/Rep1 and see Item 10.5 above), one of three possible hypotheses to explain recent peaks in calf mortalities is a decline in food availability for adult females on their feeding ground during the year or two prior to calving. This hypothesis will be explored by updating an analysis on the relationship between changes in sea surface temperature and calving success. The Committee reviewed a draft agenda for a Small Cetaceans and Climate Change Workshop planned for November 2010, where the main focus will be: (1) restricted habitats – estuaries, reefs, environmental discontinuities, rivers and shallow waters; and (2) range changes – i.e. evidence of changes in distributions, reasons and consequences; and (3) with a review planned for small cetaceans in the Arctic Region and suggested that the definition of restricted habitat be broadened (Annex K, item 10). Noting that last year the Committee had recommended that countries should pay more attention to tertiary concerns arising from climate change, the Committee noted that Alter *et al.* (2010) provide arguments suggesting that tropical, coastal and riverine cetaceans are particularly vulnerable to those aspects of climate change that are mediated by changes in human behaviour.

12.6 Other habitat related issues

There has been a rapid expansion of marine renewable energy devices (MREDs) in European seas as governments strive to meet renewable energy commitments. Today there are some 89 such sites in various stages of development (most of these are wind farms), representing a five-fold increase in numbers since 2000, with a concomitant major increase in the size of planned developments. The SWG reviewed concerns associated with the construction, operation, maintenance and (ultimately) decommissioning of wind, tidal and wave renewable energy technologies (Annex K, item 11.1) and the Committee **strongly recommends** that countries co-operate to limit impacts on marine wildlife from these sources. The SWG subsequently discussed the ICES WGMME recommendations with regard to the effects of wind farm construction and operation on marine mammals (Annex K, item 11.1) and the Committee **endorses** those recommendations.

The French Agency for Marine Protected Areas (AAMP) has initiated the REMMOA project, a series of surveys across the French EEZ to identify hotspots of abundance and diversity. Extensive surveys have been conducted across the EEZ of Martinique and Guadeloupe, off Guiana and in the southwest Indian Ocean region. The South Pacific regions will be surveyed during 2010-11 (French Polynesia) and 2011-12 (southwest Pacific Ocean around New Caledonia and Wallis and Futuna) and the Atlantic survey is planned for 2012-13. The Committee also received information on systematic monitoring of density and abundance of the most common cetacean species of the Pelagos Sanctuary and in the seas surrounding Italy. The aim of this work, funded by the Italian Government, is to inform conservation measures throughout the Mediterranean Basin. It also responds to priority actions in a number of other international bodies (e.g. the Sanctuary Management Plan, ACCOBAMS, the Specially Protected Areas and Biodiversity Protocol under the Barcelona Convention, the EU Habitat Directive and the Convention on Biological Diversity). The Committee **commends** both of these studies and encourages their continuation. It noted the impressive advancements of current methods giving the authors the ability to correlate cetaceans with specific habitat features as well as other megafauna.

Finally, there has been limited progress since the update on the Madagascar Mass Stranding Event (MMSE) given in 2008 (IWC, 2009a, p.71). Two potential scenarios to move forward with an Independent Scientific Review Panel (ISRP) were identified: (1) a National Office of the Environment (ONE) to request and oversee an ISRP; or (2) the Environmental Governance Commission to serve as an intermediary body between the Government and/or ONE to promote the need for an ISRP to assess the results of the MMSE. The Committee welcomed this update and thanked The Wildlife Conservation Society and its partners' continuing efforts to bring the results of the MMSE to an appropriate conclusion through an ISRP process, as well as keeping the SWG updated on the current challenges and progress.

13. ECOSYSTEM MODELLING

The Ecosystem Modelling Working Group was first convened in 2007 (IWC, 2008c). It is tasked with informing the Committee on relevant aspects of the nature and extent of the ecological relationships between whales and the ecosystems in which they live. This advice is important to other responsibilities of the Committee: it can be used to simulate an ecosystem framework in which to evaluate management strategies; it can provide a bio-physical context within which to try to understand spatial or temporal (e.g. interannual, interdecadal, or long-term climate-driven) variability in cetacean population dynamics, distribution, behaviour, and health; it can provide insight into interactions between whales and fisheries; and it may inform the prioritisation and design of future IWC research projects by identifying critical information gaps and offering recommendations of when, where and how field efforts should be conducted to successfully collect new data that are necessary for providing insight into key questions. The Commission has stated their interest in such work in a number of resolutions (IWC, 1999a; 2001c; 2002a). Each year the Working Group reviews the progress in developing ecosystem models relevant to the work of the IWC, which is a broad task encompassing the evaluation of model inputs, assumptions, structure and outputs. In addition, the Working Group has placed a priority on discussions and collaborations with institutions outside of the IWC to facilitate the exchange of information on the state of the science of ecosystem modelling and, where applicable, to collaborate to achieve a common goal. No primary ecosystem modelling papers were received this year, so the Working Group dedicated its time to three general tasks: (1) reviewing ecosystem models and modelling approaches that were developed outside of the IWC; (2) learning about the Climate Impacts on Oceanic Top Predators (CLIOTOP) project; and (3) discussing and planning the future role of this Working Group within the Scientific Committee. The report of the Working Group is given as Annex K1.

13.1 Review ecosystem models relevant to the Committee's work

This year, Lehodey introduced the CLIOTOP project and in particular the ecosystem model that he and his colleagues developed to analyse and predict the spatio-temporal dynamics of tuna populations under the influence of environmental and fishing pressures (Lehodey *et al.*, 2008). The model has been applied to skipjack, bigeye, yellowfin and albacore tuna in the Pacific Ocean (Lehodey and Senina, 2009) and also been used to investigate potential influences of climate change on tuna population dynamics (Lehodey *et al.*, 2010).

CLIOTOP is a global project implemented under two International Geosphere-Biosphere Programme (IGBP) international research programmes: Global Ocean Ecosystem Dynamics (GLOBEC) and Integrated Marine Biogeochemistry and Ecosystem Research (IMBER). Its general objective is to enhance the understanding of oceanic top predators in their ecosystems in the context of both climate change and fishing, and to develop new tools leading to the evaluation of management strategies. CLIOTOP and the IWC share many common scientific interests, including: studying the behaviour, movement patterns and habitat of large predators; developing and applying technology for animal tracking; estimating food consumption rates; understanding and modeling predation by, and competition among, large predators; modelling and acoustic monitoring of prey fields; investigating various approaches to ecosystem modelling; and addressing issues of bycatch. The Committee **encourages** the establishment of collaborations between the IWC and CLIOTOP.

As part of its remit to preview general developments in ecosystem modelling to identify new modelling approaches and develop an evaluation framework that may be of benefit to the Committee's work, four recently published papers were reviewed (A'Mar *et al.*, 2009; Allen and Fulton, 2010; Buckley and Buckley, 2010; Hannah *et al.*, 2010). These covered issues of model structure, assumptions, complexity and validation. In discussion, it was noted that some existing research suggests that management strategies relying on empirical data through fisheries statistics performed better than those that incorporated ecological information; however, ecological data are valuable for constructing and constraining the range of ecosystem models that could be used to evaluate management strategies within the Scientific Committee.

13.2 Recommendations on the role of this Working Group within the Committee

SC/62/EM1 motivated discussions about the future of the Ecosystem Modelling Working Group. It provided background into the initial objectives and the history of the Working Group; reiterated the distinction between 'tactical' models (those used to set catch limits or to make other management advice) and 'strategic' models (those used to simulate an environment in which to test simpler models); listed some of the ecological and analytical issues that have been recurrent in Committee discussions to date; and introduced several recommendations to help the Committee evaluate ecosystem models, given the numerous uncertainties inherent in the modelling process. As did the Working Group, the Committee **agrees** to the following recommendations, based on those in SC/62/EM1:

(1) standardised templates should be developed for documenting metadata and analytical techniques;
(2) performance criteria should be established, including testing model fit to historic or present data and assessing its ability to generate ecologically reasonable predictions into the future;
(3) sensitivity analyses should be conducted to quantify and provide insight into the importance of model inputs (which can guide data collection priorities) and assumptions on model outputs;
(4) Scientific Committee members should be given access to relevant background information (such as the full mathematical specification) used in any presented ecosystem models that may inform management decisions (via the Secretariat);
(5) the Scientific Committee should explore various ecosystem modelling approaches for a system in order to compare performance across models;
(6) intersessional meetings should be used, when necessary, to allow in-depth examination of competing models; and
(7) the EM Working Group should continue to convene every year at the annual meetings to address issues relevant to the Scientific Committee and to remain informed about new developments in the ecosystem modelling field.

The Committee **emphasises** that the Working Group is an important forum for evaluating ecosystem model inputs, structure, assumptions and predictions related to its work. *Inter alia*, it is also the appropriate sub-group within the Committee for reviewing the ecosystem aspects of ongoing special permit whaling programmes.

The Committee **recognises** the need to involve outside experts in the Working Group. Work is underway to establish an avenue for exchanging information about new developments in ecosystem modelling and its feedback into management, and to solicit feedback on how ecosystem models could inform IWC management decisions.

The Committee **agrees** that the activities of the Working Group should be structured around the timetable of RMP assessments and *Implementations*, enabling ecosystem models relevant to a specific stock being assessed to be reviewed prior to the assessment; the North Pacific is the appropriate region for 2011. The Working Group will take efforts during the intersessional period to engage researchers involved in the North Pacific Marine Science Organization (PICES) and the North Pacific Research Board (NPRB) to collaborate on primary papers for next year's meeting on how North Pacific ecosystem models can be used to inform the RMP process. Two additional issues were highlighted for discussion next year, if primary papers can be prepared in advance. One is a review of functional responses, and the second is a review of methods for evaluating ecosystem models. It is expected that the latter will result in a framework that the Committee will use to guide future ecosystem model evaluations, providing model developers specific details regarding the information required to determine whether the input data and parameters, the model and the resulting predictions should be considered acceptable to inform the work of the Committee.

13.3 Work plan

The work plan is detailed under Item 24. The Working Group requests no funds for the upcoming year.

14. SMALL CETACEANS (SM)

The Committee has been discussing issues related to small cetaceans since the mid-1970s (IWC, 1976). Despite the differences of views over competency (IWC, 1993), the Commission has agreed that the Committee should continue to consider this item (IWC, 1995c). The report of the sub-committee on small cetaceans is given as Annex L.

14.1 Review taxonomy, population structure and status of small cetaceans of northwestern Africa and the Eastern Tropical Atlantic (ETA)

The priority topic this year was the review of the status of small cetaceans of northwestern African and eastern tropical Atlantic waters (Fig. 6), a region with a variety of ecosystems and coastal habitats. The review was greatly assisted by the availability of published review papers and documents prepared for this meeting by scientists working in Canary Islands (Spain), Mauritania, Cape Verde, Guinea, Ghana, Togo, Benin, Nigeria, São Tomé and Príncipe, Cameroon, Gabon, Congo and Angola.

The following sections represent a short summary of the extensive review. Details can be found in Annex L.

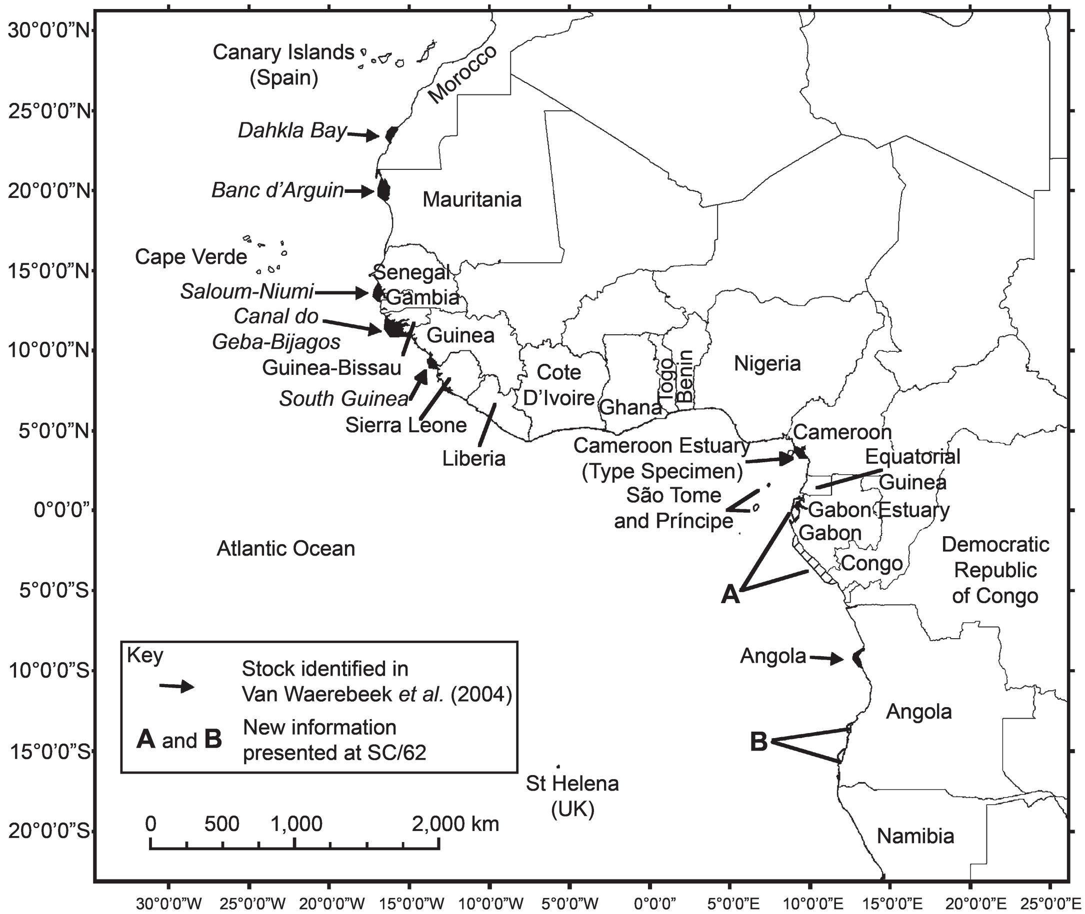


Fig. 6. Map of the northwestern and western African countries relevant to the cetacean distribution review. A=Information from SC/62/SM9. B=Information from SC/62/SM6.

Weir (2010) reviewed cetacean occurrence (sightings, strandings, direct captures, bycatch) in West African waters from the Gulf of Guinea to Angola, updating Jefferson *et al.* (1997). At least 21 odontocetes (including at least 17 delphinids) have been documented in the region. The author stressed that the region's cetaceans face several threats including bycatch, direct capture (e.g. in Ghana and Togo) and threats to them and their habitat, e.g. due to oil and gas development. Moore *et al.* (2010) reported information on cetacean bycatch from interview surveys in 2007 and 2008 in fishing communities of seven countries: Sierra Leone, Cameroon, Nigeria, Tanzania, Comoros, Malaysia and Jamaica They provided information on reported cetacean bycatches in Sierra Leone and Cameroon.

Further information on the region's cetaceans came from a number of papers focussing on country reports.

SC/62/SM9 reviewed recent information on Atlantic humpback dolphins in Gabon and Republic of Congo. Both countries have large and diverse national park systems that include protected coastal habitat. Given the low human population densities and the extent of relatively undisturbed habitat in Gabon and northern Congo, this region may represent a stronghold for the species. However, bycatch and evidence of dolphins in the bushmeat trade give cause for concern, particularly as the demand for fish in cities increases. The Committee commends the authors for their efforts in the region and **recommends** that research, monitoring and conservation efforts for humpback dolphins along the coast of Gabon and Congo continue.

The Committee received two papers covering Nigeria (SC/62/SM12 and SM1). Cetaceans occur throughout Nigerian coastal waters in the Gulf of Guinea, although there has been little directed cetacean research. Potential threats include: bycatches (a reported zero bycatch rate for Nigeria obtained in an interview survey by Moore *et al.* (2010) is not credible, probably due to low sample size); direct catches of delphinids (SC/62/SM1) for sale as 'marine bushmeat' (Clapham and van Waerebeek, 2007) which may be widespread; and habitat degradation (e.g. uncontrolled trawling operations, indiscriminate dumping of non-biodegradable nylon and plastic products and household items). The absence of monitoring may explain the lack of detailed information on direct catches. SC/62/SM1 reiterated the suggestion by Van Waerebeek *et al.* (2004) that Atlantic humpback dolphins inhabited the Niger Delta before large-scale oil exploration and extraction altered the coastal environment.

Information on Ghana was provided in SC/62/SM10 with an emphasis on the captures of small cetaceans in artisanal fisheries, mainly using drift gill nets. Cetaceans have been documented from three fish landing ports since 1995 but these landings do not represent the total for the country. It is often unclear if 'bycaught' cetaceans in Ghana are the result of unintentional or intentional taking. The species most frequently 'bycaught' are the clymene dolphin (24.5%), pantropical spotted dolphin (12.3%) and common bottlenose dolphin (12.3%). SC/62/SM10 suggested an increasing trend in the scale of landings between 1999 and 2010, and particularly since 2002-03. Once the practice of catching and marketing cetacean products becomes established, it can escalate rapidly as implied in the existing catch series. Although aquatic mammals are protected by law, there are no explicit regulations concerning the use of cetaceans killed in nets and the use of dolphin meat as bait in shark fisheries and for human consumption is not considered illegal. This means that catches are not concealed for fear of sanctions and therefore catch statistics can be obtained. This makes it feasible to study trends and carry out biological studies based on carcass sampling protocols.

As stated in SC/62/SM10, traditional taboos against catching dolphins are rapidly eroding in the Volta Delta region. This seems to happen in some areas of Nigeria as well. One important development is that the monetary value of a small cetacean is now roughly equivalent to that of a similar-sized large billfish. In fact, more money can be earned by selling the cetacean carcasses for shark bait as the export market in Asia for shark fins is lucrative and growing.

The Committee thanks the researchers working in Ghana for their efforts and notes that the evidently close cooperation with fisheries officials is encouraging.

Tchibozo summarised the current knowledge on small cetaceans along the 124km coastline of Benin (Tchibozo and van Waerebeek, 2007). The presence of four species has been confirmed: Atlantic spotted dolphins, common bottlenose dolphins, false killer whales and *Delphinus* sp. There have been no systematic studies on the distribution, abundance or ecology of small cetaceans in Benin. Although bycatch of cetaceans is known to occur in fisheries along the entire coast, no monitoring programme is in place.

SC/62/SM11 confirmed the presence of four small cetaceans in Togo's coastal waters: pantropical spotted dolphins, common dolphins, pilot whales and killer whales. However, there is no information concerning abundance, natural history or ecology. The main potential threats are:

(1) bycatch in fisheries, with the possibility that this has led or soon will lead to directed taking as has been observed elsewhere; and
(2) severe chemical pollution due to the mining of phosphorites and discharge of phosphate-rich mud into coastal waters.

Bamy *et al.* (2010) reported that four odontocetes occur along Guinea's 300km coastline: common bottlenose dolphins, Atlantic humpback dolphins, Atlantic spotted dolphins and pygmy sperm whales. It is probable that short-finned pilot whales, rough-toothed dolphins and common dolphins also occur there. This information comes mainly from observations during irregular, largely opportunistic surveys of fishing communities in 2001-03 by personnel from Guinea's Centre National des Sciences Halieutiques de Boussoura (CNSHB). There is no evidence of substantial directed or incidental takes (e.g. at the scale reported in Ghana) but monitoring and reporting have been limited. There is evidence that bycaught small cetaceans and a stranded whale were used for human consumption. The authors expressed concern about even occasional catches of Atlantic humpback dolphins.

During discussion, reference was made to the study by Brashares *et al.* (2004) on the relation between declining fish supplies in West African waters and the increase in hunting for 'bushmeat' and consequent declines in wildlife populations.

SC/62/SM8 updated Picanço *et al.* (2009) with information on small cetaceans off São Tomé and Príncipe. At least four species of small cetaceans are known to occur there with the common bottlenose dolphin and pantropical spotted dolphin being the most numerous.

Several species of small cetaceans were hunted historically in the Cape Verde Islands using hand harpoons. Despite protective legislation, cetaceans are still captured occasionally and their meat is sold and consumed (Hazevoet and Wenzel, 2000; Reiner *et al.*, 1996).

Vely summarised cetacean occurrence in Mauritania between 1987-95 based on dedicated surveys in two main areas: (a) between the southern border with Senegal and the village of Nouamghar at the northern entrance of the National Park of Banc d'Arguin (PNBA); and (b) within the PNBA. Species observed at sea were common bottlenose dolphins, Atlantic humpback dolphins and killer whales. Stranded specimens included harbour porpoises, clymene dolphins, common dolphins, Risso's dolphins, melon-headed whales, short-finned pilot whales, pygmy sperm whales, dwarf sperm whales and Cuvier's and Gervais' beaked whales.

Smit *et al.* (2010) summarised information on the presence and distribution of small cetaceans off the coast of La Gomera (Canary Islands), where a total of 21 species were observed at sea. The five most abundant species (87% of sightings) were common bottlenose dolphins, short-finned pilot whales, Atlantic spotted dolphins, short-beaked common dolphins and rough-toothed dolphins.

The Committee thanks all of the contributors but noted that its review was characterised by rather scarce information from the northwest African countries (see Annex L). However, enough new information was available from West Africa to update and make some corrections to the existing state of knowledge on cetaceans along the west African coast (see table 1 of Annex L).

IUCN Red List status for 21 out of 22 species is either Least Concern or Data Deficient (2008). The Atlantic humpback dolphin is listed as Vulnerable. There is a general lack of relevant information on many of the species, not only for western African waters but also globally, on taxonomy, population structure, abundance, life history and ecology.

The scarcity of information prevented the Committee from being able to make a reliable evaluation of the status of any of the species in the region. That being said, the information available in the review showed that nearly all species are taken either intentionally or unintentionally (SC/62/SM1, SM10 and SM11; see also Bamy *et al.*, 2010; Van Waerebeek *et al.*, 2008; and Weir, 2010). Especially for one species, the clymene dolphin, the Committee **expresses serious concern** about the ongoing observed landings in Ghana.

The Committee then reviewed two species on which there was a little more information.

Killer whales

Killer whales observed off Angola, Gabon and São Tomé were similar in external appearance to, and their appearance was consistent with, the Type A 'nominate' killer whale form described by Pitman and Ensor (2003). Weir *et al.* (2010) summarised published records from Liberia, Côte d'Ivoire, Ghana, Annobón Island (Equatorial Guinea) and Gabon as well as 31 sightings from Angola, Gabon and São Tomé, and a single record from Cameroon. De Boer (2010) provided an additional record of killer whales in the offshore waters of Gabon. Most sightings have been recorded since 2001, corresponding with the onset of dedicated survey work in the region. Bamy *et al.* (2010) found no confirmed records for the stretch of coast from southern Senegal (Casamance) to Liberia. They also questioned whether killer whales venture into the shallow waters of Guinea-Bissau, Guinea and Sierra Leone.

No information was received regarding recent intentional takes although one killer whale was recorded as landed in Ghana between 1998 and 2000 (SC/62/SM8).

The killer whale can be considered a regular component of the cetacean community off Angola and in the Gulf of Guinea. However, more survey work is required throughout the region to clarify its status and biology off tropical West Africa (Weir *et al.*, 2010). The IUCN Red List status of the species is Data Deficient.

Atlantic humpback dolphin

The Atlantic humpback dolphin - an endemic species for this region - was a priority species in 2002 (IWC, 2003b) but at that time the review focused on the Indo-Pacific humpback dolphin.

The taxonomy of the genus *Sousa* remains largely unresolved. Although three putative or nominal species have been widely discussed (*chinensis*, *plumbea* and *teuszii*), the IWC presently recognises only two, the Atlantic species *S. teuszii* and a geographically widespread Indo-Pacific species *S. chinensis*. Although the Committee was informed by Rosenbaum of a collaborative study to clarify the taxonomy of *Sousa*, the Committee **agrees** to retain its present nomenclature until formal publication of this information. It also **recommends** that samples from *S. teuszii* be provided to Rosenbaum as soon as possible so that they can be included in the ongoing efforts described above, which are essential for resolving questions questions concerning taxonomy and population structure.

Van Waerebeek *et al.* (2004) reviewed the state of knowledge on Atlantic humpback dolphins and proposed eight provisional management stocks based on the fragmentary information available to them. Six were confirmed as extant based on recent records: Dakhla Bay (Western Sahara), Banc d'Arguin (Mauritania), Saloum-Niumi (Senegal, Gambia), Canal do Gêba-Bijagos (Guinea-Bissau), South Guinea and Angola. The other two – Cameroon Estuary and Gabon – were considered historical. Those authors also noted the 'potential existence' of a western Togo stock. They concluded that there were nine confirmed range states: Morocco (including Western Sahara), Mauritania, Senegal, The Gambia, Guinea-Bissau, Guinea-Conakry, Cameroon, Gabon and Angola.

Van Waerebeek *et al.* (2004) stated that the species was limited to tropical and subtropical waters very near shore from Western Sahara in the north to Angola in the south; the distribution is patchy and limited to particular stretches of coastline separated by gaps of absence or very low density. In many cases, it was unclear whether the absence of records from an area means the species naturally does not occur there, or it has been extirpated in the area, or search effort and reporting have been insufficient.

Bamy *et al.* (2010) considered as uncertain the degree of distributional continuity and gene flow between the provisionally defined 'South Guinea stock' and other provisionally defined stocks (Van Waerebeek *et al.*, 2004). As in Guinea-Bissau, most of Guinea's coastline has features suitable as humpback dolphin habitat: warm and shallow waters on a shelf extending up to 200km from shore, with extensive mangrove creeks around four main river mouths. The lack of sighting records is probably partly due to the small amount of near-shore survey effort. Ghana represents a confirmed gap (SC/62/SM10).

Although much remains unknown about distribution and the extent to which it has changed over time as a result of human activities (e.g. bycatch, habitat degradation), current understanding is that there are regional pockets of relatively high density, such as in Senegal-The Gambia-Guinea-Bissau-Guinea-Sierra Leone, Gabon-Congo and Cameroon-Angola-Namibia.

Although its typical habitat was thought to be shallow coastal waters, especially estuaries, mangrove systems and sheltered bays (Van Waerebeek *et al.*, 2004), new information on the presence, distribution and behaviour of Atlantic humpback dolphins was received from Flamingos (southern Angola), Gabon and Congo (SC/62/SM9), also see Weir *et al.* (2009). In Gabon, Congo and elsewhere in the southern range of the species, humpback dolphins are regularly observed on open coastlines.

The loss and fragmentation of habitat due to expanding coastal communities, coastal development, dredging, trawling, deforestation, mangrove destruction, pollution, eutrophication and oil spills also threaten this species. Its preference in many areas for shallow, nearshore and estuarine habitat would render it particularly vulnerable to ubiquitous inshore set gillnets, beach seines and disturbance.

The Committee **agrees** that there is ample evidence for serious concern about the conservation status of this species (SC/62/SM1; SM6; SM9-SM11, and see also Bamy *et al.*, 2010). Although quantitative data or even good qualitative data (e.g. confirmation of species presence/absence) are lacking for much of the known or suspected range, the information available from areas where cetaceans have been consistently studied (e.g. Ghana, Guinea) indicates that the overall population is fragmented, bycatch (if not also directed catch) is occurring, and habitat conditions are deteriorating. Populations in Gabon and northern Congo appear healthy, but recently documented bycatches and utilisation in Congo may be indicative of a growing reliance on non-fish marine wildlife, including dolphins, as food.

In view of the growing concern (e.g. summarised in SC/62/SM6) that the Atlantic humpback dolphin faces some of the same threats that led to the extinction of the baiji and caused the vaquita to become critically endangered, the Committee **recommends** that IUCN reassess the Atlantic humpback dolphin's status in the light of new information.

It also **recommends** the following items for further conservation and research action for Atlantic humpback dolphins, taking into account *inter alia* the CMS regional action plan for the conservation of West African small cetaceans[4].

(1) Coordinated data collection should be facilitated in order to improve knowledge of the abundance, distribution and conservation status of *S. teuszii* throughout its known range. Specifically:
  - (a) estimates of abundance and distribution are urgently required (including where feasible photo-id);
  - (b) tissue samples should be obtained at every opportunity from stranded or bycaught Atlantic humpback dolphins. These need to be appropriately preserved and provided to scientists for genetic analyses investigating population structure;
  - (c) critical habitats should be identified, including areas of high density and regular occurrence ('hotspots') and migratory pathways (if such exist), as candidates for focused conservation effort; and
  - (d) overviews of existing knowledge, national species lists, specimen collections, research centres and protected areas should be compiled.

(2) Identify and mitigate known and potential threats to *S. teuszii*, particularly entanglement in fishing gear, and directed take and anthropogenic noise. Specifically this should include:

[4]Action Plan for the Conservation of Small Cetaceans of Western Africa and Macronesia, ratified in 2008 by West African member nations of CMS.

(a) improving the understanding of the causes, levels and impacts of bycatch on *S. teuszii*;
(b) assessment of the causes, level and intensity of directed small cetacean takes;
(c) efforts should be made to minimise the ecological impacts of fisheries on, and direct takes of, *S. teuszii* through the implementation of explicit fisheries management measures; and
(d) ensure that all littoral developments and activities take into account their potential for having negative effects on small cetaceans and the environment.

(3) The designation and management of national and transboundary marine protected areas that include *S. teuszii* habitat based on scientific data and broad stakeholder involvement should be encouraged.

The Committee also specifically **recommends** that regional or sub-regional research projects be conducted that would allow the preparation of management plans for the conservation of Atlantic humpback dolphins in particular areas. Candidate areas are: (a) off Flamingos, Angola; (b) along the coasts of Gabon-Congo; (c) Senegal-The Gambia-Guinea-Bissau-Guinea-Sierra Leone where the humpback dolphin population(s) may be transboundary and where bycatch is a serious concern; and (d) Mauritania where humpback dolphins were observed regularly in Banc d'Arguin National Park and environs over many years, but may have declined recently (Van Waerebeek and Perrin, 2007).

The Committee **strongly encourages** scientists in the range states to submit collaborative proposals for funding so that transboundary problems can be addressed in a comprehensive way, possibly cooperating with the staff of National Parks.

General recommendations relevant to all species

In general, the Committee **acknowledges** that the failure to manage industrial fisheries sustainably has often caused coastal artisanal and subsistence fisheries to suffer and, in turn, has led local people to seek alternative resources for consumption, including cetaceans.

Given the observed threats and the existing knowledge, the Committee makes the following general **recommendations** applicable to all small cetacean species in the west and northwestern Africa.

(1) The tallying of cetacean landings should be implemented as a standard procedure for fisheries observers at the national level, including the collection of photographic material, recognizing that small cetaceans are a *de facto* exploited marine living resource and therefore need to be monitored on a permanent basis.
(2) An intensive biological sampling programme based on fresh carcasses, collecting data on morphological variation, reproduction, growth, feeding, stock identification, genetics, migratory habits, etc. of cetacean species should be implemented.
(3) Use of platforms of opportunity should be intensified to collect data on distribution, relative abundance and behaviour of cetaceans.
(4) Further assessment of the links between declining fish catches and increasing takes of small cetaceans in West Africa should be made.

In at least three west African countries, Ghana, Togo and Guinea, the ongoing activities represented good examples of how the first two of these recommendations could be realised. The Committee **acknowledges** the contributions already being made by scientists in Nigeria and Benin and recognised that there is a great need for capacity building and financial support before such programmes can be implemented. The same is true for São Tomé and Príncipe where the status of small cetacean populations has not been fully assessed and for the Cape Verde Islands, where no study of small cetaceans has ever been conducted. With regard to the third recommendation, the Committee noted and commended the published work by Weir (2007; 2010) and de Boer (2010), much of which was based on data from platforms of opportunity (e.g. seismic survey vessels, oceanographic research vessels); these are seen as excellent examples of how this recommendation can be realised in more areas.

In conclusion, the Committee **recommends** international collaboration for funding and capacity building to support programmes for monitoring, management and conservation of coastal marine living resources in this region.

14.2 Review report from the working group on climate change and small cetaceans

The Committee received a summary on the ongoing plans for an IWC workshop on the effects of climate change on small cetaceans. The workshop plan (10-12 invited participants meeting for 3 days) was agreed last year but the workshop was not held in the last intersessional period as the final *tranche* of funding was only confirmed late in the year. The steering group and convener (Simmonds) are now finalising plans for the workshop, which will probably be held in Vienna in November 2010 (see Appendix 2 of Annex L). The focal topics are: (a) restricted habitats; (b) range changes; and (c) the Arctic region. During discussion it was suggested that pathogens should also be discussed.

The Committee **re-confirms** its support for the meeting and looks forward to receiving a full report of this workshop at the next annual meeting in 2011.

14.3 Review progress on previous recommendations

IWC Resolution 2001-13 (IWC, 2002b) directs the Scientific Committee to review progress on previous recommendations related to critically endangered species and stocks of cetaceans on a regular basis and the Committee noted that its previous recommendations stand until new information is received and considered.

14.3.1 Vaquita

The Committee reviewed new information on the critically endangered vaquita. SC/62/SM3 reported on a survey in the Upper Gulf of California that was conducted from mid-September, through October and November 2008 in a joint effort between the governments of Mexico and the US. The primary objective was to test alternative acoustic detection technology as a means of monitoring trends in vaquita abundance. Total abundance (based on both acoustic and visual data) was estimated as 250 animals (95% CI 110, 564). The estimate for waters inside the Vaquita Refuge was 123 (95% CI=64-239). The total estimate for 1997 had been 567 (95% CI=177-1,073). Analyses strongly support a population decline over the 11 years from 1997 to 2008. The overall distribution did not change between the two surveys, indicating that the apparent decline was not an artifact of a distributional shift. Approximately half of the population appears to be present inside the Vaquita Refuge area at any time, with individuals moving freely into and out of the refuge. Hence, they are at risk of interaction with fishing operations when outside of the refuge, and this means that protection from bycatch is only partial. Fishermen consider waters inside the Refuge to be a prime shrimping area and thus fishing activity is very intensive immediately outside its borders. The buyout programme begun by the Mexican government in 2007 has reduced the fishing effort by about 40%, but over 600 artisanal boats (*pangas*) are still fishing and those fishermen who remain active are strongly committed and unlikely to accept the buy-out offers from the government. This makes it crucial to develop alternative fishing methods that do not involve the risk of vaquita bycatch.

The Mexican government made a commitment to reduce the vaquita bycatch to zero within three years starting in 2008. There are no data to confirm that the bycatch rate has been reduced apart from an inference from the reduction in fishing effort; because of the regulatory situation, fishermen generally no longer report and deliver bycaught vaquitas to authorities. This makes the implementation of regulations particularly challenging.

SC/62/SM5 reported on the development of a monitoring plan to assess trends in vaquita abundance based on acoustics using C-POD. It is anticipated that the scheme will be in operation by the end of this year (2010). Jaramillo-Legorreta acknowledged the financial support provided to this work by a number of agencies and organisations in addition to the Mexican government: National Marine Fisheries Service, WWF, the Cousteau Society, Ocean Foundation, US Marine Mammal Commission and International Fund for Animal Welfare.

The Committee thanks Jaramillo-Legorreta for this update and commends those involved for their hard work and commitment to saving the vaquita. The Committee **agrees** that it would be useful to document (in working papers or publications) all of the costs of the vaquita conservation and monitoring efforts for future reference for other Countries with similar bycatch problems.

The Committee **remains gravely concerned** about the fate of the vaquita and it **reiterates its previous recommendation** (IWC, 2010h, p.324) that, if extinction is to be avoided, all gillnets should be removed from the upper part of the Gulf of California. The Committee further **recommends** intensified development and testing of alternative fishing gear (e.g. through a smart-gear competition) that fishermen can use in place of entangle gears. It **strongly encourages** Mexico to continue and intensify its efforts to conserve the vaquita.

14.3.2 Harbour porpoise

No primary papers on harbour porpoises were presented at this meeting.

A joint workshop of ASCOBANS/ECS recommended a revision of EU regulation 812/2004 on monitoring and mitigation of cetacean bycatch in gillnet and pelagic trawl fisheries, as at present it does not include small vessels of less than 15m length. The Committee **recommends** that the EU regulation should be reviewed if realistic total estimates of bycatch are to be provided.

Available information for the German North Sea and Baltic from 2003 to 2009 suggests an increasing trend in bycatch. As last year, the Committee **expresses concern** about the ongoing evidence of large-scale bycatch in this region, including the western Baltic (as discussed last year when the Committee called for more research). The Committee **notes**, in particular, that the harbour porpoise population in the Baltic proper is considered Critically Endangered. Better information on both the scale of incidental mortality and the stock affinities of the affected porpoises is essential.

Attention was drawn to the vulnerability of the recently identified a isolated Iberian population of harbour porpoises. The Committee **recommends** further study of this population.

14.3.3 Franciscana

The franciscana, endemic to the eastern coasts of Brazil, Uruguay and Argentina, is regarded as one of the most threatened small cetaceans in South America due to high bycatch levels as well as increasing habitat degradation throughout its range. It is classified as Vulnerable by IUCN. Secchi *et al.* (2003) proposed four management stocks (known as Franciscana Management Areas or FMAs): three in Brazil (FMA I-III), one in Uruguay (FMA III) and one in Argentina (FMA IV).

Mendez *et al.* (2010) stressed that considering all franciscana genetic analyses to date, there is strong evidence for the existence of at least three populations in Brazil (FMAs I, II and III), one in Uruguay (FMA III) and three in Argentina (FMA IV).

The Committee welcomes the new information concerning franciscana stocks in Argentina and encourages the continuation of research and conservation efforts on the species there, particularly in light of the high bycatch rates. It **recommends** that the possibility of further population structure within the range of the franciscana be investigated.

SC/62/SM7 presented information on distribution and provided the first estimate of abundance of franciscanas in FMA II (Brazil) from aerial surveys conducted in December 2008 and January 2009. Coverage included an area believed to correspond to a hiatus in the distribution between FMA I and FMA II. Sightings were confined to the coastal stratum, but offshore effort was low due to poor weather conditions. Corrected abundance was estimated to range between 8,000 and 9,000 individuals (CVs=0.32-0.35) although some additional sources of possible bias require investigation. Current estimates of incidental mortality in FMA II correspond to 3.3-6.2% of the estimated population size presented here, which is likely unsustainable.

The Committee **welcomes** this paper that addresses recommendations from previous years (IWC, 2005g, p.309). It notes that the estimates of abundance were probably negatively biased because of limited coverage of the offshore stratum and because estimates of group size from aircraft are consistently smaller than those from boats and land observation sites.

With regard to the aerial surveys in FMA II, the sub-committee commends Zerbini and his co-workers for their excellent work and **recommends** that further studies be carried out to:

(1) improve estimates of visibility bias;
(2) evaluate potential biases in the estimation of group sizes; and
(3) estimate franciscana diving parameters in areas where such information is not available.

The Committee also **recommends** that bycatch be estimated in additional areas and assessments be carried out of other possible threat factors such as underwater noise, chemical pollution from coastal development and industrial and human waste discharge, oil and gas exploration activities and vessel traffic.

14.3.4 Narwhal

Last year (IWC, 2010h, p.325), the Committee noted that new estimates of narwhal abundance had recently become available. Subsequently, the results of aerial surveys in Canada indicating total abundance greater than 60,000 narwhals were published (Richard *et al.*, 2010). The NAMMCO Scientific Committee considered new estimates from Greenland in its management advice given in April 2009 (IWC/62/4). At its 2009 meeting, the NAMMCO Council (NAMMCO Annual Report 2009, pp.96-97) considered the new information on narwhal abundance and revised its management advice accordingly. The 2005 NAMMCO assessment had concluded that narwhals in West Greenland were highly depleted and that annual sustainable harvest levels would be as low as 15-75 animals. However, population modelling with the new survey data from 2007 and 2008 indicated that overall abundance was at 51% (95% CI: 27-79%) of carrying capacity, with a 2009 modelled abundance of 12,000 (95% CI: 6,200-26,000), and NAMMCO concluded that its management objectives would be met at 70% probability with annual total removals of 310 (West Greenland) and 85 (East Greenland).

The Committee **thanks** the NAMMCO observer for providing information and **encourages** closer links between the NAMMCO and IWC Secretariats in sharing information, e.g. catch data. The possibility of a joint special meeting or workshop on monodontids (involving IWC, NAMMCO, Canada-Greenland Joint Commission on Narwhal and Beluga) should be considered in the near future, assuming that a data availability agreement can be established in advance. The next meeting of the Joint NAMMCO SC and JCNB scientific working group on narwhal and beluga will probably be in 2012, leaving adequate time to explore the potential of a joint meeting/workshop. The Committee **agrees** that an e-mail working group convened by Bjørge will follow up this possibility during the intersessional period and report back next year.

14.3.5 Irrawaddy dolphin

The freshwater population of Irrawaddy dolphins in the Mekong River is Critically Endangered (Smith and Beasley, 2004).

SC/62/WW4 reported on dolphin-watching tourism in the Mekong where photo-id studies indicate dolphins exhibit high site fidelity to particular deep-water pool areas that are very limited in size (1-2 km^2). The authors argued that an adaptive, precautionary approach is essential to managing tourism that targets small, closed, resident communities of cetaceans such as in this case. SC/62/WW4 recommended a range of management interventions, all aimed at decreasing the exposure of dolphins to dolphin-watching vessels.

The Committee received information from World Wide Fund for Nature (WWF)-Cambodia indicating that there are fewer than 100 dolphins based on a photographic mark-recapture analysis. At least 92 dolphins (>63% of them classified as calves) died in the period 2003-09, likely due primarily to entanglement in fishing gear and conservation efforts have focussed on the elimination of gill nets in the core habitat for dolphins in the 200km stretch of the Mekong between Kratie town and the Lao border. The conservation of dolphins in the Mekong is primarily the responsibility of the Commission on Dolphin Conservation and Ecotourism Development (Dolphin Commission). Despite its efforts, the mortality rate has remained high and the population apparently is continuing to decline. Dolphin conservation efforts in Cambodia reportedly have been hindered by inadequate funding for the Dolphin Commission and the lack of regulations that could help to reduce or eliminate the use of gill nets. There is also a need for much better cooperation among the Dolphin Commission, the Fisheries Administration and WWF. WWF and the Fisheries Administration are currently working to develop protected areas and other regulatory tools to protect dolphins. WWF and local NGOs are also working with local communities to reduce gill net use and to develop alternative livelihoods in order to reduce fishing pressure in core dolphin habitat.

The Committee **expresses grave concern** about the rapid and not fully explained decline of this riverine population. It commends the efforts by Cambodian government agencies and WWF-Cambodia to diagnose the cause(s) of the decline, and **strongly recommends** that every effort be made to stop and reverse it, e.g. by immediately eliminating entangling fishing gear in the pool areas used most intensively by the dolphins and by taking immediate steps to reduce the exposure of the dolphins to tour boat traffic.

14.3.6 Other

The Committee received an update (SC/62/SM2) of Amaral *et al.* (2009), the goal of which is to revise the model of worldwide population structure of common dolphins, genus *Delphinus,* using a multilocus approach. It has become clear that the long-beaked population in the northeastern Pacific is highly differentiated from all other populations based on both nuclear and mitochondrial markers. The differentiation between short-beaked populations occurring in different oceans is even higher than suggested in Amaral *et al.* (2009). Future analyses will estimate divergence times and migration rates between the different populations. This study also highlighted the difficulty of obtaining informative molecular markers other than mitochondrial DNA and microsatellites, due to the low overall level of polymorphism in the nuclear genome of common dolphins.

The Committee **encourages** the continuation of this global study of the genus. It also **recommends** that efforts should be made to obtain samples from regions where both short-beaked and long-beaked forms occur, as is the case in West Africa and the southeastern Pacific.

14.4 Other information presented

SC/62/BC6 presents a preliminary global review of operational interactions between odontocetes and the longline fishing industry and potential approaches to mitigation. This is a global problem for both cetaceans and fishermen. Mitigation strategies are needed to ensure the sustainability of both the odontocete populations and the longline fisheries. Bycatch occurs in many longline fisheries and involves at least 13 species but there are few quantitative data. The inadequacy of life history and population data adds to the difficulty of assessing the sustainability of the bycatch in most cases. Considerable effort has been devoted to solving the depredation problem and potential solutions have included acoustic and physical tools. Acoustic approaches to mitigation have proven problematic but recent trials using physical depredation mitigation devices have yielded promising results.

In discussion it was noted that longline fisheries for halibut and Greenland halibut in the northern North Atlantic have increasingly experienced problems with depredation of catches by northern bottlenose whales (*Hyperoodon ampullatus*).

New information was presented on the ongoing commitment of the Italian government (Ministry of the Environment) to conduct systematic abundance aerial surveys of small cetaceans in Italian waters (Ligurian, Tyrrhenian, Sardinian and Ionian seas) and in the Pelagos Sanctuary. Initial scientific and technical support was provided by the IWC Head of Science. The surverys are a priority action common to the Sanctuary Management Plan, ACCOBAMS and RAC/SPA UNEP. Among the preliminary conclusions from the completed surveys were: (1) the Sanctuary does not cover the full population range of striped dolphins; and (2) there is substantial seasonal variation in the density and abundance of striped dolphins (higher in summer). These density and distribution data from the surveys will be instrumental to the proposed ACCOBAMS basin-wide survey and will help guide the development of a long-term monitoring programme. The Committee also **welcomes** news of a complete survey of the Adriatic Sea funded by the Italian Government in July-August 2010.

The ACCOBAMS observer reported that a basin-wide survey of cetaceans in the Mediterranean and Black Seas remains one of ACCOBAMS' highest priorities. Activities are underway with the aim to start such a survey in the next triennium (2011-13).

The Committee **welcomes** the new information and **supports** continuation of such efforts in the Mediterranean Sea and adjacent areas. It specifically **endorses**, as it has in the past, implementation of the ACCOBAMS basin-wide survey, as soon as possible.

14.5 Review of takes of small cetaceans

At the last meeting, the sub-committee discussed various problems associated with the compilation of data on takes of small cetaceans including both direct catches and bycatch (IWC, 2010h, pp.326-28). It recommended a series of changes in how the data should be compiled, reported and interpreted. The process of setting up a system for direct electronic submission of these data by national representatives is still ongoing. The information retrieved by the Secretariat from national progress reports was reviewed. Data on bycatch of small cetaceans was presented in 12 National Progress Reports (Annex L, table 2).

The Committee **reiterates** the importance of having these data submitted and **encourages** all countries to do so.

The observer from NAMMCO advised that catch data from member countries are routinely published in the NAMMCO Annual Reports that are available on the website *http://www.nammco.no*.

Concern was expressed about the information from 12 West African countries indicating human consumption of cetaceans, exchange of cetacean meat in markets or direct capture of cetaceans (see Annex L, table 1); consumption and exchange can lead to targeted and unregulated direct hunting.

Information was received on small cetacean interactions with fishing gear in Machalilla National Park, Ecuador. Four species of cetaceans were caught incidentally: common bottlenose dolphins, dwarf sperm whales, Risso's dolphins and pantropical spotted dolphins. The Committee **expresses concern** about the implications of the bycatch documented in this preliminary study and looks forward to a more detailed report next year on the scale of the fisheries involved and therefore the implied magnitude of the cetacean bycatch.

14.6 Voluntary Fund for Small Cetaceans Conservation Research

The Committee discussed a proposed mechanism and procedure for allocating project support for high priority conservation projects (e.g. improving status of threatened species, capacity building) from the IWC Small Cetacean Research Fund. Australia's recent contribution to the fund is intended to support high priority research that demonstrably links to improving conservation outcomes for small cetaceans globally, particularly those that are threatened or especially vulnerable to human activities. Preference for funding will be based on a determination of need, the quality of the research application and the demonstration of links between research and conservation outcomes. Proposals that demonstrate a capacity building legacy will be viewed favourably.

In order to maximise the number of projects supported by the fund, and hence enhance conservation outcomes for small cetaceans, any single proposal will be limited to a maximum of £34,000. Other IWC member governments will also be encouraged to provide additional voluntary donations to the fund to further support small cetacean research.

A funding application form is being developed and made available via the IWC Secretariat. Applications should be received by the Secretariat at least 60 days prior to the start of the Committee's Annual Meeting. A Review Group will be appointed by the Convenor of the Small Cetacean sub-committee to review proposals in accord with agreed criteria. The group will make recommendations for funding to the Small Cetaceans sub-committee. It may suggest improvements to proposals where appropriate and can solicit the assistance of other researchers in the review process if necessary.

The recommended projects and budgets will be reviewed by the Small Cetacean sub-committee and the full Scientific Committee. Recommended proposals will be added to the Committee's budget as a specific request to the Voluntary Research Fund for Small Cetaceans. The Secretariat will organise contracts for the projects that are approved for funding by the Commission.

The Committee **emphasises** the importance of ensuring that proposal review and project selection meet the criteria and priorities of the sub-committee on small cetaceans. In addition to a call for proposals via a circular from the IWC Secretariat to all members of the Scientific Committee, a broader announcement mechanism will be developed.

The Committee **expressed** its gratitude to the Government of Australia for its generous contribution to the Voluntary Fund for Small Cetacean Conservation Research, which will make a significant difference to the Fund's ability to pursue its conservation priorities.

The Committee also **emphasises** the importance of building the Fund by obtaining donations from other sources. It was noted that good outcomes from the funded research should encourage more countries to contribute.

14.6.1 Project Proposal for the Voluntary Fund for Small Cetacean Conservation Research

A proposal for funding by the Small Cetacean Conservation Research Fund entitled '*Threatened Franciscanas: Improving Estimates of Abundance to Guide Conservation Actions*' was presented (Annex L, Appendix 3). The proposed work is directly linked to previous recommendations of the sub-committee, and responds directly to recommendations made at the present meeting based on consideration of SC/62/SM7 (see Annex L).

The sub-committee **strongly supports** the proposal, based on the following considerations:

(1) the franciscana is threatened by a variety of human activities in the region, particularly artisanal fishing;
(2) the proposal addresses a clear conservation need as expressed in present and previous recommendations; and

(3) more robust estimates of franciscana abundance (along with improved, more nearly complete estimates of bycatch as well as assessments of other threat factors) are needed to assess the status of populations and develop appropriate mitigation efforts.

The proponents have a strong track record (e.g. as reflected in the quality of the work described in SC/62/SM7).

The Committee therefore **recommends** that the proposal be funded by the Voluntary Fund for Small Cetacean Conservation Research and that a full report on the results be provided for consideration at a future meeting.

14.7 Work plan

The sub-committee on small cetaceans reviewed its schedule of priority topics which currently includes:

(1) systematics and population structure of *Tursiops*;
(2) status of ziphiids worldwide; and
(3) fishery depredation by small cetaceans.

The Committee **agrees** that the priority topic for the next annual meeting will be the status of ziphiids (beaked and bottlenose whales) worldwide.

Further discussion of potential future topics can be found in Annex L. As part of the discussion it was agreed to establish an intersessional correspondence group convened by Ritter to consider whether the issue of the consumption of cetaceans ('marine bushmeat') as some type of substitute for other resources that are becoming scarce should be added to the priority topic list. The group will collate information intersessionally and report back at the next annual meeting.

The Committee will also review the report from the Workshop on climate change and small cetaceans.

15. WHALEWATCHING (WW)

The report of the sub-committee on whalewatching is given as Annex M. Scientific aspects of whalewatching have been discussed formally within the Committee since a Commission Resolution in 1994 (IWC, 1995b).

15.1 Proposal for a large-scale whalewatching experiment (LaWE; including reports from the intersessional steering group and the advisory group)

The Committee received a proposal from the large-scale whalewatching experiment (LaWE) intersessional steering group. The report elaborated on the objectives, aims, methodology, design, management and funding considerations for this initiative (Annex M, Appendix 2).

Three options were presented for procedural mechanisms to manage the different components of the LaWE project, ranging from top-down (in which the IWC would play a steering group role) to decentralised (in which the IWC would play a coordinating role (Annex M, item 5.1, fig. 1). After discussion, the Committee **agrees** that a transitional process is preferable, with a top down approach (hierarchical structure) at the initial stage of the project progressing into a mechanism where the IWC would play more of a coordinating role (network structure). Discussions are detailed in Annex M, item 5.1.

IWC member nations will be able to use the results of the project as the basis for appropriate scientific management of whalewatching. The information collected during LaWE will also provide data on general biology and life history parameters of cetaceans that are relevant to other aspects of the Committee's work. There are a variety of potential funding sources for the LaWE effort including:

(1) IWC membership: funding derived from fees/contributions from member nations;
(2) national/regional initiatives: funding derived from national or regional governments involved in the support/promotion of whalewatching;
(3) NGOs: funding derived from national/international NGOs involved in the conservation of cetaceans;
(4) whalewatching operators: funding derived from whale/dolphin-watching operators; and
(5) hybrid model: targets key operators in high profile whalewatching areas with additional funding sought from host countries, IWC, NGOs, and other sources.

The Committee **recommends** that an e-mail correspondence group be formed to further develop the budget for the LaWE, although it noted that until power analyses are completed and species and sites are chosen, only approximate budgets can be created.

The Committee **agrees** to combine the two previous LaWE intersessional groups into one 'steering group' to maximise collaborative discussions (see Annex M, item 5.1).

The budget request to assist the LaWE intersessional work to develop procedural mechanisms to centralise data received from research groups relevant to LaWE with the Secretariat and commence power analysis for key parameters depending on data received is discussed under Item 24. In addition, funding is requested for a pre-meeting of the LaWE steering committee to review and advance intersessional progress on all aspects of the project, including reviewing data received, advancements in power analysis, and the selection of appropriate study species and sites.

There was no formal report from the advisory group, as the LaWE is not yet at the point of selecting research sites.

15.1.1 Other

SC/62/WW5 presented a summary of progress from a working group tasked with developing a formal mathematical structure from the US National Academy of Sciences Population Consequences of Acoustic Disturbance (PCAD) conceptual framework. The working group decided to develop three statistical models to provide the linkages from disturbance to population dynamics. Work has focused on the first models (disturbance to physiological conditions). First implementations with simple systems (southern elephant seals at-sea movement) proved extremely successful and body condition time series could be estimated and validated against body weight when the seals returned to the colony. A similar, albeit more complex, model was developed for coastal dolphin population case studies and will be implemented over the next year.

Discussions on the motivational state-space approach to the PCAD model and concern about the restrictions on the remit of the PCAD project are detailed in Annex M, item 5.1.

15.2 Review of whalewatching off North Africa

SC/62/SM8 reported on cetacean sightings, local human activities and conservation off São Tomé (São Tomé and Príncipe), Gulf of Guinea, West Africa. This region seems to be an important area for cetaceans; however, the status of species or populations has not been assessed due, in part, to lack of information and effort. A similar situation may exist in the Cape Verde Islands where there are resorts and a significant number of tourists. It was noted that several measures regarding the conservation of natural populations of cetaceans are needed for these areas (including international standards of operation, educational programmes and research) to reinforce a change to a more conservation-oriented perspective with direct involvement of local communities.

The Committee welcomed the report and noted the lack of information on whalewatching activities in western and northern Africa. Furthermore, it **expresses concern** at the potential for expansion of whalewatching activities in the region without sufficient scientific information on cetaceans and called for an assessment of the scope of activities to be made by relevant authorities as soon as possible.

An overview of whalewatching activities in the Mediterranean will be prepared under ACCOBAMS. More information is available on the Agreement's official website, *http://www.accobams.org*.

15.3 Assess the impact of whalewatching on cetaceans

SC/62/WW4 reported on the critically endangered Irrawaddy dolphin population inhabiting the Mekong River. Studies indicate dolphins exhibit high site fidelity during the dry season, have low genetic diversity and a high mortality rate. The locations of dolphin-watching areas are at two of the critical habitats for the remaining population in the river, numbering less than 100 individuals. Initially, at both locations, the dolphin-watching industry was land-based, with a few row-boats occasionally taking tourists into the pool to view dolphins. By the early 2000s this expanded to approximately 15 larger motorised boats that offered dolphin tours. Now it numbers more than 20. The authors believe that an adaptive, precautionary approach is essential to managing tourism that targets small, closed, resident communities of cetaceans and that for this Critically Endangered population, a 'no vessel-based dolphin tourism' policy is desirable. It was noted that the issues associated with Cambodian cetacean-watching tourism may be generic to developing countries.

The Committee reiterated **its concern** over the critically endangered Mekong River Irrawaddy dolphin population. In 2006, it had noted that there was compelling evidence that the fitness of individual odontocetes repeatedly exposed to tour vessel traffic can be compromised and that this can lead to population level effects (IWC, 2007b). It also stated that, in the absence of data, it should be assumed that such effects are possible until indicated otherwise – particularly for small, isolated and resident populations. Accordingly, the Committee **strongly recommends** that the Cambodian government and relevant agencies make every effort to reduce the exposure of dolphins to vessel-based tourism in deep-water pools in the Mekong River.

SC/62/WW1 reported on behavioural responses of southern right whales to human approaches in Bahia San Antonio, Rio Negro, Argentina. Results are listed in Annex M, item 6. The Committee noted the small sample size but commended the before-during-after experimental design.

SC/62/WW2 summarised recent advances in whale-watching research. Noren *et al.* (2009) investigated the prevalence of 'surface active behaviours' (e.g. spy hops, breaches) in the vicinity of boats in southern resident killer whales; Arcangeli and Crosti (2009) conducted a study on an Australian common bottlenose dolphin (*Tursiops truncatus*) population in the coastal waters of Bunbury; Christiansen *et al.* (2010) used a Markov chain analysis to investigate changes in Zanzibar Indo-Pacific bottlenose dolphin (*T. aduncus*) behavioural states in relation to boat traffic; Scarpaci *et al.* (In press) reported on the impact of swim-with-cetacean tourism on bottlenose dolphins within a 'sanctuary zone' in Port Phillip Bay, Australia; Sousa-Lima and Clark (2009) used automated acoustic recordings to monitor and track the singing behaviour of male humpback whales in Abrolhos Marine National Park, Brazil, a major humpback whale breeding ground; Stamation *et al.* (2010) monitored the behaviour of groups of humpback whales off Queensland Australia from both whalewatching vessels and land-based platforms; Filla and Monteiro (2009) investigated various types of whalewatching on estuarine or 'guianensis' dolphins (*Sotalia guianensis*) in Cananéia, southeast Brazil; and Jensen *et al.* (2009) found that common bottlenose dolphin and pilot whale (*Globicephala macrorhynchus*) communication calls could be masked substantially by small outboard engine noise. Summaries are presented in Annex M, item 7.

The Committee **welcomes** this review and encouraged the author to prepare a similar review for the next meeting. It was clarified that these reviews are not critiques of methods or results but rather a compilation of new research results of interest.

SC/62/WW3 reported on the US National Oceanic and Atmospheric Administration's efforts to develop management plans to reduce the exposure of resting spinner dolphins (*Stenella longirostris*) to human activity in Hawaiian waters. One management approach under consideration focuses on time-area closures to reduce the number and intensity of interactions between humans and dolphins during critical rest periods in particular bays. Research will combine boat-based and land-based visual observations with passive acoustic monitoring and is an international collaboration between researchers from American, Australian and Scottish universities. Time area closures will not be implemented until a full year of pre-closure data collection has been completed. The authors highlighted this study as a possible candidate project for inclusion in the Large-scale Whalewatching Experiment (LaWE) initiative, as it incorporates many facets that the LaWE initiative strives to achieve.

The Committee **commends** this study and deems it relevant to the LaWE initiative.

SC/62/WW8 presented a precaution on interpreting the results of impact study data analysis. The paper discussed the possibility of confounding variables when interpreting correlations between whalewatching exposure and reproductive parameters of female humpback whales (see Weinrich and Corbelli, 2009). Discussion is presented in Annex M, item 7.

The Committee **welcomes** this paper as an important consideration in impact analyses. It was noted that this contribution clarifies that whalewatching is essentially another habitat variable, and should be treated as such in multivariate models.

Parrot *et al.* (2010) report on an agent-based simulation platform to assess the characteristics of interactions between whales and vessels under different scenarios. The simulation is composed of a spatial environment in which a whale individual-based model and a boat agent-based model can evolve. It simulates the spatiotemporal movement of marine mammals and vessel traffic in the St Lawrence Estuary. It estimates movement parameters from long-term data collected using both onboard GPS and vessel monitoring systems for vessels and a variety of land-based and boat-based focal follows as well as sightings for marine mammals from whalewatching boats.

This platform can be used to inform decision-making by simulating different vessel and whalewatching traffic scenarios.

This project is highly relevant to the LaWE objectives and offers an avenue to simulate boat interaction consequences for cetaceans using behavioural statistical models of disturbance effects. The Committee **welcomes** this effort.

The Committee noted that its work on whalewatching has been influential with other research initiatives to understand effects of disturbances on cetacean populations.

At last year's meeting, there was discussion on the impacts of aerial whalewatching (IWC, 2010i). Groch noted that she was not able to analyse behavioural data collected in previous years during southern right whale photo-id surveys from a helicopter in Brazil. Sironi reported that a trial was conducted to record before-during-after behavioural observations during the 2009 southern right whale photo-id aerial survey in Argentina from a fixed-winged aircraft. Dedicated flights are required to obtain more accurate behavioural data.

15.4 Review reports of intersessional working groups

15.4.1 Online database for worldwide tracking of commercial whalewatching/associated data collection

Robbins summarised the status of an online database for tracking whalewatching operations and associated data collection programmes. This database was originally described in Robbins and Frost (2009) and is intended to facilitate studies of whalewatching impact as well as to allow better assessments of the scientific value of data collection programmes. Database development has made considerable progress intersessionally and should be available to go online prior to next year's meeting. The Committee **recommends** that the intersessional working group continue and report back next year (see Annex Q).

15.4.2 Swim-with-whale operations

Rose reported that due to time constraints, no progress was made intersessionally on field-testing a questionnaire to further assess the extent of swim-with-whale operations. However, a draft questionnaire is ready to be distributed and plans are in place to do so in the Dominican Republic and possibly Australia before next year's meeting. The Committee welcomes the commitment of funding for this effort by the Pacific Whale Foundation and **recommends** that the intersessional working group continue and report back next year (see Annex Q).

15.5 Other issues

15.5.1 Consider information from platforms of opportunity of potential value to the Scientific Committee

Progress continues in efforts to stimulate submission of opportunistic data from ecotourism cruise ships in the Southern Ocean to the Antarctic Humpback Whale Catalogue (AHWC). The availability of these data has broadened understanding of the exchange between areas and in some cases provided information that was previously not available. Ritter (2010) reported on a near-miss event involving a large vessel and humpback whales off Antarctica (see Annex M, item 9.1).

Smit *et al.* (2010) reported on opportunistic research off the coast of La Gomera, Canary Islands (Annex M, item 9.1). The study highlights the importance and the potential of mutual long-term co-operation between whalewatching operators and scientists. The Committee welcomes the reports and reiterated the value of collaboration between researchers and whalewatching operations and other platforms of opportunity.

15.5.2 Review of whalewatching guidelines and regulations

The compendium of whalewatching guidelines and regulations around the world is in the process of being updated and will be available on the IWC's website in August. SC/62/WW2 described several papers relating to guidelines and compliance including Noren *et al.* (2009), Williams *et al.* (2009a); Stamation *et al.* (2010); Sousa-Lima and Clark (2009); and Jensen *et al.* (2009).

Summaries of the reports are found in Annex M, item 9.2.

15.5.3 Review of risk to cetaceans from collisions with whalewatching vessels

No new information was brought to the meeting this year. Some members indicated that papers on this item would be submitted to next year's meeting. The Committee noted that this issue will be discussed at a joint workshop with ACCOBAMS in Monaco from 21-24 September 2010.

15.5.4 Future of the sub-committee on whalewatching

The Committee took note of IWC/62/CC8 and the possible interface between the Conservation Committee's work and its own work on whalewatching. The Conservation Committee has established a Standing Working Group on Whalewatching and intends to develop a draft strategic plan for five years (2010-15). IWC/62/CC8 made reference to the work of the Committee and various scientific issues and the section on Capacity Building and Development states that actions 'may include… provision of expert assistance through the Scientific Committee's sub-committee on whalewatching'.

The Committee requests clarification on the mechanism by which this expert assistance will inform the work of the Standing Working Group. It welcomes the opportunity to liaise with the Conservation Committee and Commission, but noted its own terms of reference, and believes that the advice it offers should be within that framework. One possible mechanism, for example, would be to designate a representative from the Committee to work directly with the CC on this issue, thereby providing a formal interface.

The Committee is also seeking clarification on the envisioned management objectives for whalewatching, as IWC/62/CC8 states both 'growth' and 'sustainability' objectives. Clarification will guide the scientific work of the Committee for Objective 7 of the LaWE project ('Develop an integrated and adaptive management framework for whalewatching that accounts for uncertainties, and includes monitoring and feedback mechanisms').

The Committee draws the attention of the Conservation Committee to the definitions of whale ecotourism developed at previous meetings (IWC, 2006c) and considered it important that the Conservation Committee takes a strategic view of what it might achieve in the five years. It also **stresses** the importance of a good scientific basis for the work that it is recommending to the Commission.

It was noted that it would be valuable to increase communication with and explore possibilities for collaborate with the UN World Tourism Organisation, as its remit complements the work of the sub-committee in a number of aspects. Lusseau agreed to liaise for this purpose.

15.5.5 Other

Eisfield *et al.* (2010) reported on the behaviour of a female solitary sociable dolphin studied on the southeast coast of England in 2007, previously addressed by the Committee. The report is summarised in Annex M, item 9.5.

The Committee **reiterates its recommendation** of 2008: habituation of solitary dolphins can make them vulnerable to harm, including being killed, and should be avoided.

16. DNA TESTING (DNA)

The report of the Working Group on DNA is given as Annex N. This particular Agenda Item has been considered since 2000 (IWC, 2001d; 2001e; 2001h) in response to a Commission Resolution (IWC, 2000).

16.1 Review genetic methods for species, stock and individual identification

No new documents were submitted under this Item this year. Last year, the Committee had reviewed Cipriano and Pastene (2009), which provided a comprehensive review of current knowledge of techniques to extract DNA from 'difficult' samples.

16.2 Review results of the amendments of sequences deposited in GenBank

During the first round of sequence assessment (IWC, 2009i, p.347), some inconsistencies were found for some sequences assigned to right and minke whales. These appeared to have been due to a lag in the taxonomy recognised by *GenBank* or uncertainty in taxonomic distinctions currently under investigation (e.g. the number of species and appropriate names for recently described species of 'Bryde's whales').

Last year, the Committee noted that the original submitter would be notified of the inconsistencies and a suggestion made that an amendment be made to the entry. Pastene reported that he had contacted *GenBank* officers to make the above indicated amendments. He was informed that only the original submitters of the sequences can make amendments to their submissions. In view of this he contacted the relevant scientists encouraging them to make the relevant amendments. As a result, the notification regarding Bryde's whale taxonomy (IWC, 2010c, p.73) was made. Amendment work by the original submitters of right and minke whale sequences is ongoing and this work will be completed during the next intersessional period.

The Committee thanked Pastene for his work in this regard.

16.3 Collection and archiving of tissue samples from catches and bycatches

The collection of tissue samples in Norway is from the commercial catches of North Atlantic common minke whales from 1997 to 2009. A total of 484 whales were landed in 2009 (see Annex N, Appendix 2).

The collection of samples in Japan is from special permit whaling in the Antarctic (JARPA II) and North Pacific (JARPN II), bycatches and strandings. The collection includes complete coverage for 2009 and the 2009/10 Antarctic season. A total of 506 genetic samples of the Antarctic minke whale and one of the fin whale were collected from the 2009/10 austral summer survey of JARPA II. From JARPN II in the western North Pacific (NP) samples stored in 2009 were: NP common minke whale, n=162; NP Bryde's whale, n=50; NP sei whale, n=100; and NP sperm whale, n=1. The samples from bycatch stored in 2009 were: NP common minke whale, n=119; NP humpback whale, n=3. Genetic samples were stored for the following stranded whales in 2009: NP common minke whale, n=3; NP humpback whale, n=1 and NP sperm whale, n=1 (see Annex N, Appendix 3).

The collection of samples from Iceland in 2009 was from commercial catches of North Atlantic common minke whales (n=81) and fin whales (n=125). Samples are currently in hand for all whales taken in 2003-09 (see Appendix 4 of Annex N).

The Committee welcomes this information from Norway, Japan and Iceland.

16.4 Reference databases and standards for diagnostic registries

Genetic analyses have been completed and data on mtDNA, microsatellites and sex entered in the Norwegian register for years up to 2007. The laboratory work on the 2008 samples is completed but has not yet been analysed. Laboratory work is ongoing for the 2009 samples (see Annex N, Appendix 2).

For the Japanese register, the genetic analyses based on mtDNA have been completed for North Pacific common minke, Bryde's, sei and sperm whales taken by special permit whaling up to 2009. Laboratory work on microsatellites for these samples is ongoing.

The genetic samples of Antarctic minke whales obtained by JARPA II have not yet been analysed, except for sex and for microsatellites of 190 samples taken in 2006-07 (six loci) and 551 taken in 2007-08 (six loci). For bycatch samples, genetic analyses based on mtDNA have been completed for all samples up to 2009. Laboratory work on macrosatellites for these samples is ongoing. Laboratory work is ongoing for stranded animals in 2009 for both mtDNA and STR (see Annex N, Appendix 3).

For the Icelandic register, genetic analyses (mtDNA and microsatellites) have been completed for common minke whales taken by special permit whaling in 2003-07. Laboratory work of samples taken under commercial whaling in 2006-09 is ongoing. Genetic analyses were completed for fin whale commercial samples collected in 2006 and 2009 (see Appendix 4 in Annex N). It was noted that only whales intended for export from Iceland were currently being genotyped for inclusion in that country's registry and that other whale samples will be genotyped as soon as possible.

The Committee **recommends** the adoption of a standard format for the updates of national DNA register to assist with the review of such updates in the future and agrees that the format used by the Norwegian registry update provides a suitable model. Pastene will work intersessionally with colleagues from Norway, Japan and Iceland to agree on the standard format. In addition, the Committee **agrees** that it would be useful to add a 'per cent completed' column for genetic analysis of tissue samples to assist in the annual review.

Whilst agreeing with these recommendations, Víkingsson reminded the Committee that Norway, Japan and Iceland are providing updates of their registries to the Committee on a voluntary basis.

The Committee noted that full technical specifications for the Japanese and Icelandic DNA registries have not been received or reviewed. Although such information is provided voluntarily, such a review would be helpful for the Committee's annual review of the status of DNA registries under its standing agenda items. The Committee recalled that updates of registers should include a list of references including the relevant documents on protocols used.

16.5 Other

SC/62/O19 describes a proposal to the IWC DAG under Procedure B, requesting access to the Japanese DNA register for the purposes of evaluating the technical aspects of traceability/trackability of sei, fin and Antarctic minke whale products purchased at commercial outlets in Santa Monica, USA and Seoul, South Korea. SC/62/O19 requested that the proposal be considered for endorsement by the Group.

The Committee could not reach an agreement on whether or not to endorse the proposal in SC/62/O19 of the current policy of Japan, Norway and Iceland regarding DNA registers access and market survey, although it recognised that the matching exercise proposed would, in principle, be valuable for testing functionality of DNA registers for identifying and tracking whale products.

16.6 Work plan

Members of the Committee were encouraged to submit papers in response to requirements placed on the Committee by the IWC Resolution 1999-8 (IWC, 2000). Results of the 'amendments' work on sequences deposited in *GenBank* will be reported next year.

17. SCIENTIFIC PERMITS (SP)

This Agenda Item was discussed by the Working Group on Special Permits in an evening session to enable all Committee members who wished to do so to attend. Bjørge was elected Chair of the Working Group. Reeves acted as Rapporteur, and the report has been directly incorporated here.

17.1 Review of activities under existing permits

All cruise reports from Japanese scientific permits from 1987 to the present are publicly available on the website of the Institute for Cetacean Research[5]. As in recent years, documents describing activities carried out in the preceding year were received by the Committee but not presented or discussed, except for points of clarification. Authors' summaries are included below. Full discussions will occur during the periodic reviews (see Item 17.3).

17.1.1 JARPN II

SC/62/O4 presented the results of the eighth full-scale survey of the Japanese Whale Research Program under Special Permit in the Western North Pacific-Phase II (JARPN II)-offshore component-, which was conducted from 10 May to 29 July 2009 in sub-areas 7, 8 and 9 of the western North Pacific. A total of five research vessels was used: one trawl survey vessel equipped with scientific echo sounder (TSV), one dedicated sighting vessel (SV), two sighting/sampling vessels (SSVs) and one research base vessel. A total of 6,374n.miles was surveyed. During that period 63 common minke, 482 sei, 93 Bryde's and 287 sperm whales were sighted. A total of 43 common minke, 100 sei, 50 Bryde's and one sperm whales was caught by the SSVs. All whales caught were examined on board the research base vessel. A total of 53 kinds of samples and data were obtained from each whale. A total of 16 skin biopsy samples were collected from blue (6), sei (9) and sperm (1) whales. As in previous surveys, common minke whales fed mainly on Pacific saury (*Cololabis saira*) and Japanese anchovy (*Engraulis japonicus*). Bryde's whales fed mainly on Japanese anchovy and oceanic lightfish. Sei whales fed mainly on copepods, Japanese anchovy and mackerels. Dominant preys in the stomach of one sperm whale were various kinds of squids, which inhabit the mid- and deep-waters. Qualitative and quantitative data on stomach contents will be used in the development of ecosystem modelling.

SC/62/O5 outlined the results of the sixth JARPN II survey (coastal component), conducted off Sanriku, northeastern Japan (i.e. the middle part of sub-area 7). The survey was carried out from 22 April to 21 May 2009 using four small sampling vessels and one echo sounder-trawl survey vessel. The research area was set within 50n.miles of Ayukawa port in the Sanriku district. The prey species survey was also conducted by the echo sounder-trawl survey vessel. A total of 4,756n.miles (464 hours) was surveyed and 111 schools (112 individuals) of common minke whales were sighted. No other large cetacean species was sighted. A total of 60 common minke whales were caught (27 males and 33 females) and landed at the JARPN II research station for biological examination. Only one individual in each sex was sexually mature. In addition the female was pregnant. The dominant prey species found in the forestomach was adult Japanese sand lances (*Ammodytes personatus*). The Japanese anchovy (*Engraulis japonicus*) and krill (*Euphausia pacifica*) were also observed but their frequency of occurrence was much lower. The prey species survey revealed high density of Japanese anchovy in the sampling area for common minke whale. These results suggest that during the 2009 survey common minke whales had prey preference for Japanese sand lance.

SC/62/O6 reported the results of the seventh JARPN II survey (coastal component), conducted off Kushiro, northeastern Japan (i.e. the northern part of sub-area 7). The survey was conducted from 5 September to 17 October 2009 using four small sampling vessels. The research area was set within 50n.miles of Kushiro port. The total searching effort by the sampling vessels was 5,136n.miles (494 hours) and 106 schools of common minke whales (107 individuals) were sighted; 59 animals were caught (36 males and 23 females) and landed at the research station. Of the males, 12 were sexually mature. None of the females sampled had attained sexual maturity. The walleye pollock (*Theragra chalcogramma*) was the most dominant prey species in the forestomach, followed by krill (*Euphausia pacifica*), Japanese anchovy (*Engraulis japonicus*), and Japanese common squid (*Todarodes pacificus*). Pacific saury (*Cololabis saira*) was not observed this year. All the animals feeding on walleye pollock were sexually immature. These results were almost the same as in the previous coastal surveys off Kushiro. The results suggest differences in feeding habits between immature and mature common minke whales off Kushiro in autumn. During the survey, other baleen whales were also sighted: 51 fin, 5 sei, and 22 humpback whales. They were observed in the vicinity of sampling positions of common minke whales that were feeding on krill.

17.1.1.1 POINTS OF CLARIFICATION

In response to a question regarding what new information of value in ecosystem modelling could be learned from the taking of one sperm whale last year (relative to the large number that had been caught and examined, with similar results regarding prey, in previous commercial whaling), the proponents stated that previous data on sperm whale diet from commercial catches were non-quantitative and did not consistently identify prey items to species level. They stated that this limited their utility in models such as ECOSIM and ECOPATH, and that data obtained from JARPN II were effectively used for ecosystem modelling. Others considered that this was not the case, and reiterated their view, and that of the JARPN II Review Panel (IWC, 2010a), that the catch of sperm whales in JARPN II is not scientifically justified.

[5] *http://www.icrwhale.org/CruiseReportJARPA.htm* and *http://www.icrwhale.org/CruiseReportJARPN.htm*.

17.1.2 JARPA II

SC/62/O3 presented the results of the third full-scale survey of the Japanese Whale Research Program under the Special Permit in the Antarctic-Second Phase (JARPA II), which was conducted during the 2009/10 austral summer season. Two dedicated sighting vessels (SVs), two sighting and sampling vessels (SSVs) and one research base ship were engaged in the research for 97 days from 14 December 2009 to 20 March 2010 in Areas III East (35°E-70°E), IV (70°E-130°E), V West (130°E-165°E) and part of Area V East (165°E-175°E). The total searching distance was 8,232n.miles. Eleven species including six baleen whales (Antarctic minke, blue, fin, sei, humpback and southern right whales) and two toothed whales (sperm and southern bottlenose whales) were identified during the research period. A total of 986 groups (2,242 animals) of Antarctic minke whales were sighted. It was the dominant species in the research area followed by the humpback whales (603 groups, 1,187 animals), and fin whales (56 groups, 186 animals). The number of sightings of the Antarctic minke whales was about 1.9 times higher than that of humpback whales in this survey. A total of 506 Antarctic minke whales and one fin whale were caught. All whales caught were examined on board the research base vessel. A total of 55 kinds of samples and data were obtained from each whale sampled. A total of 8 blue, 110 humpback and two southern right whales was photographed for natural marks. A total of 86 skin biopsy samples were collected from fin (1), humpbacks (84) and southern right (1) whales. To investigate vertical sea temperature profiles oceanographic surveys were conducted at 57 points using TDR. The main results of this survey were as follows: (1) whale composition in the research area was stable compared to previous JARPA II surveys in this area; (2) the ice-free extent of the research area was substantially larger than in past seasons and high density areas of Antarctic minke whales were observed near the continental shelf; (3) mature females of Antarctic minke whale were dominant in Prydz Bay; and (4) humpback whales were widely distributed in the research area and its density index was higher than that of the Antarctic minke whales in Areas IV West and V East. The 1994/95 IWC/SOWER cruise was conducted in similar areas and periods as in the present survey. In 1994/95 Antarctic minke whales were the most dominant species. The number of sightings of Antarctic minke whales in 1994/95 was about five times higher than that of humpback whales. According to the authors of SC/62/O3, comparison of whale abundance between these two surveys suggests that humpback whales were increasing and expanding into the research area.

17.1.2.1 POINTS OF CLARIFICATION

In response to a question on information on whether vomiting and faecal observations (SC/62/O3 table 7) referred to 'natural' events or were due to harpooning, the proponents explained that the recording of such observations was for the purpose of helping to evaluate the relative merits of lethal versus non-lethal sampling, and thus that there was no value in including observations of vomiting due to harpooning.

17.1.3 Planning for final review of results from Iceland's scientific take of North Atlantic common minke whales

Víkingsson summarised the status of Iceland's analytical work on the 200 common minke whales taken as part of its scientific research programme between 2003 and 2007; annual reports had been provided while the programme was still active. Last year it had been expected that most analyses would be completed and available in 2011; this would have allowed a formal review of the programme in 2012 following the Committee's guidelines (IWC, 2009j) provided the appropriate deadlines had been met. He reported that most of the laboratory analyses are either completed or in a final stage (see SC/62/ProgRepIceland). There had been changes and delays in some components, particularly those involving outsourced chemical analyses that required CITES permits. In addition, the serious economic difficulties experienced by Iceland in recent years have affected the programme and delayed completion of some analyses. Nonetheless, the necessary adjustments had been made to the workplan and he remained optimistic that the work would be completed on schedule.

In discussion, Víkingsson clarified that some of the analyses indicated in SC/62/ProgRep Iceland concerned species and specimens other than the 200 minke whales caught and sampled under Special Permit. Iceland's Special Permit programme had ended when the last of the 200 minke whales was taken in 2007.

In summary, an update on progress will be provided at the next Annual Meeting and approximately three months later a document will be submitted by Iceland that initiates the process leading to external review of the final results of this programme.

17.2 Review of new or continuing proposals

The Chair noted that both JARPA II and JARPN II are continuing on the basis of plans already submitted and reviewed in the Scientific Committee. There was no further discussion of this item. However, a statement in relation to this Agenda Item was received and can be found in Annex U. This statement reflects the view of many members. The response to this statement can be found in Annex U.

17.3 Procedures for reviewing Scientific Permit proposals

The Chair recalled that the Scientific Committee had spent considerable time in the past discussing this matter, and agreement on a process had been reached in 2009 (IWC, 2009j, colloquially known as 'Annex P') that had been used for the review of results of JARPN II. He noted that criticism by some members following the JARPN II review centred on how the procedures in 'Annex P' had been implemented rather than on the adequacy of the procedures themselves. Specifically, concerns had been expressed about the 'independence' of the specialists who served on the review panel, the Chair's decision not to request panel members to submit a conflict-of-interest declaration and the Chair's decision not to allow additional observers to attend the specialist workshop. The Chair noted in that regard that he also had not allowed scientists affiliated with the JARPN II programme to attend the deliberations of the expert panel.

Last year, it had been agreed to revisit at this meeting the question as to whether changes are needed to 'Annex P'. However, the Chair identified two factors weighing against the idea of having a full discussion at this time. First, given the ongoing discussions of the 'consensus package' prepared by the Commission Chair and Vice-Chair, it would be sensible to wait for outcome of those discussions before further discussion of 'Annex P'. Secondly, he believed that the dissatisfaction of some with the performance of the procedures for reviewing JARPN II was related to how these were implemented, rather than the wording of procedures themselves. In any event, Bjørge stressed that if the Committee decides to open 'Annex P' to revision, in his view such revision should be limited to only those aspects that have been controversial, i.e. the selection of experts to the review panel and the admission of observers. In discussion, it was further noted that given the schedule for reviewing the Iceland programme (as summarised under Item 17.1.3), there should be no need to implement 'Annex P' during the upcoming intersessional period. The Committee **agrees** that no further discussion of the procedures was needed at this time.

Childerhouse asked whether the adoption of a 'consensus package' would mean that Special Permit whaling would therefore end and preparations for reviews should begin. Bjørge replied that he was not in a position to advise on that, but he assumed that if the Commission reaches a decision that includes Special Permit whaling, it would then be incumbent on the Commission to provide guidance to the Scientific Committee on how permit reviews should be handled in the future.

18. WHALE SANCTUARIES

In the major discussion about sanctuaries in 2004, the Committee recommended procedures to facilitate the review of future proposals and future sanctuary reviews (IWC, 2005a, pp50-51). No new proposals for Sanctuaries were received this year. The item will remain on the Agenda for future meetings.

19. SOUTHERN OCEAN RESEARCH PARTNERSHIP

The Southern Ocean Research Partnership (SORP) was proposed by the Australian Government to the IWC in 2008 (IWC/60/16) with the aim of developing a multi-lateral, non-lethal scientific research programme that will improve the coordinated and cooperative delivery of relevant scientific information to the IWC. A framework and set of objectives for SORP were presented, discussed and endorsed last year (IWC, 2010c, pp.80-82).

At this year's meeting it was agreed to hold discussions at an evening session to allow all members who wished to attend to be able to do so without conflict with other sub-group meetings; that session was chaired by Gales and rapporteured by Childerhouse. It was agreed that the report of those discussions would be incorporated directly into the Plenary report.

19.1 Intersessional progress

SC/62/O9 reported on the intersessional progress on SORP. Progress was made on the following major items:

(1) establishment of a SORP Steering Group (SSG) with associated terms of reference;
(2) the holding of a Workshop further develop the SORP in Seattle in December 2009 (SC/62/O8);
(3) identification of seven proposed projects that will form the basis for SORP work into the future (SC/62/O10);
(4) the development of a funding mechanism for SORP projects (see below); and
(5) the holding of a first cruise of the joint Australia-New Zealand Antarctic Whale Expedition, AWE (SC/62/O12).

These items are covered in more detail below. It was noted that a full discussion of SC/62/O12 had taken place in the sub-committee on Southern Hemisphere whales (Annex H). The brief discussion under the present item focussed on suggested improvements in future cruises related to estimating abundance, the representativeness of the study area, the use of faecal sampling, the effect of satellite tagging on animals and some comments on the ability of the project to meet its objectives.

19.2 Report of the SORP Workshop, Seattle, December 2009

The SORP workshop (SC/62/O8) was hosted and supported by the Government of the USA and attended by 15 people from five nations. Its main aims were to continue developing the mechanism by which SORP would conduct its business and achieve its objectives. The workshop agreed that a focused approach to the research was required and this was best achieved through the development of research projects that were consistent with both the agreed SORP objectives and priority issues identified by the IWC Scientific Committee. To address this latter issue, a summary document of recommendations relevant to the Southern Ocean had been compiled. The proposed draft SORP projects that were developed at the workshop are described below.

19.3 Summary and consideration of proposed SORP projects

Several draft research projects were presented to the Committee in order to obtain comments and advice (SC/62/O10). The selection process had followed a lengthy consultation process starting at the Sydney SORP workshop (Southern Ocean Research Partnership, 2009) where broad themes were developed and these themes were endorsed by the Committee last year (IWC, 2011). *Inter alia* these draft projects developed at the Seattle SORP workshop are those that were considered to benefit from large scale, multi-regional participation and were consistent with both SORP objectives and IWC priority issues. The purpose of presenting these draft projects to the Committee this year was to seek initial comments and perhaps general endorsement of the overall approaches. The intention is that the project leaders will take any comments made into account when developing the projects intersessionally. It was clarified that there was no intention for the Committee to approve the draft budgets appended to the projects at this stage. These and other aspects of the proposals would require further development and should be re-submitted using the agreed funding mechanism (see Item 19.4) at the 2011 Annual Meeting.

19.3.1 Killer whales in the Southern Ocean

A short project description of 'Distribution, relative abundance, migration patterns and foraging ecology of three ecotypes of killer whales in the Southern Ocean' was presented. There are three ecotypes of killer whales described from Antarctic waters. Little is known about these ecotypes and it is important to understand these populations as killer whales play a key role in the Antarctic marine ecosystem. This is especially true with respect to the impacts that they have on prey populations including marine mammals, fish and penguins.

This project will investigate factors related to their ecosystem impact in Antarctica and adjacent waters, by focusing on their systematic relationships, abundance, distribution, movement patterns and prey preferences. It will include analyses of lipid, isotopes and contaminants from biopsy samples. Collaborators are from USA, Brazil, France and Brazil/Canada.

In discussion, it was agreed that this was an ambitious and valuable project outline. It was noted that the proposal required considerably more detail on the proposed analytical methods before it can be properly evaluated and that this was true for most of the draft projects presented. It is also important that any final proposal includes information on the conceptual and analytical and framework linking the sub-projects together. Suggested additional potential collaborators included Lauriano from the Italian Antarctic Programme and Bester from South Africa who is undertaking related work at Marion Islands.

19.3.2 Foraging ecology and predator prey interactions of whales and krill

A short project description of 'Foraging ecology and predator/prey interactions between baleen whales and krill: a multiscale comparative study across Antarctic regions' was presented. Little is known about the dynamics of predator-prey interactions and the response of baleen whales to the distribution of their prey in the Antarctic. As an important marine ecosystem (e.g. with respect to issues of climate change impacts as well as international management of marine living resources), research focused on cetacean foraging ecology in the Antarctic should help to fill a critical data gap. The project will use novel tagging technologies combined with traditional scientific hydroacoustic methods to quantify the types and frequency of prey consumed and daily consumption rates of poorly understood yet ecologically integral and recovering krill predators in the Antarctic: the humpback whale and the Antarctic minke whale. Collaborators are from USA and Australia for phase 1 and potentially Brazil, South Africa and Germany for phase 2.

In discussion, it was noted that this was an ambitious and valuable project. In addition, the proposal generally provides a good example of the level of detail required to allow for a full scientific evaluation. There were some methodological issues that required additional thought, including how the results from detailed studies collected at a fine spatial scale would be expanded to the medium and large scale, and also about the reliability of the method for estimating gulp volume. In response, it was noted that this project represents a step along the line in estimating consumption rates and that moving out from very fine to middle to large scale will be represent a challenge and needs further consideration. The similarity between aspects of this project and the Committee's SOWER 2000 project (IWC, 2000) developed but never implemented was noted and it was suggested that this may provide some useful additional ideas and information for the developers of the current project.

19.3.3 Oceania humpback mixing

A short project description of 'What is the distribution and extent of mixing of Southern Hemisphere humpback whale populations around Antarctica? Phase 1: East Australia and Oceania' was presented. An improved understanding of the movements and mixing of humpback whales around Antarctica has been identified as a priority for the Committee as part of its Comprehensive Assessment of Southern Hemisphere stocks. This information is integral to assessing the recovery of depleted populations. A key step in assessing recovery is estimating pre-exploitation size which requires knowledge of stock identity and appropriate allocation of historic catches to correct stocks. An improved understanding of the migratory and feeding behaviour of humpback whales should allow an appropriate allocation of catches made in this region to breeding stocks, which will improve the accuracy of recovery assessments and estimates of pre-whaling population sizes. Collaborators include New Zealand, Australia, USA, France, Samoa, Tonga and Chile.

In discussion, it was noted that when exploring allocation of past catches to breeding stocks, additional information would need to be considered given the potential temporal and spatial mixing of different breeding stocks and sexes on the feeding grounds and given the relatively small number of SOWER/IDCR samples available from this region. Similar work was being undertaken by other researchers (e.g. low to high latitude matches from Japanese and SOWER/IDCR data sets) which would help broaden the context for this work. It was noted that the outline study presented represents only Phase One; the focus is on Oceania and will include all the SOWER/IDCR data available. Future work is already being planned and there are plans to collaborate with researchers across the Southern Hemisphere (e.g. Africa, Chile, Brazil, Australia) using both mitochondrial and microsatellite data. It was suggested that the telemetry component of the study would be better structured if animals were tagged on the feeding rather than breeding grounds as this would provide more information on mixing. In response, it was noted that this had been the plan of the AWE but due to technical failure with the tags this had not been achieved. The issue of collaboration and inclusiveness was raised (as it had been at the IWC workshop on Southern Hemisphere humpback whales held in 2006) and it was noted that the proposal did not include all potentially valuable datasets. The Committee agreed that it was important that SORP projects are open to all researchers who hold appropriate datasets.

19.3.4 Fin and blue whale acoustics

A short project description of 'Acoustic trends in abundance, distribution, and seasonal presence of Antarctic blue whales and fin whales in the Southern Ocean' was presented. This initiative aims to implement a long term acoustic research programme that will examine trends in Southern Ocean blue and fin whale population growth, distribution, and seasonal presence through the use of passive acoustic monitoring techniques. Current understanding of blue and fin whale life history characteristics, population abundance, and any post-whaling recovery is extremely limited. While obtaining accurate absolute abundance estimates is currently beyond the reach of passive acoustic methods, measures of relative abundance and trends are more easily obtainable and can be conducted in a consistent manner. Comparison of relative abundance estimates from individual locations across many years collected by acoustic surveys can provide a precise measure of population growth. Comparison of relative abundance estimates within and between locations and years can further be used to assess trends in distribution and seasonal presence over time. Collaborators are from Australia, France, USA and Germany.

In discussion, it was noted that the primary focus was on the Indian Ocean. The Committee agreed that it would be useful to consider including similar acoustic data from other sources (e.g. the GLOBEC acoustic data that had been collected for six years at the Antarctic Peninsula) and was pleased to hear that the inclusion of such data is planned and that GLOBEC researchers will be approached soon. The plan to develop less expensive acoustic loggers was welcomed as an excellent step forward in the use of acoustics as a tool for monitoring. There was some thought that the timetable to complete the feasibility stage of the project (one year) may be too ambitious. As for other projects, more detail of the analytical methodology was requested. In terms of assessing the extent to which the project would meet its objectives (i.e. estimation of trends), it was noted that it would be helpful to see the detection range of the loggers as the small number of loggers planned to be deployed would cover a relatively small part of the Southern Ocean. It was recognised that complete coverage of the South Ocean was not possible given logistical constraints (i.e. the limited number of vessels in the area and where they go) but part of the future planning was to consider the best sites for deployment to maximise the usefulness and representativeness of those sites and to try and capture representative variability. It was suggested that it would be useful for the loggers to collect environmental as well as acoustic data which would help to provide context for any variability seen, provided this could also accommodate the objective of keeping the units small and affordable. The Committee noted that using such data to estimate absolute abundance is a long term and extremely ambitious objective of the project. The project leaders acknowledged that this would not be easy, noting that the project would start by estimating relative abundance to quantify trends and work towards absolute abundance. With respect to the long-term aim, it was suggested that the developers of the programme approach scientists such as Len Thomas (University of St Andrews) who had made some progress in the development of new analytical approaches to estimate density from acoustic data.

19.3.5 Year of the Blue Whale 2013/14

As one of the major initiatives within the SORP, the Committee discussed a proposal for a multi-vessel, circumpolar research project to focus on Antarctic blue whales in the austral summer of 2013/14. The proposed objectives for this 'Year of the Blue Whale' would be to:

(1) provide a circumpolar abundance estimate of Antarctic blue whales based on data collected during a single-season, multi-vessel survey design that incorporates acoustic localisation of blue whales and traditional sightings surveys;
(2) improve our understanding of Antarctic blue whale stock structure through the collection of genetic, photographic and acoustic data;
(3) improve understanding of linkages between blue whale feeding and breeding grounds using satellite telemetry; and
(4) characterise foraging habitat of blue whales on the basis of sightings surveys and satellite telemetry data.

It was recognised that any research effort to satisfy these ambitious objectives in a single year of field work will require substantial methodological development (e.g. to determine how to combine visual and acoustic survey techniques) as well as a need to build in provisions for substantial 'off-survey' activities (e.g. satellite tagging, biopsy sampling and individual photo-id). The project will also require substantial logistical planning to access and coordinate shipping and research activities around Antarctica within a single season. It had been proposed that a small scientific steering committee be established with the task of: (1) developing a full research proposal for the Year of the Whale; (2) determining the optimal scale of shipping and research effort required to fulfil the objectives; (3) initiate processes towards accessing these shipping resources; and (4) reporting back to the 2011 Annual Meeting.

In discussion, there was broad agreement about the general concept and draft proposal and several members expressed an interest in participating in planning for the SORP Year of the Whale. There was a short discussion of a suggestion that fin whales could be included in the proposal but it was noted that high density areas of blue and fin do not always overlap and that to include fin whales might dilute the effort with respect to blue whales. The Committee agreed that the inclusion of other species, while desirable, must be considered in light of the primary objective of assessing blue whales. Recent experience during the AWE had demonstrated that acoustics was a practical method of finding blue whales and that this would allow a blue whale cruise to minimise the amount of time searching and maximise the amount of time spent with blue whales. Recognising the ambitious nature of the project, it was suggested that the timeframe of 2013/14 was optimistic and that a delay in 1-2 years might be considered, given the enormous coordination and organisational effort required to ensure the success of such a large project. Consideration may also need to be given to spreading effort out over two years. The Committee **agrees** that until the proposal is more fully developed, it will not be possible to assess the logistical requirements necessary to complete the work. It was suggested that a small group of survey and other specialists, including those familiar with organising large multi-vessel multinational projects, should work together to further develop the proposal and report back to the SSG and the Committee next year (see Item 21); Gales agreed to co-ordinate this. Their task would *inter alia* be to determine the level of resources required, provide an outline of research methods (and analyses) and survey design, and assess the feasibility and timeframe of the project (if that group deemed it necessary, a short workshop might be considered).

19.3.6 Whales and climate change

This project has been identified as a potential project since the Sydney SORP workshop and it has been further discussed at the second IWC climate change workshop (IWC, 2010c), last year's Scientific Committee meeting and the recent Seattle SORP workshop. Long-term southern right whale datasets have been identified as the most likely existing data for correlation with long term climate changes. Leaper *et al.* (2006) demonstrated the utility of the long-term Argentinean study for assessing correlations with climate variables. It has been proposed that a project along these lines could be developed using a common method that can be applied to the Australian, South African and Brazilian long-term datasets, provided an initial examination revealed them suitable for this purpose. In this regard, consideration should be given to the development of recommendations about how existing programmes/datasets could be improved/modified to make them more suitable for future work along these lines.

As the Committee has previously recognised, an understanding of these issues requires long-term data on prey and/or climate as well as long-term whale data; this will require incorporation of relevant experts in these fields in the project. The Committee also agreed that it was worth examining the potential use of time series of whale oil production, provided that suitable climate data over the same period can be found. Investigation of long-term datasets from other species in the same ecosystem could also be valuable. The Committee **agrees** that formal proposals for work under a climate change project would be welcome for consideration at the 2011 Annual Meeting.

19.3.7 Non-lethal research techniques workshop

This proposal is for a technical conference/workshop to review the strengths and weaknesses of available non-lethal research methods for studies of living whale in the Southern Ocean and their ecological roles in the Southern Hemisphere. The objectives are to advance the synergies of non-lethal methods for investigations addressing a range of research themes. Presentations at the workshop will focus on methodological or technological advances to non-lethal methods, including those that are still under development, or with specific applications to populations in the Southern Hemisphere. Preliminary planning has been undertaken and it is likely to be held in Chile in late 2011.

It was suggested that the workshop could take place in association with the proposed Assessment workshop on southern right whales planned for Argentina in September 2011. A draft Agenda for this workshop can be found in Annex R.

19.4 Funding mechanism for SORP

The Committee **endorses** the process for evaluating requests for funding under the IWC/SORP research fund given in Annex R. It agrees that the IWC Head of Science and Chair of Scientific Committee should be included in the SORP Steering Committee.

20. ACTIONS ARISING FROM INTERSESSIONAL REQUESTS FROM THE COMMISSION

As part of the Commission's work on the Future of the IWC, the Chair and the Vice-Chair of the Commission, based on discussions within the Chair's Support group and the Small Working Group on the Future of the IWC, developed the 'Proposed Consensus Decision to Improve the Conservation of Whales'. The Committee received a short PowerPoint presentation explaining the background to the document, focussing on issue of relevance to the Scientific Committee. In particular, the Committee was asked, via the Small Working Group on the Future of the IWC, to provide scientific advice on a number of aspects of the proposed Consensus Decision; the Terms of Reference for our work are given in Annex G of IWC/62/6 rev. They are also given as Annex S to this report.

The parts of the report requiring review and advice, along with the sub-groups of the Committee that took the initial review can be summarised as follows:

(1) Review of Annex {DNA} on DNA registers and market sampling – jointly by the Working Group on DNA and the Working Group on the estimation of bycatch and other human induced mortality – see Annex N, item 9;
(2) Reviews of Annex {SI} on scientific information required from the catch and Annex {OI} review of operational information – the sub-committee on the RMP – see Annex D;
(3) Review of the potential workplan for the Scientific Committee – relevant sections were reviewed by the sub-committee on the RMP and the sub-committee on in-depth assessments (Annexes D, and G, respectively); and
(4) Review of the report of the Scientific Assessment Group (IWC/M10/SWG6) in the light of the numbers in table 4 of IWC/62/7rev (the table of catch limits) - relevant sections were reviewed by the sub-committee on the RMP, the working group on the *pre-Implementation assessment* of common minke whales in the western North Pacific, the sub-committee on in-depth assessments, the sub-committee on other Southern Hemisphere whale stocks (Annexes D, D1, G, and H, respectively).

The discussions within the sub-committees form the basis of the Committee's advice given below.

With respect to tasks (1)-(3) above, the complete Annexes incorporating our recommendations are included in Annex T, as is an updated timetable.

20.1 Review of Annex {DNA} on DNA registers and market sampling schemes

The Committee was requested to review Annex {DNA} of IWC/62/7rev for clarity and completeness. Annex {DNA} of IWC/62/7rev is based on the report of an earlier specialist workshop held from 7-9 March 2005 (IWC/M05/RMSWG 5). The objective of the review is to ensure that the Annex remains a cost-effective, robust, independent and transparent system in conjunction with the other monitoring and control measures.

To address the above objectives, the Committee **recommends** that the text given in Annex S replaces Annex {DNA} of IWC/62/7rev. Here follows a summary of the recommended changes.

1. SPECIFICATIONS FOR THE ESTABLISHMENT/MAINTENANCE OF A DIAGNOSTIC DNA REGISTER/TISSUE ARCHIVE

1.1 Laboratories

1.1.1 Minimal laboratory requirements

1.1.1 (6)	to clarify the length of time that archived samples were to be stored;
1.1.1 (7)	to clarify requirements that a variety of error-checking procedures should be followed and that sample quality should be checked routinely prior to genetic analysis.
1.1.1 (9)	to take into account several different factors in calibration exercises.
Footnote text	a more comprehensive definition of 'diagnostic DNA register'.

1.2 Sample collection

1.2.1 Size of the samples

1.2.2 Preservations

1.2	to specify training of and information to be collected by persons who may be involved in the collection of genetic samples for DNA registries other than commercial, scientific and indigenous catches (e.g. bycatches or stranded animals).
1.2.1 and 1.2.2	to clarify the sample preservation requirements.

1.4 Markers and methods of analysis

1.4.1 Mitochondrial DNA

1.4.2 Microsatellites

1.4.3 Sex identification

1.4.1, 1.4.2 and 1.4.3	to clarify that the analytical methods adhering to the quality standards as specified in the IWC genetic data quality guidelines must be approved by the international expert group.

1.7 External audit of DNA registers

1.7	to specify that the international expert group shall submit an annual report to the Secretariat of the IWC for distribution to contracting governments and the Commission (and, if necessary subsidiary bodies of the Commission) at least two months before it must be considered.

1.8 Submission procedure for samples for comparison with registers

The Committee considered all of section 1.8 in light of the stated objective of Annex {DNA}: 'to ensure a robust, independent and transparent system'. Item 1.8 makes a crucial contribution to these objectives, by providing a mechanism for sample verification that is not reliant on national market sampling schemes, and is also not reliant on the international expert panel, whose role is to audit the system rather to focus on individual samples. The Committee **agrees** that the current wording of item 1.8 does not fully make clear the intent of the mechanism and has thus provided new clarifying wording (including in the heading).

It also **agrees** to a new item 1.9, to specify the submission of DNA profiles to the IWC' central register from contracting governments under whose jurisdiction whales and whale products may be legally marketed.

2. SPECIFICATIONS FOR THE ESTABLISHMENT/ MAINTENANCE OF MARKET SAMPLING SCHEME
2.2 Development of appropriate market sampling schemes including audit

New 2.2 (4)	to take into account that some 'degraded' and/or 'processed' samples from market surveys could not be analyzed using exactly the same procedures as those currently used for 'fresh' and 'unprocessed' samples, but that methods could be developed to allow accurate comparison of such samples with profiles in DNA registries.

2.4 Reporting

2.4	a slight revision of the text concerning reporting to the IWC by the international expert group: the international expert group shall submit an annual report to the Secretariat of the IWC for distribution to contracting governments and the Commission (and, if necessary bodies of the Commission) at least two months before it must be considered.

20.2 Review of Annex {SI} to IWC/62/7rev – scientific information requirements

The draft Annex was based on previous recommendations of the Committee in the context of RMS discussions (IWC, 1995d). The Committee reviewed the Annex. In discussion it was recalled that the Committee has previously agreed that bulla do not provide a reliable means for estimating age (IWC, 2002c, p.12). It also noted that earplugs do not provide reliable age estimates for North Atlantic common minke whales. Walløe and Víkingsson reported that lengths could not always be recorded for minke whales in North Atlantic in the manner specified, although estimates of length are reported to the Secretariat.

Given the above the Committee **recommends:**

(1) reference to 'bulla' be removed from point 2(b); and
(2) the following footnote be added to point (a) 'Onboard small coastal whaling vessels such as those participating in Norwegian and Icelandic operations, it may be difficult to obtain accurate length measurements because whales are handled on a limited space. It is recognised that measurements in these cases may not be as accurate as those taken in ideal situations.'

The full revised Annex is given as Annex T.

20.3 Review of Annex {OI} to IWC/62/7rev – operational information requirements

The Committee **endorses** the operational information requirements as given in the proposed Annex.

20.4 Review of proposed timetable for future *Implementations* and *Implementation Reviews* (IWC/62/7rev Appendix B, p. 37)

The Committee **concurs** with the SAG that the schedule in Section 5 of IWC/62/7rev, updated following its deliberations as Table Y below, is ambitious. It noted that *Implementations* and *Implementation Reviews* can (and do) involve considerable time and resources from national scientists and, especially in cases when *Implementation Simulation Trials* are required, the Secretariat. Moreover, delays can occur when conducting *Implementations* given that the same members of the Committee are involved in many of the *Implementations* and *Implementation Reviews*.

The Committee has previously agreed that it can only conduct one *Implementation* at a time. The schedules for Western North Pacific Bryde's whales, and for North Atlantic common minke and fin whales given in IWC/62/7rev match the schedules expected from the *Implementations* for these species in terms of the Committee's agreed guidelines (IWC, 2005b). The Committee has previously been able to complete an *Implementation Review* during a single meeting, provided that no *Implementation Simulation Trials* are required.

The Committee therefore cannot conduct *Implementations* for Western North Pacific sei and Antarctic minke whales at the same time. The SAG had considered it more important to conduct an *Implementation* for Western North Pacific sei whales first given the size of current catches and the estimates of abundance for this stock. However, the Committee noted that there are also reasons to conduct an *Implementation* for Antarctic minke whales starting in 2012. After discussion of the relative amount of preparatory work required for *In-depth* and *pre-Implementation assessments* of North Pacific sei whales compared to Antarctic minke whales, the Committee **recommends** to deal with North Pacific sei whales before minke whales, as in IWC/62/7rev, and further **recommends** the schedule given in 20.5.3.4 below.

The Committee **recommends** that two years should be allowed for the *pre-Implementation assessment* for Antarctic minke whales irrespective of when the *Implementation* for these whales starts (under the current schedule, the first year of the *pre-Implementation assessment* would be 2014). It was also recognised that the current *Implementation* for these whales is sufficiently dated (1993) that it was unreasonable to expect that this 1993 *Implementation* can simply be reviewed after almost 20 years of developments in how to *Implement* the RMP.

The Committee therefore **recommends** that '/IR' (for *Implementation Review*) be deleted from the box for 2015 for Antarctic minke whales.

20.5 Review of the Scientific Assessment Group (SAG) Report

As part of the Commission's discussions on the Future of the IWC, the Commission's Chair and Vice-Chair developed the document 'Proposal Consensus Decision to Improve the Conservation of Whales' (IWC/62/7rev). During the development process but before finalisation of IWC/62/7rev, a small Scientific Assessment Group (SAG) was established to provide a report (IWC/M10/SWG6) of a concise scientific review on whether proposed catches were such that the long-term status of the populations concerned would be negatively affected. The numbers in table 4 of the proposed consensus decision (i.e. proposed whale catches for the period 2010/11-2019/20) are below those considered by the SAG. The terms of reference developed by the Small Working Group on the Future of the IWC (SWG) for the Committee's review of the SAG report in the light of the numbers in table 4 of IWC/62/7rev are given in Annex S and summarised below.

The Committee shall follow the terms of reference of the SAG (IWC/M10/SWG, Annex B), recognising:

(a) the need to be concise;
(b) the fact that there are a number of different approaches to evaluating short-term catches and no single method will be appropriate in all circumstances; and

(c) that the report should provide an integrated, pragmatic view on whether or not the proposed short-term catches (i.e. before the RMP can be used) are likely to negatively affect the long-term (i.e. RMP simulation framework timeline of 100 years) status of the stock *given* the timetable for RMP work.

It had also been requested that the Chair of the Scientific Committee should ensure that the time spent on this review should be such that it does not interfere with the Committee's focus on completing RMP-related work as soon as possible.

The SAG had noted that there were two categories of stocks for which advice was required: those for which the RMP could be applied immediately, and those for which it could not. The report below follows a similar pattern, focussing initially on the application of the RMP (western North Pacific Bryde's whales, North Atlantic common minke whales, North Atlantic fin whales) and then turning to those stocks for which it cannot immediately be applied (Antarctic minke whales, Southern Hemisphere fin whales, western North Pacific common minke whales, and western North Pacific sei whales).

20.5.1 General issues related to using the RMP

20.5.1.1 CATCH LIMIT CALCULATIONS (ACTIVATION, YEARS, INPUTS AND OUTPUTS)

As part of the SAG process, the RMP was applied to three species-Region combinations (western North Pacific Bryde's whales; North Atlantic minke whales; and North Atlantic fin whales) upon instruction from the Chair of the Commission. The calculations reported are therefore the results of applying the RMP itself, although results are also shown for tunings other than the Commission-agreed 0.72 tuning (the 0.6 tuning). The Committee repeated the RMP catch limit calculations for these stocks. Differences from the SAG's calculations are documented in the following sections. When applying the *CLA*, the phase-out rule was applied for each *Small Area* after the catch limit was cascaded to the *Small Areas* from the *Medium Area* rather than applying the phase-out rule before cascading the *Medium Area* catch limit to *Small Areas*, in accordance with RMP specifications (RMP specification 3).

20.5.1.2 TUNING LEVELS

The SAG report (and Annex D, Appendix 8) provides results for the 0.72 and 0.6 tunings of the RMP because the whaling countries in the Commission's support group had requested the latter tuning. This issue is discussed more fully in the SAG report.

The Committee noted that although the 0.6, 0.66 and 0.72 tunings of the *CLA* were recommended to the Commission by the Committee, having been subjected to testing during the development of the RMP, the *Implementation Simulation Trials* have only been conducted by the Committee for the 0.72 tuning of the RMP. Norwegian scientists have run the *Implementation Simulation Trials* for minke whales in the Northeast Atlantic for the 0.6 tuning of the RMP, but these calculations were not undertaken nor reviewed in detail by the Committee. In addition, which RMP variants are 'acceptable' may change if the tuning level is changed. The Committee **agrees** that the tuning level which was used when calculating catch limits using the *CLA* should be that which is tested in *Implementation Simulation Trials*; in this case only the 0.72 tuning. In principle, the *Implementation Simulation Trials* could be repeated for a new tuning if requested by the Commission. However, the criteria used to evaluate whether performance of an RMP variant is 'acceptable', 'borderline' or 'unacceptable' is linked to the 0.6 and 0.72 tunings of the RMP. The present criteria may need to be investigated if the Commission requested that a different tuning of the RMP should be considered.

20.5.1.3 OTHER ISSUES

The Committee notes that its advice is based on the schedule of RMP *Implementations* proposed in Appendix B of the Chair's and Vice-Chair's proposal (IWC/62/7rev). The Committee brings to the attention of the Commission its concern that delays in completion of these implementations may increase risks to whale populations. Attention is drawn to the two-year schedule for completion of an *Implementation* as set out in the Committee's agreed guidelines (IWC, 2005b) - proposals made in this report follow from the Committee's intent to progress work in terms of this schedule.

On a more general issue, the Committee draws the Commission's attention to the fact that the RMP and AWMPs are designed to provide advice on catch and strike limits for periods of up to 6 years. Further work may be needed to assess the risks associated with setting catch limits for longer periods than 6 years.

20.5.2 Application of Stocks/Regions for which the RMP can immediately be applied

The Committee reviewed the specifications (provided by the Secretariat) of how the RMP was applied during the SAG meeting to western North Pacific Bryde's whales, North Atlantic minke whales, and North Atlantic fin whales. The following items summarise the modifications to the initial applications by the Secretariat made by the Committee in reaching its agreed applications: these primarily involve clarifications with respect to time-stamps of abundance estimates and the addition of newly agreed abundance estimates. Table 7 lists the resulting catch limits from the 0.72 and 0.6 tunings of the *CLA*. The format used to document the input and present the results (see Annex D, Appendix 8 for the final format) illustrates the calculations made, and emphasises the results calculated using the Commission-agreed 0.72 tuning.

20.5.2.1 WESTERN NORTH PACIFIC BRYDE'S WHALES

The application of the RMP to western North Pacific Bryde's whales was based on a single abundance estimate for the *Region* (time-stamped at 2000). The Committee requested that the time-stamps for the *Small Areas* when applying catch cascading be set to the effort-weighted years.

It was noted that survey data were available for 1988-96 and some of these data were used when computing the additional variance for the 1998-2002 surveys (Shimada *et al.*, 2008). An abundance estimate can be computed for 1988-96, but the Committee has only accepted the estimate from the 1998-2002 surveys (IWC, 2009b). Although abundance estimates could be calculated using the 1988-96 data, account would need to be taken of the correlation of these estimates with those for 1998-2002 if they were included in RMP calculations of catch limits. However, the presently-coded version of the RMP does not allow input of a variance-covariance matrix for the abundance estimates. The Committee therefore **recommends** that:

(1) the program for the *CLA* be modified to allow variance-covariance matrices to be input (Annex D, item 2.4); and
(2) the data and resulting abundance estimates from the 1988-96 surveys should be reviewed for possible use in the RMP during the next *Implementation Review*.

Table 7

Summary of the application of the RMP (full details of the inputs to the RMP as well as relevant intermediate calculations are given in Annex D, Appendix 8). Phaseout has been applied where applicable.

Year	WNP Bryde's whales	North Atlantic fin whales		North Atlantic minke whales					
Sub-area	1W+1E	WI (variant 6)	WI (variant 2)	CIC	CM	ES	EB	EW	EN
Catch limits based on the 72% tuning (Commission's agreed value)									
2010	**5**	**46**	**87**	**224**	**135**	**58**	**92**	**152**	**70**
2011	**3**	**46**	**87**	**224**	**135**	**58**	**92**	**152**	**70**
2012	**1**	**46**	**87**	**224**	**135**	**46**	**92**	**152**	**70**
2013	**0**	**46**	**87**	**224**	**135**	**35**	**92**	**152**	**56**
2014	**0**	**46**	**87**	**224**	**108**	**14**	**92**	**152**	**42**
Catch limits based on the 60% tuning									
2010	33	90	155	345	208	122	195	322	148
2011	19	90	155	345	208	122	195	322	148
2012	4	90	155	345	208	97	195	322	148
2013	0	90	155	345	208	73	195	322	118
2014	0	90	155	345	166	29	195	322	89

The final specifications for how the RMP was applied to these whales are listed in Annex D, Appendix 8A.

20.5.2.2 NORTH ATLANTIC MINKE WHALES

The Committee **recommends** the following changes to the abundance estimates for minke whales in the Central North Atlantic:

(1) use the estimates in Annex D, Table 1 to construct an abundance estimate for *Small Areas* CG+CIP and include this abundance estimate in that for the C *Medium Area* for 2006;
(2) use the estimate for the CM *Small Area* in 2005 of 12,043 (CV 0.28) in place of the estimate of 6,174 (CV 0.36) because the former estimate is based on surveys which covered more of the CM *Small Area*; and
(3) use the revised version of the estimate of abundance for 2005 of 26,739 (CV 0.39) in place of the estimate of 24,890 (CV 0.45);

Allison recalculated the CVs for the abundance estimates for the C *Medium Area*.

The Committee **recommends** that the catch limits for the minke whales in the eastern North Atlantic be based on the latest sex ratio data (i.e. 2005-09) rather than 2004-08 as was used for the SAG report. The final specifications for how the RMP was applied to North Atlantic minke whales are listed in Annex D, Appendix 8B.

20.5.2.3 NORTH ATLANTIC FIN WHALES

The Committee had no changes to the application of the RMP used in the SAG report. The specifications for how the RMP was applied to North Atlantic fin whales are listed in Annex D, Appendix 8C. As noted under Item 6.2.1, the Scientific Committee has already confirmed that *Variant 2* would be acceptable for 10 years, followed by *Variant 1*, if accompanied by an acceptable research programme. No final research proposal to distinguish between stock structure hypotheses has yet been adopted. Therefore, *Variant 2* is not an available option at this time. However, a preliminary proposal was submitted and discussed at this meeting. The Scientific Committee made two specific recommendations for improvement. The proposal will be modified accordingly, in consultation with an advisory committee appointed by the Scientific Committee, and submitted to the next Annual Meeting for adoption.

20.5.3 Advice on Stocks/Regions for which the RMP cannot immediately be applied

20.5.3.1 ANTARCTIC MINKE WHALES

Information on the timetable for undertaking an *Implementation* of Antarctic minke whales is given under Item 20.4. If this timetable can be met, it is expected to be completed in 2016.

20.5.3.2 SOUTHERN HEMISPHERE FIN WHALES

Section 2.6 of IWC/M10/SWG6 considered Southern Hemisphere fin whales. It is proposed that catches would be taken alternately in the Indian Ocean (between 35°E-130°E) and Pacific Ocean (between 130°E and 145°W) sectors of the Antarctic. A total of 10 annual catches would be taken in the period 2010/11-2012/2013, starting in the Pacific Ocean sector. Catches would be reduced from 10 to 5 individuals from 2013/14 until 2019/2020.

The Committee noted that in the past there was extensive exploitation (nearly 750,000 fin whales were killed in the 20th Century), and that recent information on fin whales in the Southern Hemisphere is poor. The Committee also noted that there were additional abundance estimates for this population, derived from IDCR/SOWER surveys, which had not been considered by the SAG (e.g. Branch and Butterworth, 2001a; Butterworth and Geromont, 1995). Branch and Butterworth (2001) estimated that the circumpolar abundance of fin whales south of 60°S was 2,100 (CV=0.36), 2,100 (CV=0.45) and 5,500 (CV=0.53) for CPI, CPII and CPIII respectively. These estimates are negatively biased since the areas north of 60°S were not covered[6].

It is unlikely that sufficient information will become available in the interim period (up to 2020) for an RMP *Implementation* to occur. Nevertheless, some members noted that if the *CLA* of the RMP was used it would result in a catch limit of 0. The Committee **concurs** with the general conclusions of the SAG, i.e. that it is unlikely that the proposed catches will affect the long-term status of the stock[s]. Some members were concerned about providing *ad-hoc* advice on catch limits without any likelihood of a formalised procedure being available in the foreseeable future. They did not want this exercise to set a precedent for providing *ad-hoc* advice.

[6]IWC (1996b) reports IDCR estimates extended to south of 30°S by using Japanese Scouting Vessel survey results to provide an index of relative abundance.

20.5.3.3 WESTERN NORTH PACIFIC COMMON MINKE WHALES

Information on the timetable for undertaking an *Implementation Review* of western North Pacific common minke whales is given under Item 20.4. Given the progress made at this meeting (see Annex D1), it is expected that this will be completed in 2012.

The Committee noted that it was not possible to apply the RMP to the data for these minke whales owing to the considerable changes to the understanding of stock structure in recent years. It **agrees** that the present uncertainty precludes giving adequate advice regarding the catches in Table 4 of IWC/62/7rev The Committee generally **agrees** with the conclusions of the SAG; the Committee summarised its conclusions as follows.

(1) The *Implementation* process should be completed as quickly as possible. Completing the *Implementation Review* will allow advice on catches to be based on the RMP, which has been selected to ensure that catches are sustainable.
(2) A high priority should be accorded to research to determine the proportions of 'O' and 'J' stock in sub-area 12 because the implications of any proposed catches for both 'O' and 'J' stock clearly differ depending on this proportion. In this respect, the Committee welcomed the survey of sub-area 12 planned for summer 2010 and **emphasises** the importance of collecting as much data as possible to estimate stock proportions in sub-area 12.
(3) The proposed catches by coastal whalers in Table 4 of IWC/62/7rev may not help to improve the status of 'J' stock compared to current JARPN II catches. The incidence of 'J' stock in the catch decreases with distance offshore. The Committee received an analysis which estimated the number of 'J' stock animals under catch levels of 150 inshore and 70 offshore (Annex G1, Appendix 8). The Committee recognised the value of analysis such as those in Annex G1, Appendix 8 and **recommends** that further analyses be conducted using a finer spatial resolution and quantifying the uncertainty associated with the predictions, including the likely level of inter-annual variation in catches of 'J' stock animals.
(4) The Committee was unable to agree on the impact of the proposed catches on the 'O' stock. However it **agrees** that the risk to the 'O' stock will be minimised if the *Implementation Review* is completed as soon as possible so that advice can be based on the RMP and hence also **agrees** that catches of 'O' stock should not exceed present levels.

Table 8

Scientific Committee work plan for RMP *Implementations.*

	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	202
Western North Pacific Bryde's whales				IR					IR		
NA common minke whales - eastern and central medium areas					IR						IR
NA fin whales - central medium area					IR					IR	
Western North Pacific common minke whales	PIA		RMP	[RMP]					IR		
Western North Pacific sei whales		IDA		PIA	RMP	[RMP]					IR
Antarctic minke whales					PIA	PIA		RMP			

IR= *Implementation Review* (often possible to complete in one year). PI = *pre-Implementation assessment* (may take more than one year). RMP completed *Implementation* (takes two years once the PIA is completed IDA= in-depth assessment, usually takes two years or more and feeds in a *pre-Implementation assessment.* As explained in the text, the plan ambitious and it may not be possible to achieve all of the work by th years indicated. Square brackets are used to express possible but perhap less likely dates.

20.5.3.4 WESTERN NORTH PACIFIC SEI WHALES

Information on the timetable for undertaking an *Implementation* of western North Pacific sei whales is given under Item 20.4. If the *Implementation* turns out to be as simple as suggested there, it is expected to be completed by 2014.

The SAG report was based on the assumption that the In-depth Assessment for North Pacific sei whales would be conducted in 2010 as planned last year. This year, the Committee has concluded that in view of the relatively simple information available on the population, the In-depth Assessment and *pre-Implementation assessment* could most efficiently be combined into a single exercise, and **agrees** a compromise date of 2013 for the combined assessment, with RMP catch limits to be set the following year if no complications arise. The Committee **concurs** with the SAG that priority for the Committee should be to complete the RMP *Implementation* as soon as possible rather than to develop formal interim management advice. The Committee was unable to agree on the impact of the proposed catches on sei whales. The Committee **recommends** that as a minimum there should be no increase in the present level of catches until the RMP *Implementation* has been completed. Catches for North Pacific sei whales resumed in 2002 and the annual catch since 2004 has been 100 animals.

Table 9

Workshops and intersessional meetings planned for 2010/11.

Subject	Agenda item	Venue	Dates	Steering Group
North Pacific sighting survey workshop	Item 10.8.1; Annex G	Tokyo	28-30 September 2010	Q15
North Pacific 2011 cruise: planning	Item 10.8.2; Annex G	Tokyo	24-26 September 2010	Q15
Small cetaceans and climate change workshop	Item 12.5; Annex K	Vienna	28 November- 1 December 2010	Q24
Abundance of Antarctic minke whales workshop	Item 10.1.1; Annex G	Bergen?	January 2011	Q13
North Pacific minke whale preparatory meeting	Item 6.3; Annex D1	Tokyo	25-27 September 2010	Q4
North Pacific minke First Intersessional Workshop	Item 6.3; Annex D1	Korea	14-17 December 2010	Q4
Workshop on AWMP	Items 8.2; 8.3; Annex E	TBA	March 2011	Q1

Possible pre-meetings immediately before SC/63 depending on intersessional progress: AWMP gray whale *Implementation Review*; western North Pacific common minke whale *Implementation Review;* assessment of humpback whale Breeding Stock B.

21. RESEARCH AND WORKSHOP PROPOSALS AND RESULTS

Table 9 lists the proposed intersessional meetings and workshops. Financial implications and further details are dealt with under Item 24.

Results from last year's intersessional IWC workshops are dealt with under the relevant Agenda Items.

21.1 Review results from previously funded research proposals

Results from IWC funded projects are dealt with under the relevant agenda items.

21.2 Review proposals for 2010/11

No unsolicited research proposals were received. The Committee has **agreed** mechanisms for reviewing proposals under the SORP programme (Item 19) and the Small Cetaceans Voluntary Fund (Item 15).

22. COMMITTEE PRIORITIES AND INITIAL AGENDA FOR THE 2011 MEETING

Revised Management Procedure (RMP)
The following issues are high priority topics:

GENERAL MATTERS

(1) complete review of the range of MSYR values for use in the RMP;
(2) finalise approach for evaluating proposed amendments to the *CLA*;
(3) evaluate the Norwegian proposal for amending the *CLA*;
(4) consider implications that the phase-out rule in the RMP is applied by *Small Area* when catch cascading is applied and the abundance estimates are based on multi-year surveys; and
(5) modify the Norwegian 'CatchLimit' program to allow variance-covariance matrices to be specified for the abundance estimates.

IMPLEMENTATION REVIEW **FOR NORTH PACIFIC COMMON MINKE WHALE**

(1) review results of intersessional workshops; and
(2) complete the work assigned to the 'First Annual Meeting' in accord with our guidelines.

IMPLEMENTATION **FOR THE WESTERN NORTH PACIFIC BRYDE'S WHALES**

(1) review the research proposal for the 'variant with research'.

IMPLEMENTATION **FOR THE NORTH ATLANTIC FIN WHALES**

(1) review revised research proposal for the 'variant with research'; and
(2) review abundance estimates for use in the *CLA*.

IMPLEMENTATION **FOR THE NORTH ATLANTIC MINKE WHALES**

(1) review any new abundance estimates.

Aboriginal Whaling Management Procedure (AWMP)
The following issues are high priority topics:

(1) work on developing appropriate long-term management advice for the Greenlandic fisheries with the primary focus on:
   (a) completing work on a sex-ratio based assessment of common minke whales off west Greenland; and
   (b) progress on developing *SLA*s for West Greenland fin and common minke whales;
(3) the *Implementation Review* for the eastern North Pacific gray whales; and
(4) consider any new scientific information related to conversion factors for edible products for Greenland fisheries.

Bowhead, right and gray whales (BRG)
The following issues are high priority topics:

(1) perform the annual review of catch information and new scientific information for B-C-B stock of bowhead whales and prepare for the 2012 *Implementation Review*;
(2) review stock structure and abundance for Eastern Canada and West Greenland bowhead whales;
(3) review scientific information on North Pacific and North Atlantic right whales;
(4) review progress towards southern right whale workshop;
(5) review new information on western gray whales;
(6) review information on other stocks of bowhead whales; and
(7) review new information on eastern gray whales (not relevant to *Implementation Review*).

In-depth assessment (IA)
The following issues are high priority topics:

(1) resolve the reasons for the differences between estimates of abundance of Antarctic minke whales between the OK and SPLINTR models;
(2) continue development of the catch-at-age models of Antarctic minke whales, including sensitivity tests to examine various assumptions regarding ageing errors and age-length keys; and
(3) continue examination of the differences between minke abundance estimated from CPII and CPIII, by further investigation of the relationship between sea ice and minke whale abundance.

Bycatch and other human-induced mortality (BC)
The following issues are high priority topics:

(1) collaboration with FAO on collation of relevant fisheries data and joining FIRMS;
(2) review progress in including information in National Progress Reports;
(3) continue development of the international database of ship strike incidents;
(4) consider methods for estimating risk and rates of bycatch and entanglement;
(5) consider methods and data sources for establishing time series of bycatch;
(6) review methods to estimate mortality from ship strikes; and
(7) review methods for assessing mortality from acoustic sources and marine debris.

Stock definition (SD)
The following issues are high priority topics:

(1) furtherance of guidelines for genetic analyses;
(2) updates on guidelines for DNA Data Quality;
(3) statistical and genetic issues concerning stock definition;
(4) TOSSM; and
(5) unit-to-conserve.

DNA (DNA)
The following issues are high priority topics:

(1) review genetic methods for species, stock and individual identification;

(2) review of results of the 'amendments' work on sequences deposited in GenBank;
(3) collection and archiving of tissue samples from catches and bycatches; and
(4) reference databases and standard for diagnostic DNA registries.

Environmental concerns (E)
The following issues are high priority topics:

(1) SOCER;
(2) review progress on POLLUTION 2000+;
(3) review new information impact of oil and dispersants on cetaceans;
(4) review progress of the CERD Working Group;
(5) review progress on recommendations from 2010 focus sessions on masking sound;
(6) review approaches as available from other international forums with regard to mitigation of effects of anthropogenic sound on cetaceans;
(7) review progress on work from the 2nd Climate Change Workshop; and
(8) review of marine renewable energy development.

Ecosystem modelling (EM)
The following issues are high priority topics:

(1) review ecosystem models from the North Pacific that may be relevant to assessments and RMP *Implementations*;
(2) review other issues relevant to ecosystem modelling within the Committee; and
(3) review ecosystem modelling efforts undertaken outside the IWC.

Southern Hemisphere whales other than Antarctic minke whales (SH)
The following issues are high priority topics:

(1) humpback whales-complete the assessment of breeding stock B;
(2) blue whales (Antarctic and pygmy): population estimates and continue work on the Southern Hemisphere blue whale catalogue;
(3) prepare for assessment of humpback whale breeding stocks D, E and F;
(4) review new information on the Arabian humpback populations.

Small cetaceans (SM)
The following issues are high priority topics:

(1) the status of status of Ziphiidae (beaked and bottlenose whales) worldwide;
(2) directed takes of small cetaceans;
(3) review report from climate change-small cetaceans workshop;
(4) other topics e.g. marine bushmeat; and
(5) review of progress on previous recommendations.

Whalewatching (WW)
The following issues are high priority topics:

(1) assess the impacts of whalewatching on cetaceans;
(2) review reports from intersessional working groups:
 (a) large-scale whalewatching experiment (LaWE) Steering Group;
 (b) LaWE Budget Development Group;
 (c) on-line database for world-wide tracking of commercial whalewatching and associated data collection; and
 (d) swim-with-whale operations;
(3) consider information from platforms of opportunity of potential value to the Committee;
(4) review of whalewatching guidelines and regulations; and
(5) review of collision risks to cetaceans from whalewatching vessels.

Scientific Permits
The following issues are high-priority topics:

(1) Review of activities under existing permits.
(2) Review of new or continuing proposals.
(3) Procedures for reviewing scientific permit proposals.
(4) Planning for final review of results from Iceland's scientific take of North Atlantic common minke whales.

23. DATA PROCESSING AND COMPUTING NEEDS FOR 2010/11

The Committee identified and agreed the requests for intersessional work by the Secretariat given in Table 10.

Table 10
Computing tasks/needs for 2010/11.

RMP – preparations for *Implementation*
Run a full set of trials using the Norwegian 'CatchLimit' program for North Atlantic fin whales, Western North Pacific Bryde's whales; and North Atlantic minke whales and place the results on the IWC website (Item 5.3).

AWMP
Work in preparation for/arising from the proposed workshop (Item 21).

NPM
Update the control program for North Pacific minke whales and undertake any work arising from the Preparatory Meeting and the First Intersessional Workshop including assembling the catch data at the appropriate spatial and temporal resolutions and coding and conditioning the operating models themselves (Item 6.3.2).

In-depth assessment
Validation of the 2009/10 SOWER cruise data for incorporation into the DESS database; complete validation of the 1995-97 blue whale cruise data and incorporate into the DESS database; prepare a catch series for North Pacific sei whales (Item 10.9.1).

Southern Hemisphere whale stocks
Documentation of the catch data available for Antarctic minke whales in preparation for the *pre-Implementation assessment* (Item 20.4).

Bycatch
Input bycatch data from the last season (2009) and for previous seasons (from 2003 back) into the bycatch database (Item 7.1).

24. FUNDING REQUIREMENTS FOR 2010/11

Table 11 summarises the complete list of recommendations for funding made by the Committee. The total required to meet its preferred budget is £316,700. The Committee **recommends** all of these proposed expenditures to the Commission. This is slightly above the projected amount available for funding (£315,750). The Committee **agrees** that the final column given in the table represents a budget that will allow progress to be made by its sub-committees and Working Groups in its priority topics.

A summary of each of the items is given below, by sub-committee or standing Working Group. Full details can be found in the relevant Annexes as given in Table 11.

The Committee was pleased to note that procedures have been agreed to review proposals for funds from the Small Cetaceans Voluntary Fund and the Southern Ocean Research Partnership (Items 14 and 19). One proposal under the former has been recommended (see Item 14.6.1). The Committee was also pleased to note that funding has been found for the Workshop on Small Cetaceans and Climate Change (see Item 12.5).

Revised Management Procedure

(1) ANALYSIS AND USE OF TIME-SERIES OF DATA ON CALVING RATES AND INTERVALS FOR USE IN THE MSYR REVIEW

The Committee is conducting a review of the range of MSYR values to include in simulation trials when selecting among variants of the RMP. The third intersessional workshop on the review of MSYR assembled a number of datasets on calving rates and calving intervals for baleen whales. Efforts were made following the workshop to fit models which accounted for both process and observation error to the data on calving rates and calving intervals. However, numerical problems were encountered when implementing these models. Funding is required for researchers to overcome these problems to provide the inputs needed to apply the Bayesian hierarchical method adopted by the Committee for computing a posterior distribution for r_0.

North Pacific minke whales

(2) PREPARATORY MEETING AND FIRST INTERSESSIONAL WORKSHOP TOWARDS THE IMPLEMENTATION REVIEW FOR WESTERN NORTH PACIFIC COMMON MINKE WHALES

The schedule for an *Implementation Review* specifies that between the finalisation of the *pre-Implementation assessment* and the following annual meeting of the Scientific Committee, an intersessional workshop shall be held to address a number of issues. Given the complexity of this *Implementation Review*, it is important to hold a preparatory meeting before the First Intersessional Workshop.

Aboriginal Whaling Management Procedure

(3) WORKSHOP ON GREENLANDIC FISHERIES/PREPARATION FOR GRAY WHALE IMPLEMENTATION REVIEW

The Committee has a number of priority areas related to Greenlandic fisheries and an intersessional Workshop is required to address:

(1) progress on developing *SLAs* for West Greenland fin and common minke whales;
(2) progress on the development of the sex-ratio method; and
(3) preparation for the *Implementation Review* for eastern North Pacific gray whales.

(4) AWMP DEVELOPERS FUND

The developers fund has been invaluable in the work of *SLA* development and related essential tasks of the SWG. It has been agreed as a standing fund by the Commission. The primary development tasks facing the SWG are for the Greenlandic fisheries. These tasks are of high priority to the Committee and the Commission. The fund is essential to allow progress to be made.

Bowhead, right and gray whales

(5) SOUTHERN OCEAN RIGHT WHALE PHOTO-ID CATALOG

For several decades, extensive photo-id surveys have been carried out for southern right whales in the coastal waters of South America, southern Africa and Australia during winter and spring, and much valuable data on the demographics of these populations has been collected. Together with genetic information, these data also provide the opportunity to investigate interchange and mixing between the coastal populations. However, because of its geographic limitations it is uninformative about the links between these populations and those found (generally at higher latitudes) in summer where extensive catches were taken in pelagic whaling. Funding is requested to address this gap by compiling images of southern right whales taken away from coastal waters of the continents, in a catalogue and associated database.

In-depth assessments

(6) INVESTIGATE THE RELATIONSHIP BETWEEN SEA ICE CHARACTERISTICS AND ANTARCTIC MINKE WHALE ABUNDANCE ESTIMATES

No conclusions have yet been reached on the reasons for the appreciable decline in abundance estimates from CPII and CPIII. Changes in sea ice characteristics, such as its extent and configuration, have been considered as one of the most likely influential factors. In order to investigate this carefully, funding is required to enable the preparation of the following sea ice related data sets:

(1) timing of the ice melt index for the entire time series of CPII and CPIII; and
(2) sea ice characteristics (e.g. area of sea-ice-field) in the south of ice edge for the entire time series of CPII and CPIII.

(7) RESOLVING DIFFERENCES IN MINKE WHALE ABUNDANCE ESTIMATES

Over the past two years, two methods have been presented to estimate abundance from the CPII and CPIII IDCR/SOWER cruise data. However, there are large differences between the estimates. These differences are much greater than statistical uncertainty, and than generally seen in the simulated datasets. Following intersessional work by correspondence a workshop is required to attempt to finally resolve the difference between the two approaches.

(8) IMPORT 2009/10 SOWER DATA AND ASSIST ABUNDANCE WORKING GROUP

Funds are required to enable the 2009/10 IWC/SOWER data to be incorporated into DESS and to provide general support to the IWC Secretariat regarding DESS. Errors will be corrected in the 'standard' and IDCR/SOWER datasets before the 2010 Scientific Committee meeting.

(9) AND (10) 2011 NORTH PACIFIC SIGHTING CRUISE AND ASSOCIATED MEETINGS

A new medium- to long-term research programme involving sighting surveys to provide annual information for cetacean stock management in the North Pacific is scheduled to commence in 2011. The cruise will last a total of about 60 days between July and August and the vessel *Kaiko Maru* will generously be provided by the Japanese Government. A two-day planning meeting for the 2011 cruise will be held in Tokyo. It will be preceded by a three-day workshop to develop the medium to long term objectives of the research programme and associated fieldwork.

(11) STATISTICAL CATCH-AT-AGE ESTIMATORS FOR ANTARCTIC MINKE WHALES

The Committee is trying to understand the reasons for the apparent large declines in abundance indicated by estimates produced from these surveys. Several of these reasons can be explored by population dynamics modelling. In 2005, Punt and Polacheck developed the statistical catch-at-age (SCAA) model, which has been refined over the last few years and is considered the most appropriate modelling framework for addressing these issues. Funding is requested for Committee's researchers to implement the recommendations so that in 2011 it will be in a position to apply the SCAA model to the most recent datasets.

Other Southern Hemisphere whale stocks

(12) SOUTHERN HEMISPHERE BLUE WHALE CATALOGUE PROJECT

Little is known about the present-day migration of blue whales, population structure and abundance or the level of interchange among populations. In 2008, the IWC supported the creation of a Southern Hemisphere blue whale catalogue and Centro de Conservacion Cetacea in Chile was tasked with developing a central web-based system by which Southern Hemisphere blue whale photo-id matching could take place. Matching will be conducted during the next two years through this platform by researchers from three Southern Hemisphere regions. Comparisons of blue whale photo-id and the significant number of individuals catalogued will be time consuming and researchers will not have enough free time to dedicate to the matching process. Therefore funding is required to ensure the matching process is completed. This will be a two-year project and a further request for funding (£11,200) will be submitted next year.

(13) MODELLING OF SOUTHERN HEMISPHERE HUMPBACK WHALE POPULATIONS

(1) Deliberations at the 2010 Annual Meeting have led to a number of proposed variants of stock-structure models for breeding stock B. Computer software needs to be developed to implement these models to take account of tag-recapture data.
(2) Simultaneous analysis of all 7 breeding stocks using the current age-aggregated model is desirable so that:
    (a) the catch allocation uncertainty is taken into account in a consistent and even-handed manner;
    (b) uncertainties in the boundaries for such allocations can be properly included in the analysis; and
    (c) likely similarities in intrinsic growth rate parameters for the different stocks can be properly factored into the analyses.

Development of this model has commenced but still needs further development. A contribution towards the salaries of researchers is requested to enable progress to be made with (1) and (2).

(14) ANTARCTIC HUMPBACK WHALE CATALOGUE

The Committee is already committed to funding this project, which represents only a partial cost of running the catalogue and is of great benefit to its in-depth assessment of Southern Hemisphere humpback whales. The funds are required to continue the cataloguing of submitted photographs and further develop and enhance the system for on-line access. The work will be carried out by Carlson and Allen.

Bycatch and other human-induced mortality

(15) FURTHER DEVELOPMENT AND MAINTENANCE OF THE IWC SHIP STRIKE DATABASE

Development of the IWC ship strike database has continued intersessionally. Funding is required for: (1) completing work on public summaries; (2) the development of a handbook; (3) data entry and validation; and (4) annual ongoing work by the data review group. The need for a global database of incidents involving collisions between vessels and whales has previously been recognised by the Committee, as well as other bodies such as the International Maritime Organization (IMO) and ACCOBAMS.

(16) DEVELOPMENT OF AN ONLINE SUBMISSION DATABASE FOR PROGRESS REPORTS

In 2009 the possibility of developing an online form/ database for submission of national Progress Reports was discussed as part of work on bycatches and small cetaceans, in addition to the general work of the Committee. Due to time constraints it was not possible to progress this further. A small group met this year to design an initial template and the Committee is now in the position to start trialling such a database. Funding is required for an expert to work with the IWC Secretariat to create this database and an initial version will be available at the next Annual Meeting.

Environment

(17) RISK ASSESSMENT MODELING TO DETERMINE THE IMPACT OF POLLUTANTS ON CETACEAN POPULATIONS

The report of the Phase II Intersessional IWC Pollution 2000+ Workshop (SC/62/Rep4) recommends that a number of modelling exercises be undertaken. This will involve the development and implementation of two demonstration projects, using the risk assessment framework (based on an individual based model approach). Funding is required to employ a post-doctoral research assistant to conduct this work under the direct supervision of Schwacke and Hall, with input and guidance from the Pollution 2000+ Steering Committee. This will be a two-year project and a further request for funding (£70,750) will be submitted next year.

(18) STATE OF THE CETACEAN ENVIRONMENT REPORT (SOCER)

The Committee regards SOCER to be a useful document that provides a 'snapshot' of environmental developments relevant to cetaceans that was requested by the Commission. Money is requested to support the production of this report.

Whalewatching

(19) DATA COMPILATION AND POWER ANALYSES FOR THE LAWE

The LaWE initiative aims to understand the possible effects of whalewatching on the demographic parameters of cetacean populations. In order to develop procedural mechanisms to centralise relevant data and to commence power analysis for key parameters, funding is required to employ a research assistant for 6 weeks.

Other

(20) INVITED PARTICIPANTS (IPs) FUND

The Committee **draws attention** to the essential contribution made to its work by the funded IPs. The IWC-funded IPs play an essential role in the Committee's work, including the critically important roles of Chairs and rapporteurs. They represent excellent value as they receive only travel and subsistence costs and thus donate their time, which is considerable. As was the case for previous meetings, where possible, effort will be made to accommodate scientists from developing countries.

25. WORKING METHODS OF THE COMMITTEE

25.1 Citation of Scientific Committee documents

SC/62/SCP1 was produced in response to the discussion last year about the Committee's policy with respect to the citation of Scientific Committee documents (IWC, 2010c, p.92). At that time the Committee had noted that *inter alia* its policy must ensure transparency with respect to advice provided by the Committee and to respect the rights of scientists to first publication of data.

The authors of SC/62/SCP1 had examined both the policy of the *Journal* and that of the Committee with respect to the question of including 'Not to be cited (or used) without the permission of the author(s)' at the top of a paper. They noted that there was some ambiguity in the present rules that required clarification and suggested that the ability to include a 'not to be cited....' restriction to a paper should be removed and replaced by a 'please inform authors when citing outside an IWC meeting' header.

There was considerable discussion of this proposal. The Committee, as before was concerned to:

(1) ensure transparency;
(2) respect rights to first publication; and
(3) avoid the possibility that authors may refuse to submit papers of value to the Committee's work.

Recognising the sensitivities involved and the need to find an appropriate balance amongst items (1)-(3) above, the Committee **agrees** that in future, all papers presented to the Scientific Committee contain the following header (this information will also be included in the Scientific Committee Handbook and when providing information on document submission to meetings and workshops):

> 'Papers submitted to the IWC Scientific Committee are produced to advance discussions within that Committee: they may be preliminary or exploratory. It is important that if you wish to cite this paper outside the context of an IWC meeting, you notify the author at least six weeks before it is cited to ensure that it has not been superseded or found to contain errors.'

The Scientific Committee List of Documents attempts to keep track of papers that have been presented to Scientific Committee meetings and can be found on the IWC website[7]. Authors who are aware of particular problems with any of their past papers are invited to inform the Secretariat who will keep an updated compilation.

25.2 Working papers, late papers and related issues

As a result of discussions during the meeting, the Committee **agrees** on the need to clarify certain issues with respect to working papers and primary papers that arrive late. The definitions and rules regarding these (and other categories of paper including 'For Info' papers) can be found in the Scientific Committee Handbook[8].

Primary papers must be submitted by the end of the first day of the Annual Meeting. Considerable flexibility has been shown by the Chair and Head of Science in the way they have dealt with papers for which a title has been submitted but which for one reason or another, arrive late. Formally, they can be called working papers because they have missed the deadline and then immediately be 'upgraded' to primary papers to minimise copying. Unfortunately, this flexibility is tending to be abused as a larger number of papers are being submitted past the deadline. For this reason, the Committee **agrees** that in future only in exceptional circumstances will late papers be accepted. In addition, Chairs will be very strict on the criteria for accepting working papers i.e. they must arise from discussions and be requested and/or be likely to expedite resolution of disagreements or stimulate debate within the meeting.

Notwithstanding the question of late papers, the Committee **agrees** that there may be circumstances in the future where it is appropriate for certain working papers to be 'elevated' to the status of a primary paper during the meeting. The Chair and Head of Science will apply the following two criteria:

[7] *http://www.iwcoffice.org/publications/pubmain.htm.*
[8] *http://www.iwcoffice.org/sci_com/handbook.htm.*

(1) the working paper has been presented and discussed within a sub-group or the plenary, such that an opportunity to comment on it has been given; and
(2) the text of the sub-group or plenary report would be significantly improved, streamlined or clarified by the ability to reference the paper as a primary document.

26. ELECTION OF OFFICERS

The Committee **agrees** that there was no need for elections this year.

27. PUBLICATIONS

Donovan reported on issues relating to the production of the *Journal*. Unfortunately, the year has been plagued by a series of problems with respect to getting the *Journal* published, due to internal problems at the printers that the IWC has used for many years. Sadly, after attempts to secure further investment, they are no longer trading but the Secretariat had very little notice in terms of finding an alternative. We have managed to find another company that we are using on a trial basis, and thanks to the page-setting abilities of Andrea Cooke, we managed to at least get the large *Supplement* out on time. We are now dealing with a different company and the *Journal* and Supplements should once again appear promptly. That being said, the Secretariat is in the process of examining a number of companies for ability and price. It is expected that the resultant backlog of papers will be reduced or eliminated in the coming year. In addition, the possibility of including electronic subscriptions is being investigated. The most efficient and cost effective way to digitise earlier reports is also being investigated. The Committee, as in previous years, **reiterates** the importance of the *Journal* to its work and encourages members to urge their institutes to subscribe.

28. OTHER BUSINESS

This is the final meeting for Nicky Grandy, Secretary of the Commission. The Scientific Committee rose in appreciation of her dedicated work in organising its meetings over the last decade. It noted the calm, efficient, good humoured way that she (and the team she ran) had assisted the Scientific Committee, even in the face of its sometimes unreasonable demands. On behalf of the Committee, its elder statesman, John Bannister, presented her with a specially painted card and a beautiful Moroccan rug, wishing her the very best for the future – she will be greatly missed.

29. ADOPTION OF REPORT

In closing the meeting, Palka thanked the Secretariat for carrying out its work in the usual efficient manner. The report was adopted at 17:20 on 11 June 2010. As is usual, final editing was carried out by the Convenors after the meeting.

Annex E

Report of the Standing Working Group on the Aboriginal Whaling Management Procedure (AWMP)

Members: Donovan (Convenor), Acquarone, Allison, Baker, Bickham, Borodin, Brandão, Brandon, Breiwick, Broker, Brownell, Butterworth, Childerhouse, Cipriano, Dupont, Fadeev, Givens, Gunnlaugsson, Heide-Jørgensen, Hiruma, Ilyashenko, Iñíguez, Jaramillo, Johnston, Kanda, Kitakado, Lang, Lockyer, Mate, Moore, J., Nukulina, Palka, Punt, Reeves, Roel, Rose, Schweder, Scordino, Suydam, Swindoll, Thomas, Tyurneva, Uoya, Walløe, Weller, Witting.

1. INTRODUCTORY ITEMS

1.1 Convenor's opening remarks
Donovan welcomed the participants to the meeting. He noted that given the logistics of the intersessional workshop, it had not been possible to dedicate sufficient time to consideration of Greenlandic issues related to future *SLA* development (SC/63/Rep2). Given that the focus of the pre-meeting was to provide time for that discussion to begin, he noted that that the relevant agenda Items 2 and 3 would be completed during the normal Standing Working Group (SWG) sessions.

1.2 Election of Chair
Donovan was elected Chair.

1.3 Appointment of rapporteurs
Givens and Punt acted as rapporteurs, with assistance from the Chair.

1.4 Adoption of Agenda
The adopted agenda is given in Appendix 1.

1.5 Documents available
The new primary documents available to the SWG were SC/63/AWMP1-5 and SC/63/Rep2.

2. CONCLUSIONS ON THE SEX RATIO METHOD

Witting (2005; 2006) proposed that the abundance of West Greenland minke whales could be estimated using time series data on the sex ratio of past catches. Since then, the proposed method and subsequent improvements to estimate only the lower confidence bound on the abundance (starting with Witting and Schweder, 2007) have been evaluated by the SWG to determine if they could provide reliable, accurate, and precise estimates at Annual Meetings and Workshops. Last year, the SWG agreed that despite considerable effort, it was still not possible to confirm whether a sex-ratio-based method was appropriate and effective. It agreed that it would no longer prioritise development of this technique unless a comprehensive final analysis could be endorsed at the 2011 Annual Meeting.

In response to the problems seen in the sex ratio method, SC/63/AWMP5 described a possible remedy involving transformation of a key parameter in the model. An illustrative example used a transformation which operates in a way that for population sizes much greater than are realistic, the impact of catches of females on abundance is damped. This leads to finite estimates of carrying capacity *K* even in circumstances where the trend over time in the proportion of whales in the catch that is male is decreasing (as is the case for West Greenland minke whales). The example was shown to produce positively biased estimates of the lower 5% confidence interval for current population size. However the degree to which this bias warrants concern is difficult to assess since the estimator is positively biased even in circumstances where the proportion of the catches that are male does not trend downwards over time.

The SWG thanked the authors of SC/63/AWMP5 for their efforts to resolve the problems. Although SWG members offered the authors a variety of technical suggestions and comments on the method, it was clear that exploratory work in SC/63/AWMP5 was not the comprehensive final analysis sought by the SWG. The most obvious limitation of the method was that estimation of abundances appeared to be strongly positively biased. This is problematic in relation to abundance estimation, but it was noted that the approach in SC/63/AWMP5 might still prove useful in a future *SLA* if, for example, the bias was corrected for, or the *SLA* was tuned to adapt suitably to the bias.

The SWG thanked Witting, Schweder, Brandão and Butterworth for their considerable effort over the last several years in developing a novel and scientifically interesting estimation approach for sex ratio data. Despite their outstanding contributions to the work of the SWG, no final solution had yet been developed to remedy the previously expressed concerns. The SWG also noted that the original motivation for the work, the need to obtain a satisfactory abundance estimate has been superseded by the aerial survey (Heide-Jørgensen *et al.*, 2010) that had resulted in an agreed abundance estimate (16,600; 95% CI:7,170-38,500) that was suitable for assessment. Discussion of how to proceed with the development of an operating model to evaluate candidate *SLA*s for this stock is provided under Item 3.2.

3. CONSIDERATION OF WORK REQUIRED TO DEVELOP *SLA*S FOR ALL GREENLANDIC HUNTS BEFORE THE END OF THE INTERIM PERIOD

In Greenland, a multispecies hunt occurs and the expressed 'need' is for 670 tonnes of edible products from large whales for West Greenland; this involves catches of common minke, fin, humpback and bowhead whales. The flexibility among species is important to the hunters and satisfying 'subsistence need' to the extent possible is a critical component of management. Last year, the SWG noted that the development of a combined approach to calculate strike limits for more than one species has not been previously attempted (IWC, 2011b).

The SWG **endorsed** the views of the intersessional Workshop that this matter should be deferred until single-species management approaches had been developed further. These would provide the necessary basis to extend to multi-species considerations, such as need being expressed on a species-combined rather than a species-specific basis.

For a number of reasons, primarily related to stock structure issues, the SWG noted that development of *SLA*s for Greenland aboriginal hunts (especially for common minke and fin whales) will be more complex that any *Implementation* the SWG had previously considered. The Committee endorsed an interim safe approach to setting catch limits for the Greenland hunts in 2008 (IWC, 2009b), noting that this should be considered valid for two five-year blocks i.e. the SWG target will be for agreed and validated *SLA*s, at least by species, for the 2017 Annual Meeting (assuming that the Commission sets 5-year block quotas in 2012 as scheduled). Given the complexity of the development process, this work is high priority and the SWG **emphasised** that it will be necessary to hold intersessional workshops (see Item 10) to expedite progress.

3.1 and 3.2 Fin whales and common minke whales

At its 2011 intersessional workshop, the SWG noted that the first step toward *SLA* development for West Greenland fin whales and common minke whales will be to define the operating model(s) that are to be used to test the performance of candidate *SLA*s.

The SWG noted that both of these species have been the focus of RMP *Implementations* and *Implementation Reviews*, even though the focus has not been on Greenland. It is clearly essential that the operating models used to develop *SLA*s for the Greenland hunts are based on those used in the RMP *Implementations.* These should be based on the existing *Implementation Simulation Trial* framework for the North Atlantic common minke (IWC, 1994; 2005, p.18; 2009a, p.11) and fin whales (IWC, 2010). Given the SWG's focus on Greenland, it is clear that the review of the RMP operating models and specifications will probably identify refinements and modifications to the existing trials structure to properly account for the West Greenland case, particularly with respect to stock structure; it is important that ultimately these discussions are held in collaboration with the sub-committee on the RMP to ensure consistency with operating models to the extent possible. In addition, the *SLA* development process will have to take into account catches made under the RMP.

As part of the conceptual discussions held within the SWG, Witting and Heide-Jørgensen produced some initial ideas on the better integration of the West Greenland situation with the existing RMP operating models. They agreed to develop these ideas further and present a paper to the proposed intersessional meeting.

3.3 Humpback whales

The Scientific Committee has previously agreed to provide management advice on the West Greenland feeding aggregation of humpback whales by treating this as an independent stock (IWC, 2008, p.21). The SWG welcomed new work presented this year on the development of a stock assessment model for these whales (SC/63/AWMP2).

SC/63/AWMP2 used recent abundance estimates, historical catches starting from 1664, and an age- and sex-structured population model to perform Bayesian assessments of West Greenland humpback whales. The historical catches included the West Greenland catches as a lower bound on the catch history, and the West Greenland plus 10% of the West Indies catches as an upper bound. Prior distributions for life history parameters had been constructed from studies on humpback whales in the North Atlantic to account for the uncertainty associated with the parameters. The abundance data included a fully-corrected West Greenland humpback abundance estimate of 3,270 (CV: 0.50) individuals in 2007 (Heide-Jørgensen *et al.*, 2008), a time-series of relative abundance estimates from aerial surveys (Heide-Jørgensen *et al.*, 2008), and a time-series of relative abundance estimates from mark-recapture analysis (Larsen and Hammond, 2004).

SC/63/AWMP2 examined whether the long-term dynamics (from 1664) is best described by density-regulated growth, with perturbed populations returning monotonically towards an equilibrium state, or by inertia dynamics, where populations typically return through damped cycles. There was substantial statistical support for inertia dynamics and rejection of density-regulated growth. It was estimated that the abundance declined from a population dynamic equilibrium of 2,900 (90% CI:1,800-5,900) individuals in 1664 to a minimum of 1,300 (90% CI:230-5,100) individuals in 1927. The depletion ratio for 2011 was estimated to be 1.4 (90% CI:0.68-3.1), and the model projected that the population will increase to 5,200 (90% CI:2,400-9,000) individuals in 2020 (assuming yearly post-2010 catches of 10).

The SWG noted that a key element of SC/63/AWMP2 was the comparison of three alternative dynamics models: exponential growth (E), density-regulated (D), and inertia dynamics (I). Model E fitted the available abundance data well, but was not appropriate to use without modification over time spans longer than a few decades because it included no regulation of abundance or density feedback mechanism. Model D explicitly included density regulation, but did not fit the data well over the long time period that started in 1664. However, it could be made to fit the abundance and catch data over a shorter period of time. In other applications (e.g., for eastern North Pacific gray whales), model misfit over similarly long time periods has been addressed by starting the model recently and estimating its status relative to carrying capacity at that time. Such an approach may be applicable to the West Greenland humpback case, too. Additional calculations during the meeting applied a density-regulated model over a short time-period starting in 1980, and this fitted the data as well as the exponential model. In this case, however, the data were not informative about an upper bound for the carrying capacity.

Model I led to a good fit to the abundance data when the model was started in 1664, but may be questionable for use as operating model because the inertia dynamics over long time periods will be quite sensitive to parameterisation. This sensitivity could also render the parameterisation of future projections (i.e., as an operating model to test *SLA*s) difficult.

SWG members offered several comments on these assessment methods. It was suggested that the prior distributions for the bias parameters should be changed to be uniform on a log scale because this would mean that the relative abundance indices would not provide information on absolute abundance. It was noted that only one of the abundance estimates used in the analysis was an estimate of absolute abundance, so the fitted abundance curve should pass right through that point. This result was not seen, but

Table 1

Most recent abundance estimates for minke whales in the Central North Atlantic.

Small Area(s)	Year(s)	Abundance and CV
CM	2005	26,739 (CV=0.39)
CIC	2007	10,680 (CV=0.29)
CG	2007	1,048 (CV=0.60)
CIP	2007	1,350 (CV=0.38)

calculations during the meeting using log uniform priors on the abundance parameters and the bias in the relative surveys did achieve this result.

It was noted that models E, D, and I used 7, 8, and 9 parameters, respectively, to fit 9 data points. One member expressed concern about the very low number of degrees of freedom in these models because: (i) posterior distributions for some of the parameters (survival and birth rates, and age of sexual maturity) could be misleading (see below); and (ii) in an over-parameterised model, nearly any predicted outcome can be achieved from a variety of parameter combinations. The SWG noted that when dynamics models are sex- and age-structured, it is common to find that the data provide information about only a few parameters (e.g. carrying capacity and MSYR or the inertia parameter) while the posterior distributions for the remaining parameters differ little from the priors because the abundance data do not provide much signal for these parameters. This was found in SC/63/AWMP2. In the present application, the data were also informative about the parameters specifying bias in the relative abundance estimates. For parameters about which the abundance data contain little information, incorporating prior distributions (as done in SC/63/AWMP2) can be interpreted as a strategy to incorporate additional uncertainty into the results. The priors on the life history parameters of SC/63/AWMP2 were based on studies of humpback whales in other areas of the North Atlantic than West Greenland.

Over-fitting can sometimes be identified using the correlation and strength of nonlinear relationships among posterior parameter estimates. A supplement to SC/63/AWMP2 listed the parameter correlation matrix for each model. Correlations ranged from zero to strong (~0.90), yet it is important to realise that correlations among parameter estimates can also reflect the underlying constraints established by the structure of the dynamics model. The SWG **agreed** to carefully monitor for signs of problems associated with over-fitting when it conditions operating models for *SLA* development and testing.

In conclusion, the SWG recognised that the development process of an *SLA* for Greenland humpback whales would focus on consideration of the West Greenland feeding aggregation as a management unit. This may allow less attention on the overall North Atlantic humpback whale stock structure and may also avoid attempting to incorporate the long time series of catch data and the attendant catch allocation problems noted during the comprehensive assessment (e.g. IWC, 2002b; 2003).

3.4 Bowhead whales

Discussion within the Committee in recent years has focussed on stock structure and associated abundance estimates. The present working hypothesis is that bowhead whales in eastern Canada-West Greenland comprise a single stock; the alternative hypothesis is one of two stocks: one in Hudson Bay-Foxe Basin and another in Baffin Bay - Davis Strait.

SC/63/AWMP3 used recent abundance estimates, historical catches starting from 1719, and an age- and sex-structured population model to conduct Bayesian assessments of bowhead whales in eastern Canada-West Greenland. It also included a model for a Baffin Bay-Davis Strait stock, given the alternative two stock hypothesis. The historical catches were based on Higdon (2010), with a lower bound on the catch histories being given by the high and medium quality catch data, and an upper bound being given by all available data. An agreed abundance estimate of 6,340 (CV: 0.38) for 2002 (IWC, 2009b) was available to represent either the abundance of the entire eastern Canada-West Greenland population, or the Baffin Bay-Davis Strait stock. A time series of five estimated sighting rates covering the range from 1981 to 1998 for the Disko Bay area (Heide-Jørgensen *et al.*, 2007) was also used when fitting the model.

SC/63/AWMP3 examined whether the long-term dynamics (from 1719) are best described by density-regulated growth or by inertia dynamics. For eastern Canada-West Greenland bowhead whales there was substantial statistical support for inertia dynamics and for rejection of density-regulated growth. It was estimated that abundance declined from a population dynamic equilibrium of 30,000 (90% CI:24,000-35,000) individuals in 1719 to a maximal depletion of 1,700 (90% CI:510-4,900) individuals in 1888. The depletion ratio in 2011 was estimated to 0.29 (90% CI:0.15-0.58), and the population was projected to increase to 10,000 (90% CI:5,200-20,000) individuals in 2020 (assuming yearly post-2010 catches of 5). For the Baffin Bay-Davis Strait stock under the two stock hypothesis, it was estimated that abundance declined from a population dynamic equilibrium with 34,000 (90% CI:23,000-40,000) individuals in 1719 to a maximal depletion of 3,400 (90% CI:590-8,500) individuals in 1888. The depletion ratio in 2011 was estimated to 0.25 (90% CI:0.13-0.52), and the population was projected to increase to 9,100 (90% CI:4,500-18,000) individuals in 2020 (assuming yearly post 2010 catches of 3).

In discussion, it was noted that this approach was very similar to the method used for humpback whales discussed under Item 3.3. However, in the bowhead case, limitations of the available data presented greater problems and raised concern for SWG members.

Most importantly, the SWG noted that 5 of the 6 abundance estimates used as data were rough indices of relative abundance (as opposed to absolute abundance) pertaining to a small area and hence may be questionable as indices of total abundance. These estimates were based on a total of only 11 sightings from aerial surveys of the spring aggregation of bowhead whales in the Disko Bay area. Data on body length suggest that it is primarily large and mature bowhead whales without calves that occur in the Disko Bay area (Heide-Jørgensen *et al.*, 2010), and it may be expected that the time series of sighting rates relate to a local age/sex aggregation. It was further noted that problems with over-parameterisation were more likely here than for West Greenland humpbacks. For these reasons, the SWG was sceptical that the available index data could be used to fit a dynamics model reliably.

It was noted that the posterior distribution for adult mortality appeared to be bounded above by approximately 1%, whereas analysis of the Bering-Chukchi-Beaufort Seas bowhead populations had supported values half as large and even smaller. The analysis did not include an explicit prior on adult mortality. Instead, values for adult mortality were calculated from sampled values from the priors on the other life history parameters and the prior on the population growth rate. Thus, it was not clear whether this result was an artefact of the prior distributions for the other parameters or driven by the data (through the likelihood function). If desired, the assessment could place a prior on the adult mortality rate rather than the growth rate, with the growth rate being calculated from the values of the other parameters. The SWG did not consider whether it was most desirable to control the growth rate or adult mortality using an explicit prior.

The analysis in SC/63/AWMP3 assumed a prior for the growth rate parameter that supported only positive values. However, Witting reported that negative values would have received some posterior probability had they been given some prior probability. During the meeting, a version of the analysis that fitted the mature component of the population to the sighting data from Disko Bay using a uniform prior from -0.07 to 0.07 on the growth rate of the exponential model was presented. The posterior estimate (3.8%, 90% CI: -2.7% - 6.1%) was less accurate, but with a point estimate rather similar to the estimate from the Bering-Chukchi-Beaufort Seas population of bowhead whales (3.4%, 95% CI: 1.7%-5%) (Zeh and Punt, 2005).

The SWG recalled that a primary purpose for this bowhead assessment is the development of an *SLA*. In this context, a high degree of precision appears unnecessary. The agreed abundance estimate for 2002 is 6,340 - CV: 0.38 (IWC, 2009b), yet the need envelope is probably likely to be around five strikes per year, to which probably less than five additional removals would be added to reflect takes by native communities in Canada, at least on present information (see Annex F). Compared to the abundance estimate, this level of removals would seem to have only limited impact. The SWG noted that it might be therefore possible to establish a simple *SLA* because these circumstances suggested that the need to develop a more sophisticated approach appeared to be a low priority. Furthermore, a simple method would still be subject to an *Implementation Review* if the approach appeared inadequate or if the need envelope or level of Canadian takes increased. Development of a simple method would require the determination of a need envelope, and the Chair of the SWG was asked to discuss need envelopes with the hunters.

4. IMPLEMENTATION REVIEW OF GRAY WHALES WITH EMPHASIS ON THE PCFG

At the 2010 Annual Meeting (IWC, 2011a), it had been agreed that the information on stock structure and hunting presented, although some of it had not met the Data Availability Guideline requirements (IWC, 2004) for the 2010 review, warranted the development of trials as part of a new *Implementation Review* in 2011 to evaluate the performance of *SLA*s for hunting in the Pacific Northwest, with a primary focus on the PCFG (Pacific Coast Feeding Group). It also agreed that the 2010 *Implementation Review* had shown that the population as a whole was in a healthy state, but that over the next few years, further work should be undertaken to investigate the possibility of structure on the northern feeding grounds, especially in the region of the Chukotkan hunts.

4.1 Summary of intersessional Workshop

Donovan summarised the report of the intersessional Workshop held in La Jolla, California from 28 March-1 April 2011. With respect to gray whales, the focus of the workshop was preparing to complete an *Implementation Review* of eastern gray whales at the 2011 Annual Meeting, with the focus on the proposed Makah hunt and the PCFG. Most of the effort centred on reviewing the available information in the context of developing an operating model and trial structure such that conditioning and trial runs could be completed before and at the Annual Meeting.

The SWG received new and updated information on stock structure and movements (including information, some preliminary, on movements of gray whales between the western and eastern North Pacific), abundance and trends (including estimates for the PCFG and for the 'total'), catch data (including bycatches) and feeding ecology.

The Workshop agreed that the trials would consider three geographic regions. The north area is north of 52°N (roughly northern Vancouver Island), the PCFG area is between 41°N and 52°N, and the 'south' area is south of 41°N. The trials will consider two stocks ('PCFG' and 'north'). Some PCFG whales will be found outside of the PCFG area at various times during the year. However, this is not problematic since the historical catches north of 52°N occurred well north of 52°N and future catches will either occur in the Bering Sea or in the Makah U&A[1].

The discussions of trial structure were greatly aided by the presentation of Punt (2011) in which an age- and sex- structured operating model was presented that could form the basis of operating models for the *Implementation Review.* The *SLA* to be considered was provided by the Makah Tribal Council (details are presented in SC/63/Rep2, Annex D). Its implementation in the operating model is included in Appendix 3 to this report as part of the overall trial specifications, as are details of catches, bycatches, abundance, biological parameters including MSYR and performance statistics, including updates from the present meeting.

Unlike previous *Implementations*, the PCFG was for a 'small' population (previously referred to as a 'Type 3 Fishery'). Based on the work of Punt and Breiwick (2002), it was agreed that demographic uncertainty would be largely inconsequential even for a population of 200. However, it also agreed: (1) that the lowest number of mature females during the 100-year projection period should be included in the standard set of summary statistics so that an evaluation of the potential for depensation could be made; and (2) the set of trials will include cases in which there is environmental variability in the form of mortality events.

The Workshop agreed to the following specifications for the base-case trials:

(1) Two stocks (PCFG, non-PCFG).
(2) Four spatio-temporal strata (south, north, PCFG [Dec.-May], CPFG [Jun.-Nov.]).
(3) Split of catch to stock:
  (a) south: 1% PCFG; 99% non-PCFG;
  (b) PCFG [Dec.-May]: 20.3% PCFG; 79.7% non-PCFG;
  (c) PCFG [Jun.-Nov.]; 100% PCFG; and
  (d) north: 0% PCFG.
(4) The split of the catch to stock is deterministic in the past, but stochastic in the future.
(5) The probability of a PCFG whale being classified as non-PCFG is 0.
(6) The probability of a north whale being classified as PCFG is 0.01.
(7) 50% of struck animals are lost.
(8) Selectivity is to be 1+.
(9) All catches occur prior to May[2].
(10) $MSYL_{1+} = 0.6$; $MSYR_{1+}=4.5\%$.

[1]'Usual and accustomed fishing grounds' – Although these include the Strait of Juan de Fuca the hunt will be prohibited there due to the large portion of PCFG whales photographed in that area. The hunt will be limited to 1 December - 30 May to minimise the likelihood of PCFG whales.
[2]This assumption is conservative because it will lead to the highest assessed risk to the PCFG stock. In principle, it would be desirable to model to relative probability of strikes by month but no data are available to make any estimates. Sensitivity is explored to the assumption that all of the catches occur in April.

From this, the Workshop developed an initial set of *Evaluation* and *Robustness Trials* (SC/63/Rep2, tables 4 and 5) and reviewed and modified the performance statistics from the 2004 *Implementation.* The revised set of statistics can be found in Appendix 3 to this report.

A number of intersessional tasks were set and progress with these is discussed under Item 4.3.

4.2 Review of information on the PCFG

SC/63/AWMP1 presented a review of published and gray literature on PCFG gray whales. The objective of the paper was to familiarise the AWMP SWG with the biology of the PCFG whales and to draw attention to important components of the PCFG as it relates to management.

The first issue for management consideration is the range of the PCFG. The IWC currently defines PCFG whales as gray whales observed in multiple years between 1 June and 30 November between 41°N and 52°N (IWC, 2011b). This definition is based on research that does not uniformly survey the potential range of PCFG gray whales; the northern and southern extents of the range are poorly sampled. Gosho *et al.* (2011) found that 17.5% of gray whales photographed during surveys at Kodiak Island, Alaska matched to whales in the Cascadia Research Collective catalogue of whales in the PCFG area. If Kodiak Island were included in the PCFG range then the population estimate for the PCFG would be biased low by 100-200 whales.

The second issue for management consideration is immigration. Recently Frasier *et al.* (2011) and Lang *et al*. (2011) have found small but significant differences in mitochondrial DNA haplotype frequencies between PCFG whales and samples thought to be representative of the overall Eastern North Pacific (ENP) population and high genetic diversity in both PCFG and ENP whales. Lang *et al*. (2011) suggested that the high observed genetic diversity and low level mtDNA differentiation is consistent with the PCFG either being a recently founded group or a group exhibiting filopatry recruitment with low level recruitment. Photo-id surveys show recruitment into the PCFG at rates thought to be greater than the potential calf production of the PCFG (Calambokidis *et al.*, 2010; IWC, 2011b).

The newest time series of abundance estimates for PCFG whales indicates that there was an average recruitment of 25.8 whales into the PCFG between 1999 and 2002, coinciding with the observed mortality event of ENP whales (IWC, 2011b). Ethnographic records presented by Scordino suggest that gray whales have been hunted off the coast of Washington during the 1 June-30 November timeframe since at least the 1850s. Stable isotope findings are less conclusive, but may show that the PCFG has existed for the past 1,500 years in which Makah whaling has been documented. Together, these results strongly suggest that some level of immigration is occurring to the PCFG. As a result, when setting up *Implementation Trials*, some degree of immigration from the ENP must be considered and there should be recognition of potential negative bias to population estimates of the PCFG.

Scordino also provided an overview of the Makah Tribe's proposed hunt (SC/63/Rep2, Annex D). The SWG noted that unlike the *SLA*s for the BCB bowhead and the ENP gray whales, the *SLA*s to be evaluated for the hunt in the Makah U&A were not developed by the SWG, but are rather based on the proposed hunt and variants thereof developed by the Makah Tribe.

4.3 Progress with intersessional tasks

4.3.1 Finalise the specifications for the trials

4.3.1.1 PROVIDE UPDATED ABUNDANCE ESTIMATES AND THE ASSOCIATED VARIANCE-COVARIANCE MATRIX

Jeff Laake provided the updated abundance estimates for inclusion in the trials (see SC/63/Rep2, Annex H). The SWG thanked Laake for providing this information before the agreed deadline.

4.3.1.2 SPECIFY HOW TEMPORAL AUTOCORRELATION IN THE ABUNDANCE ESTIMATES WILL BE MODELLED

The inter-annual correlation between the PCFG abundance estimates is generally small (maximum 0.215 between the abundance estimates for 2007 and 2008). The SWG **agreed** that this level of correlation is sufficiently low that it is not necessary to take it into account in trials.

4.3.2 Refine the estimates of PCFG/north mixing based on the 2009 photo-ID data

Weller notified the SWG that the 2009 and 2010 photo-id data were not available for use during the current meeting.

4.3.3 Coding and validation

4.3.3.1 TRIALS

The trials specified during the March 2011 AWMP Workshop focused on the performance of *SLA*s for the proposed hunt in the Makah Tribe's U&A, because, except for the proposed Makah hunt and the associated possibility of a stock in the PCFG area, the *Implementation Review* for the ENP gray whales had been completed during the 2010 Annual Meeting. The trials developed during the Workshop considered a number of major hypotheses, including those related to:

(a) MSYR;
(b) levels of immigration;
(c) the level of mixing between PCFG and northern whales when the Makah hunt is likely to take place; and
(d) aspects of the hunt including struck and lost rates.

SC/63/AWMP4 showed how the trials specified during the March 2011 AWMP Workshop led to poor residual patterns for the fits to the revised abundance estimates for the PCFG. It provided a set of revised trials which include a pulse of immigration from the northern into the PCFG stock, in 1999 and 2000. In general, the operating models on which the revised trials are based are able to mimic the abundance data adequately. However, a subset of the trials (e.g. with high annual rates of immigration) are unable to mimic the abundance data well.

The SWG thanked Punt for conducting this intersessional work. The SWG noted that the abundance estimates exhibit a high rate of increase during the early years which is biologically implausible. Pulse immigration was one way to allow the operating model to mimic the abundance data. However, pulse immigration is not the only way to achieve consistency between the operating model and the data. Specifically, an alternative explanation is that the trend in abundance from 1998 to 2002 is not due to immigration, but is instead due to a change in survey bias. It was recognised that neither model adjustment was developed independently of the abundance data. Thus, it was not surprising that models including a change in survey bias or pulse immigration fit the abundance data better than models which have neither effect, and which exhibit a residual pattern as noted in SC/63/AWMP4. Regardless, the SWG recognised the need to explore a plausible range of hypotheses with respect to the rates of increase in the abundance estimates.

The predicted abundance trajectories (historical and future) for the three types of model differ, reinforcing the need to include alternative scenarios for changes in underlying abundance. Witting noted that models based on inertial dynamics were unlikely to be able to mimic the change in abundance estimates better than the other models considered by the SWG due to the short time period of the phenomenon discussed above.

The SWG emphasised that the set of operating models used to test *SLA*s need to cover the plausible range. The SWG discussed the relative plausibility of a change in survey bias. It was noted that there is no direct evidence for such a change, such as marked changes in survey effort and its spatial distribution (although changes in survey effort have occurred - see Appendix 2). Moreover, the trend in abundance for the more intensively surveyed area from Oregon to Northern British Columbia shows the same trend as the entire PCFG area. However, there may be reasons other than a simply change in effort for a change in survey bias. For example, consider the case when individual PCFG whales have very heterogeneous detection probabilities. This would cause a downward bias in estimated abundance. Over several years, the accumulated data might begin to dominate and average away any such bias, leading to the pattern used in the SWG's survey bias model (Fig. 1). Another possible contributor to the (artificial) appearance of survey bias is the approach used for the capture-recapture abundance estimation that an animal is defined as being part of the PCFG only if it is seen in at least two years in the PCFG area.

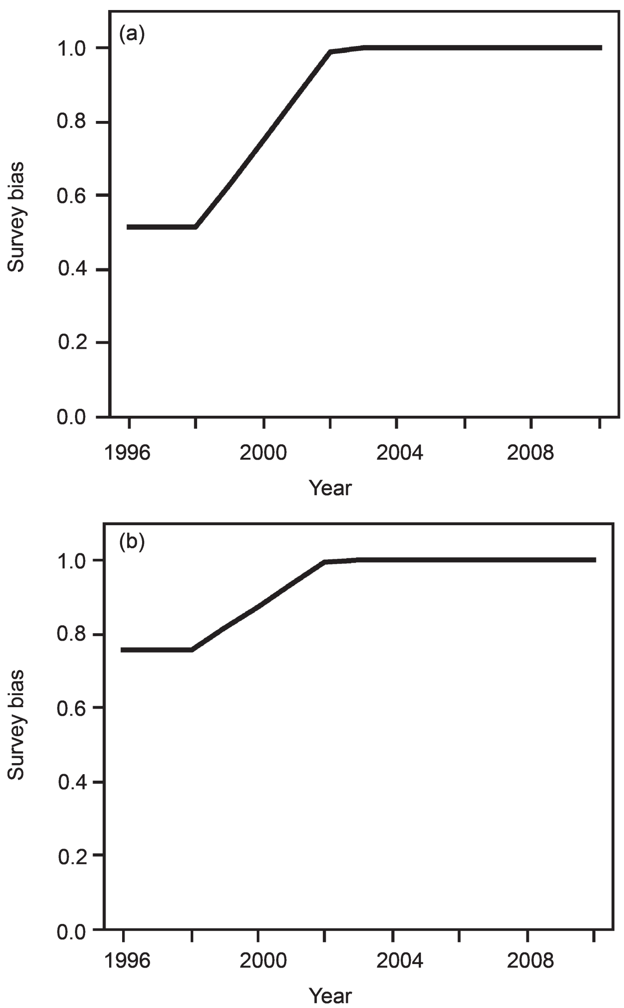

Fig. 1. Bias as a function of time for the 'A' trials (top panel) and the 'Y' trials (bottom panel).

The SWG considered how to best move forward given the concerns with the trials structure established during the March 2011 Workshop and with that in SC/63/AWMP4. Furthermore, although software which could be used to condition and run trials during the meeting was available, the programs have yet to be validated by the Secretariat.

In order to establish a work plan, the SWG identified four 'broad' base-case models which captured hypotheses for the trend in the abundance data for PCFG area.

(1) The 1998 abundance estimate is biased due to 'discovery' and 20 whales immigrated into the PCFG stock from the northern stock in each of 1999 and 2000 (hypothesis E).
(2) There has been no pulse immigration into the PCFG stock; rather the abundance estimates are subject to time-varying bias (Fig. 1a) (hypothesis A).
(3) There has been no pulse immigration into the PCFG stock and the abundance estimates are unbiased (hypothesis X).
(4) 10 whales immigrated into the PCFG stock from the northern stock in each of 1999 and 2000 and the abundance estimates are subject to time-varying bias (but not the extent as for hypothesis A; Fig. 1b) (hypothesis Y).

The SWG then identified a subset of the evaluation trials in SC/63/AWMP4 which cover a range of the factors which might impact eventual performance and could help the SWG select which trials to focus on (Table 2). The factors considered were:

(a) $MSYR_{1+}$;
(b) need in the Russian hunt;
(c) the probability of harvesting a PCFG whale during an April hunt in the PCFG area;
(d) the struck and lost rate in the PCFG hunt;
(e) low-level (non-pulse) immigration into the PCFG stock from the northern stock;
(f) episodic events; and
(g) the sex-ratio of future catches in the PCFG area.

The SWG also selected a number of diagnostic plots and tables to help it understand the behaviour of the models and trials, in order to narrow down the *SLA* testing framework. Among the items considered were:

(1) Time-trajectories of 1+ population size (northern and PCFG stock) in absolute terms and relative to carrying capacity, along with the fits to the abundance estimates. This plot allows an evaluation of whether conditioning has been achieved satisfactorily.
(2) Histograms of the 100 parameter vectors for each trial. This plot allows an evaluation of whether and how conditioning has impacted the priors for these parameters.
(3) Individual time-trajectories of 1+ population size for the northern and PCFG stocks, individual time-trajectories of strikes for the northern and PCFG area, a summary (median and 95% intervals) for the depletion of the PCFG stock, and a summary (median and 95% intervals) for the time-trajectories of 1+ population size when (a) there are no future catches, (b) there are only incidental catches, and (c) there are incidental catches and catches due to hunts in the PCFG and northern area.
(4) Tables showing the statistics selected during the March 2011 Workshop.

Table 2a

The *Evaluation Trials*. Values given in bold type show differences from the base case trial. The values under 'Immigration' only pertain to the 'E' trials. The trials indicated by a 'Y' in the 'Tested' column were considered in detail by the SWG during the meeting.

Trial	Tested	Description	*MSYR*$_{1+}$ north	*MSYR*$_{1+}$ PCFG	Final need	Immigration (%)	Survey freq.	Survey bias (north)	Future survey CV

*To be adjusted based on initial analyses. &The average value for adult survival needs to be adjusted to ensure the population is table for these trials. +The provided CV is half of the true value. %First value is the 1999/2000 immigration and the other number is the non-1999/2000 immigration.

The SWG noted that the time-trajectories of strikes for the PCFG area are uninformative, but that the 'ray plot' developed during the March 2011 Workshop was not more informative. The SWG requested that in the future, the number of strikes of PCFG-stock animals be added to the tabular summary. It was also not possible to condition all of the 'X' and 'Y' trials during the meeting owing to very strong posterior correlations. Specifically, it was not possible during the meeting to obtain 100 unique parameter vectors for the trials in which MSYR$_{1+}$ is 4.5% for the northern stock and 1% for the PCFG stock without adjusting the priors.

The SWG noted that carrying capacity varied among the hypotheses (a wide range for the 'E', 'X' and 'Y' trials and a relatively narrow range for the 'A' trials). The SWG also noted that the results for both the northern and PCFG stocks differed between the various hypotheses even when the remaining specifications were the same (e.g. the final depletion for the northern stock for trials GA03 and GE03). The SWG emphasised the need to fully understand the results before drawing any final conclusions about the relative merits of the four operating models or any changes to the list of evaluation and robustness trials, with the exception that the SWG agreed to move the trial with MSYR$_{1+}$=2% and all future Makah hunting takes PCFG animals to the evaluation set (this is reflected in Table 2).

The SWG established a Steering group (Donovan [Convenor], Allison, Brandon, Butterworth, Givens, Punt, Scordino) to further review the trials structure before the proposed intersessional workshop. The SWG **strongly recommended** that the abundance estimates for the PCFG be updated to include data for 2009 and 2010. A paper presenting all of the abundance estimates should be provided to the SWG.

4.3.3.2 PARAMETER VECTOR GENERATION

This issue will be considered during the next *Implementation Review*.

4.4 Review of results, conditioning and work plan

The SWG was unable to fully review the conditioning because the full set of trials have yet to be completed. Similarly, the SWG did not review the results of the trials.

Table 2b

The Robustness Trials.

Trial	Description	$MSYR_{1+}$ north	$MSYR_{1+}$ PCFG	Final need	Survey freq.	Survey bias (north)	Future survey CV
GR01	5 year surveys	4.5%	4.5%	340 / 7	10/1	1	Base
GR02	Difficult 2%+5yr surveys	2%	2%	340 / 7	10/1	0.5→1	½ CV_{est}
GR03	Linear decrease in *K*	4.5%	4.5%	340 / 7	10/1	1	Base
GR04	Linear increase in PCFG *K*; decrease for North *K*	4.5%	4.5%	340 / 7	10/1	1	Base
GR05	Linear decrease in PCFG *K*; increase for North *K*	4.5%	4.5%	340 / 7	10/1	1	Base
GR07	Linear increase in *M*	4.5%	4.5%	340 / 7	10/1	1	Base
GR08	Linear increase in PCFG *M*	4.5%	4.5%	340 / 7	10/1	1	Base
GR09	Linear increase in north *M*	4.5%	4.5%	340 / 7	10/1	1	Base
GR10	No PCFG whales; ϕ_{PCFG}=0.000	2%	2%	340 / 7	10/1	0.5→1	Base
GR11	Perfect detection; $p_1 = 0$; $p_2 = 0$;	4.5%	4.5%	340 / 7	10/1	1	Base
GR12	Perfect detection; p_1 =0; p2=0.01-0.05	4.5%	4.5%	340 / 7	10/1	1	Base
GR13	Survey bias PCFG + $p_1 = 0.5$	4.5%	4.5%	340 / 7	10/1	1	Base
GR14	Survey bias PCFG + $p_1 = 0.5$	2%	2%	340 / 7	10/1	1	Base
GR15	Correlation (draw for N; same quantile in the range for PCFG)	4.5%	4.5%	340 / 7	10/1	1	Base
GR16	Correlation (draw for N; same quantile in the range for PCFG)	2%	2%	340 / 7	10/1	1	Base
GR17	3 PCFG unepisodic event of 75 years; MSYR=2%	2%	2%	340 / 7	10/1	0.5→1	Base

Details of factors

Factors	Other levels (reference levels shown bold and underlined)
$MSYR_{1+}$	2%, **<u>4.5%</u>**, 6%
Immigration rate (annual)	**<u>0, 2</u>**, 4, 6
Immigration rate (1999/2000)	10, **<u>20</u>**, 30
Proportion of PCFG whales in PCFG area, ϕ_{fut}	0, **<u>0.203</u>**, 1
Struck and lost are	0, **<u>50%,</u>** 100%
Northern need in final year (linear change from 150 in 2009)	**<u>340</u>**, 530
Historic survey bias	**<u>None,</u>** increasing between 1967 to 2002 from 0.5→1 50% (PCFG only)
Survey CV	**<u>BaseCase,</u>** ½ CV_{est}
Future episodic events	**<u>None</u>**, 3 events occur between yrs 1-75 (with at least 2 in yrs 1-50) in which 20% of the animals die, events occur every 5 years in 10% of the animals die
Time dependence in *K*	**<u>Constant</u>**, halve linearly over 100yr
Time dependence in natural mortality, *M* *	**<u>Constant,</u>** double linearly over 100yr
Timing of harvest	**<u>April</u>, May**
Parameter correlations	Yes, **<u>No</u>**
Probability of mismatching north whales, p_2	0, **<u>0.01</u>**, 0.01-0.05
Probability of mismatching PCFG whales, p_1	**<u>0</u>**, 0.5
Frequency of PCFG surveys	**<u>Annual</u>**, 5-year

The SWG **agreed** that its work plan for the 2012 Annual Meeting and associated interessional period would be as follows:

(1) update the output from the control program to include the number of struck PCFG whales [Punt, June 30, 2011] (Item 4.3.3);
(2) validate the control program and the code for implementing the PCFG hunt (Item 4.3.3);
(3) refine the set of trials (Steering Group, Item 4.3.3);
(4) condition all of the trials and conduct all of the projections before the Workshop (Item 4.3.3); and
(5) conduct a Workshop, probably in March 2012 with a focus on the completion of the *Implementation Review* (Item 4), and an initial consideration of operating models for West Greenland fin whales (although progress on all species will be considered).

5. IMPLICATIONS OF NEW INFORMATION ON GRAY WHALE STOCK STRUCTURE

5.1 Summary of relevant BRG discussions (see Annex F)

Kitakado summarised the discussions in the BRG sub-committee related to the implications of western gray whales being seen off the US west coast: (1) there is now more uncertainty regarding Pacific gray whale stock structure; (2) there is no need to revise stock structure assumptions for Pacific gray whales at present; and (3) range-wide studies need to be undertaken to better understand the situation.

5.2 Conclusions with respect to *Implementation Review*

Given the information under Item 5.1, the SWG **agreed** that formally there was no need to modify the existing trials structure which had been designed to evaluate the *SLA*s for the northern and PCFG areas in the context of eastern gray whales. However, this structure does not incorporate conservation implications for western gray whales. Therefore, the SWG **stresses** that the new information on movements of gray whales described under Item 5.1 highlights the importance of further clarification of the stock structure of North Pacific gray whales. In particular, the matches of western gray whales with animals seen in the PCFG area and other areas along the west coast **emphasises** the need for efforts to estimate the probability of a western gray whale being taken in aboriginal hunts for Pacific gray whales. It **strongly endorses** the research programme developed by the BRG sub-committee that focuses on photo-id, genetics and telemetry (see Annex F), incorporating both further analysis of existing data and collection of new data. The results of the research may require further trials for future *SLA* testing; this will certainly be a matter for the next *Implementation Review* if not before. The SWG will continue to monitor discussions within BRG and is willing to respond to any guidance or requests for further information from the Commission.

Final dates for the 2012 meeting are not yet known but likely deadlines for the DAA process are as follows.

- Final datasets available (6 months): 30 November 2011.
- Papers using novel methods (3 months): 28 February 2012.
- Papers using standard methods (2 months): 31 March 2012.
- Papers responding to those above (1 month): 30 April 2012.

6. ANNUAL REVIEW OF MANAGEMENT ADVICE

The SWG recognises the logistical difficulties in collecting samples in remote areas but in order to assist in its work, it **recommends** that biological information and material be collected from as many whales as possible.

6.1 Common minke whales off West Greenland

6.1.1 New information

In the 2010 season, 179 minke whales were landed in West Greenland and 7 were struck and lost (SC/63/ProgRepDenmark). Of the landed whales, there were 122 females, 53 males, and four whales of unreported sex. Witting noted that there are plans to tag minke whales in the coming years to establish correction factors to be applied to future surveys.

6.1.2 Management advice

In 2007, the Commission agreed that the number of common minke whales struck from this stock shall not exceed 200 in each of the years 2008-12, except that up to 15 strikes can be carried forward. In 2009, the Committee was for the first time ever able provide management advice for this stock based on a negatively biased estimate of abundance of 17,307 (95% CI 7,628-39,270) and the method for providing interim management advice which was confirmed by the Commission. Such advice can be used for up to two five-year blocks whilst *SLA*s are being developed (IWC, 2009a, p.16). Based on the application of the agreed approach, and the lower 5th percentile for the 2007 estimate of abundance (i.e. 8,918), the Committee repeats its advice of last year that an annual strike limit of 178 will not harm the stock.

6.2 Common minke whales off East Greenland

6.2.1 New information

Nine common minke whales were struck (and landed) off East Greenland in 2010 (no animals were struck and lost) (SC/63/ProgRepDenmark). Of the landed whales, there were two females, four males, and three whales of unreported sex. The SWG noted that catches of minke whales off East Greenland are believed to come from the large Central stock of minke whales.

6.2.2 Management advice

In 2007, the Commission agreed to an annual quota of 12 minke whales from the stock off East Greenland for 2008-12, which the Committee stated was acceptable in 2007. The present strike limit represents a very small proportion of the Central Stock (see Table 1). The SWG agreed that the present strike limit would not harm the stock.

6.3 Fin whales off West Greenland

6.3.1 New information

A total of four fin whales (all females) were landed, and one struck and lost, in West Greenland during 2010 (SC/63/ProgRepDenmark). An acoustic study on fin whales in Davis Strait between Greenland and Canada found that call frequencies peaked in November-December, and continued until the area was covered by ice in January (Simon *et al.*, 2010).

6.3.2 Management advice

In 2007, the Commission agreed to a quota (for the years 2008-12) of 19 fin whales struck off West Greenland. The Committee agreed an approach for providing interim management advice in 2008 and this was confirmed by the Commission. It had agreed that such advice could be used for up to two five-year blocks whilst *SLA*s were being developed (IWC, 2009a). Based on the application of the agreed approach in 2008 (IWC, 2009a), the SWG agreed that an annual strike limit of 9 whales will not harm the stock.

6.4 Humpback whales off West Greenland

6.4.1 New information

A total of nine (three males; five females; one unreported sex) humpback whales were landed (none were struck and lost) in West Greenland during 2010 (SC/63/ProgRepDenmark). Genetic samples were obtained from five of these whales.

6.4.2 Management advice

In 2007, the Committee agreed an approach for providing interim management advice and this was confirmed by the Commission. It had agreed that such advice could be used for up to two five year blocks whilst *SLA*s were being developed (IWC, 2009a, p.16). Using this approach, as last year, the SWG agreed that an annual strike limit of 10 whales will not harm the stock.

6.5 Humpback whales off St Vincent and The Grenadines

6.5.1 New information

The SWG received no information on 2010-11 catches by St Vincent and The Grenadines. The SWG **strongly recommended** that catch data, including the length of harvested animals, be provided to the Scientific Committee. It also **strongly recommended** that genetic samples by obtained for any harvested animals as well as fluke photographs, and that this information be submitted to appropriate catalogues and collections.

6.5.2 Management advice

In recent years, the Committee has agreed that the animals found off St Vincent and The Grenadines are part of the large West Indies breeding population. The Commission adopted a total block catch limit of 20 for the period 2008-12. The SWG **agreed** that this block catch limit will not harm the stock.

7. ABORGINAL WHALING MANAGEMENT SCHEME

7.1 Draft guidelines for *Implementations* and *Implementation Reviews*

The SWG did not have time to discuss this Item at the meeting. Given this, the SWG **agreed** that the item would be referred to the intersessional workshop and the Chair agreed to circulate a draft proposal at least one month before the Workshop.

7.2 Scientific aspects of an aboriginal whaling scheme

The SWG refers to the previous discussions of this matter and notes that the Commission is still considering the Committee's recommended text on this matter (IWC, 2002a, pp.157-8).

8. PLANNING FOR A BOWHEAD WHALE *IMPLEMENTATION REVIEW*

8.1 Summary of relevant BRG discussions (see Annex F)

Kitakado reported that the BRG sub-committee had received some updates on genetic analyses and age determination of bowhead whales. It also welcomed information on dedicated ice-based abundance surveys (with visual and acoustic components) with independent observers in 2010 and 2011, and a concurrent 2011 aerial photo-id survey. It noted that SC/63/BRG1 had presented a sophisticated method to estimate detection probabilities using the 2010 ice-based data. Work is continuing to develop a new abundance estimate but this is not expected to be completed before 2013.

8.2 Work plan

The purpose of an *Implementation Review* is to examine new information to see if the current situation is outside the parameter space tested in the existing trials. The SWG noted that no information had been presented at the present meeting to suggest that this was the case. It **agreed** that an *Implementation Review* should be scheduled for the 2012 Annual Meeting. In accordance with the Committee's DAA, the following deadlines apply:

Final dates for the 2012 meeting are not yet known but likely deadlines for the DAA process are:

- final datasets available (6 months): 30 November 2011;
- papers using novel methods (3 months): 28 February 2012;
- papers using standard methods (2 months): 31 March 2012; and
- papers responding to those above (1 month): 30 April 2012.

The SWG recognised that it was unlikely that a new abundance estimate would be available for the *Review.* It noted that this is not a required component of an *Implementation Review.* Once an agreed abundance estimate is received it will be incorporated routinely into the *SLA* for the provision of management advice.

9. PROGRESS OF FOLLOW-UP WORK ON CONVERSION FACTORS FOR THE GREENLANDIC HUNT

For indigenous hunting of whales in West Greenland, need is expressed in terms of kilogrammes of edible product (across species), whereas for the development of *SLA*s the SWG approach is to express need in terms of numbers of strikes (per species). Based on the recommendations in the report of the Commission's Small Working Group on Conversion Factors for use in Greenland Hunts (Donovan *et al.*, 2010), the Committee had requested Greenland to provide information on its sampling scheme and data validation protocols to the present meeting. The focus of the recommendations concerned the fin, humpback and bowhead whales for which provisional conversion factors had been proposed; sufficient data had been available to develop a conversion factor for the common minke whale (Donovan *et al.*, 2010).

The SWG received a response to this request (Appendix 4). It was informed that data had been obtained for a small number of humpback whales, fin whales and bowhead whales using a new protocol and with the assistance of wildlife officers. The Greenland Institute of Natural Resources is planning to continue its efforts this year, targeting humpback and bowhead whales, with the effort extending to fin and minke whales in later years. The Greenland Ministry of Fisheries indicated that data collection will have to run for 'quite some years before an appropriate sampling size is reached'.

The SWG welcomed the provision of a report and appreciated and encouraged this work, recognising the logistical difficulty of collecting this kind of data. However, it noted that considerably more detail is needed for it to evaluate the proposed programme; it noted that the authors of the original report had offered to assist in the development of a programme and the SWG **urges** Greenland to take advantage of this offer and it **requests** that a detailed report be presented for consideration at the next meeting.

In particular, the report should provide:

(1) a description of the field protocols and sampling strategy, including effort and likely sample sizes;
(2) a description of analysis methods and models; and
(3) presentation from results thus far, including from preliminary analyses with the available data.

Such information will assist the SWG in addressing issues such as appropriate sample size.

10. WORK PLAN

Details of the work plan can be found under the relevant agenda items. The priority topics for next year will be:

(1) continue work on the development of *SLA*s for the Greenlandic hunts with a focus on common minke whales and fin whales (Item 3);
(2) complete the *Implementation Review* for eastern gray whales with a focus on the PCFG (Item 4);
(3) complete an *Implementation Review* for BCB bowhead whales (Item 8);
(4) develop guidelines for *Implementations* and *Implementation Reviews* (Item 7);
(5) provide management advice for the appropriate subsistence hunts (Item 6); and
(6) review the Greenlandic programme to provide information on conversion factors (Item 9).

Essential components of achieving this work are:

(1) the holding of an intersessional Workshop, probably in March 2012 with a focus on:
    (a) operating models for Greenland fin and minke *SLA* development based on RMP *Implementations* (if time is available, progress on humpback and bowhead whales will also be reviewed);
    (b) gray whale *Implementation Review*;
    (c) draft of guidelines for *Implementation*; and
(2) continuation of the AWMP Developer's Fund.

11. ADOPTION OF REPORT

The report was adopted at 16:22 on 7 June 2011. The SWG thanked Donovan for his predictably excellent chairmanship. Donovan thanked the rapporteurs and particularly Punt for his unstinting dedication to undertaking the computing work and his almost superhuman ability to work without sleep.

AGENDA

1. Introductory items
    1.1 Convenor's opening remarks
    1.2 Arrangements for the meeting
    1.3 Election of Chair
    1.4 Appointment of rapporteurs
    1.5 Adoption of Agenda
    1.6 Documents available
2. Conclusion on the sex ratio method
3. Consideration of work required to develop *SLA*s for all Greenland hunts before the end of the interim period
    3.1 Common minke whales
    3.2 Fin whales
    3.3 Humpback whales
    3.4 Bowhead whales
4. *Implementation Review* of gray whales with emphasis on the PCFG
    4.1 Summary of intersessional workshop
    4.2 Review of information on the PCFG
    4.2 Progress with intersessional tasks
        4.2.1 Finalise the specifications for the trials
        4.2.2 Refine the estimates of PCFG/north mixing based on the 2009 photo-id data
        4.2.3 Coding and validation
        4.2.4 Conditioning
    4.3 Review of results, conclusions and work plan
5. Implications of new information on gray whale stock STRUCTURE (with BRG)
    5.1 Summary of relevant BRG discussions
    5.2 Conclusions with respect to *Implementation Review*
6. Annual review of management advice
    6.1 Common minke whales off West Greenland
    6.2 Common minke whales off East Greenland
    6.3 Fin whales off West Greenland
    6.4 Humpback whales off West Greenland
    6.5 Humpback whales off St Vincent and The Grenadines
7. Aboriginal Whaling Management Scheme
    7.1 Draft guidelines for *Implementations* and *Implementation Reviews*
    7.2 Scientific aspects of an aboriginal whaling scheme
8. Planning for a bowhead whale *Implementation Review* (with BRG)
    8.1 Summary of relevant BRG discussions
    8.2 Work plan
9. Progress on follow-up work on conversion factors for the Greenlandic hunt
10. Work plan
11. Adoption of Report

Appendix 2

ASSESSING POTENTIAL FOR SURVEY BIAS IN THE PCFG TIME SERIES OF ABUNDANCE

J. Brandon, A. Lang, J. Scordino and D. Weller

In discussion of SC/63/AWMP4, the question was posed as to whether the apparent pulse of external recruitment during 1999-2002 might have been due to survey bias. Survey bias could be generated by differences in effort over time or due to differences in the availability of whales over time.

Effort

Based on examination of Calambokidis (2010) and our understanding of survey effort included in that study, there seems to be no dramatic trends in effort over time, although some inter-annual variation has occurred. However, we did find a shift in effort through time in the sub-area of Northern California (NCA)[1]. This shift can be seen in table 7 of Calambokidis (2010) that shows whales seen annually by sub-area. The apparent pulse of early effort in NCA coincided with the Humboldt State (HSU) research group's survey effort during 1998-2002 (with a gap in HSU effort until 2008).

[1]The geographic area (41-52°N) for the proposed abundance estimates is slightly different than those for abundance estimates calculated in Calambokidis (2010), but does include NCA at its southern extent (see fig. 1 of Calambokidis, 2010).

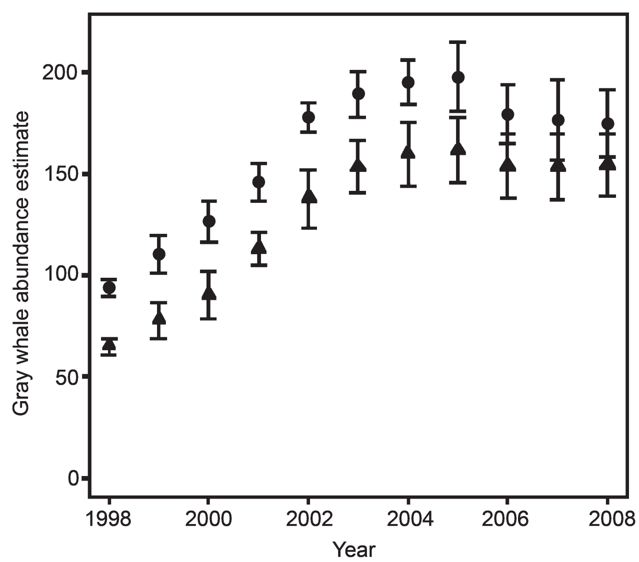

Fig. 1. From Laake (pers. comm.). Plot of PCFG (41-52°) (circle) and OR-NBC (triangle) abundance estimates from 1998-2008 with +/- 1 standard error bars. The OR-NBC abundance estimate excludes data from NCA. NBC=Northern British Colombia, which is at the northern extent of the proposed abundance estimates (see Calambokidis, 2010, fig. 1).

To better understand this issue, Jeff Laake was contacted via e-mail and asked the following question: 'What percentage of the 'Recruited' animals during 1998-2002 (and 2008) entered your updated abundance estimates via photos from NCA?' His response is as follows:

> '… there was effort in NCA and S. Oregon even though we hadn't contracted HSU because CRC[2] sampled in that area (John C[3] can verify that). Also, there is likely quite a bit of shifting in gray whale distribution between NCA and SOR[4]. Secondly, the pattern in the population estimates is the same even if you restrict the estimates to OR-SVI[5] region as shown in the plot I put together for the meeting (see Annex F, SC/63/Rep2). I also went ahead and ran the abundance estimates excluding NCA and you can see that the pattern is the same for it.'

> 'There was certainly a reduction in effort in some years (I believe it was in 2006 where NMML had no funding to provide) and there have also been shifts in whale distribution like in 2007 where whales went off in Oregon and were largely absent from SVI that typically produces the most sightings. However, I don't think this will affect the overall pattern greatly. The 'increase' is certainly influenced by discovery of whales that have been around and not seen, but using the sample of those seen prior to 1998 and not in 1998, this tapered off quickly with most added in 1999 and very few added past 2000'.

Availability

If the availability of whales has shifted through time (for example, if many PCFG whales consistently fed offshore until 1999, then began to use inshore waters more consistently), this could lead to bias in the time series of abundance estimates. Given the data available, however, it is difficult to quantify this hypothesis, and thus to judge its plausibility.

Genetics

If survey bias is not present, the high number of new whales observed in some years of the study suggests external recruitment into the PCFG. Given the high haplotype diversity in the ENP gray whale population, it is likely that recruits would carry haplotypes not previously found in the PCFG. The addition of haplotypes found in single animals into the PCFG sample set would not have a large effect on frequency-based analyses, suggesting that some immigration into the PCFG could occur while maintaining genetic differentiation from the northern feeding group. As well, while photo-identification data may pick up a pulse of new recruits within a season, there would be some time lag before the signature of that pulse is picked up in the genetics. This suggests that a recent and discrete pulse of new animals into the PCFG may not yet have had a large impact on estimates of genetic differentiation. However, it does not seem plausible that we would observe genetic differentiation between the PCFG and northern feeding whales if ~20 animals per year were recruited into the PCFG on a consistent basis.

To better assess the plausibility of these and other scenarios, we suggest that simulations (built on the TOSSM model) could be used in the future to assess the extent of external recruitment into the PCFG that could occur while maintaining genetic differentiation between the PCFG and northern feeding strata.

Appendix 3

GRAY WHALE TRIALS SPECIFICATIONS

This document outlines a set of trials to evaluate the performance of *SLA*s for hunting in the Pacific Northwest, with a primary focus on the PCFG (Pacific Coast Feeding Group). The operating model assumes the two groups (the 'north' group and the PCFG) are separate stocks.

A. The population dynamics model

The underlying population dynamics model is deterministic, age- and sex-structured, and based on a two-stock version of the Baleen II model (Punt, 1999).

A.1 Basic dynamics

Equation A1.1 provides the underlying 1+ dynamics.

$$\begin{aligned} R^{s,m/f}_{t+1,a+1} &= (R^{s,m/f}_{t,a} + I^{s,m/f}_{t,a} - C^{s,m/f}_{t,a})\,\tilde{S}^s_t\,S_a + U^{s,m/f}_{t,a}\,\tilde{S}^s_t\,S_a\,\delta_{a+1} && 0 \le a \le x-2 \\ R^{s,m/f}_{t+1,x} &= (R^{s,m/f}_{t,x} + I^{s,m/f}_{t,x} - C^{s,m/f}_{t,x})\,\tilde{S}^s_t\,S_x + (R^{s,m/f}_{t,x-1} + I^{s,m/f}_{t,x-1} - C^{s,m/f}_{t,x-1})\,\tilde{S}^s_t\,S_{x-1} && \\ U^{s,m/f}_{t+1,a+1} &= U^{s,m/f}_{t,a}\,\tilde{S}^s_t\,S_a\,(1-\delta_{a+1}) && 0 \le a \le x-2 \end{aligned} \tag{A1.1}$$

$R^{s,m/f}_{t,a}$ is the number of recruited males/females of age *a* in stock *s* at the start of year *t*;

$U^{s,m/f}_{t,a}$ is the number of unrecruited males/females of age *a* in stock *s* at the start of year *t*;

$C^{s,m/f}_{t,a}$ is the catch of males/females of age *a* from stock *s* during year *t* (whaling is assumed to take place in a pulse at the start of each year);

δ_a is the fraction of unrecruited animals of age *a*-1 which recruit at age *a* (assumed to be independent of sex and stock);

S_a is the annual survival rate of animals of age *a* in the absence of catastrophic mortality events (assumed to be the same for males and females):

$$S_a = \begin{cases} S_0 & \text{if } a = 0 \\ S_{1+} & \text{if } 1 < a \end{cases} \tag{A1.2}$$

S_0 is the calf survival rate;

S_{1+} is the survival rate for animals aged 1 and older;

$\tilde{S}^s_t$ is the amount of catastrophic mortality (represented in the form of a survival rate) for stock *s* during year *t* (catastrophic events are assumed to occur at the start of the year before mortality due to whaling and natural causes; in general $\tilde{S}^s_t$ =1, i.e. there is no catastrophic mortality);

$I^{s,m/f}_{t,a}$ is the net migration of female/male animals of age *a* into stock *s* during year *t*; and

x is the maximum (lumped) age-class (all animals in this and the *x*-1 class are assumed to be recruited and to have reached the age of first parturition). *x* is taken to be 15 for these trials.

Catastrophic mortality is assumed to be zero (i.e., $\tilde{S}^s_t$ = 1) except for the north stock for 1999 and 2000 when it is assumed to be equal to the parameter $\tilde{S}$. This assumption reflects the large number of dead ENP gray whales observed stranded along the coasts of Oregon and Washington during 1999 and 2000 relative to annual numbers stranding there historically (Brownell *et al.*, 2007; Gulland *et al.*, 2005). The mortality event is assumed to have only impacted the north stock because the abundance estimates for the PCFG stock increased when the mortality event occurred in contrast to those for the north stock which declined substantially.

Immigration only occurs from the north stock to the PCFG stock and only animals aged 1+ immigrate. The annual number of animals immigrating is given by $I_t = \bar{I}\, N_t^{\text{north, 1+}}/20{,}000$ where $\bar{I}$ is the hypothesised recent average number of individuals recruiting into the PCFG from the north stock (i.e., 2, 4 or 6). The annual number of immigrants by age and sex is given by:

$$I^{s,m/f}_{t,a} = I_t \frac{N^{\text{north},m/\text{f}}_{t,a}}{\sum_{a=1}^{x}(N^{\text{north,m}}_{t,a} + N^{\text{north,f}}_{t,a})} \tag{A1.3}$$

A.2 Births

The number of births to stock *s* at the start of year *t*+1, B^s_{t+1}, is given by:

$$B^s_{t+1} = b^s_{t+1} N^{s,f}_{t+1} \tag{A2.1}$$

$N^{s,f}_t$ is the number of mature females in stock *s* at the start of year *t*:

$$N^{s,f}_t = \sum_{a=a_m}^{x} (R^{s,f}_{t,a} + U^{s,f}_{t,a}) \tag{A2.2}$$

a_m is the age-at-maturity (the convention of referring to the mature population is used here, although this actually refers to animals that have reached the age of first parturition);

b^s_{t+1} is the probability of birth/calf survival for mature females:

$$b^s_{t+1} = b_{-\infty}\{1 + A^s(1-(D^s_{t+1}/D^s_{-\infty})^{z^s})\} \tag{A2.3}$$

$b_{-\infty}$ is the average number of live births per year per mature female in the pristine (pre-exploitation) population;

A^s is the resilience parameter for stock *s*;

z^s is the degree of compensation for stock *s*;

D^s_t is the size of the component of stock *s* in year *t* upon which the density-dependence is assumed to act; and

$D^s_{-\infty}$ is the pristine size of the component of stock *s* upon which the density-dependence is assumed to act.

The number of female births, $B_t^{s,f}$, is computed from the total number of the births during year *t* according to the equation:

$$B^{s,f}_t = 0.5\, B^s_t \tag{A2.4}$$

The numbers of recruited/unrecruited calves is given by:

$$\begin{aligned} R^{s,f}_t &= \pi_0\, B^{s,f}_t & R^{s,m}_t &= \pi_0\,(B^s_t - B^{s,f}_t) \\ U^{s,f}_t &= (1-\pi_0)\, B^{s,f}_t & U^{s,m}_t &= (1-\pi_0)(B^s_t - B^{s,f}_t) \end{aligned} \tag{A2.5}$$

π_0 is the proportion of animals of age 0 which are recruited (0 for these trials).

For the trials $D_t^s = N_t^{s,1+}$ and $D^s_{-\infty} = K^{s,1+}$ because density-dependence is assumed to act on the 1+ component of the population and affects fecundity and infant survival. $N_t^{s,1+}$ and $K^{s,1+}$ are defined according to the equations:

$$N^{s,1+}_t = \sum_{a=1}^{x}(R^{s,\mathrm{f}}_{t,a} + U^{s,\mathrm{f}}_{t,a} + R^{s,\mathrm{m}}_{t,a} + U^{s,\mathrm{m}}_{t,a}) \qquad K^{s,1+} = \sum_{a=1}^{x}(R^{s,\mathrm{f}}_{-\infty,a} + U^{s,\mathrm{f}}_{-\infty,a} + R^{s,\mathrm{m}}_{-\infty,a} + U^{s,\mathrm{m}}_{-\infty,a}) \tag{A2.6}$$

A.3 Catches

The historical (*t*<2010) catches by stratum (north, south, PCFG December-May, and PCFG June-November) are taken to be equal to the reported catches (see Table 1). The historical catches are allocated to stocks in fixed proportions as follows.

(1) North area catches: all north animals.
(2) PCFG area catches in December-May: PCFG animals with probability ϕ_{PCFG} (base-case value 0.203, as determined by the photo-ID data).
(3) PCFG area catches in June-November: all PCFG animals.
(4) South area catches: PCFG animals with probability ϕ_{south} (base-case value 0.01, as determined by relative abundance).

Table 1

Historical catches of eastern north Pacific gray whales.

The future catches by stratum are incidental catches and the catches arising from application of the *SLA*s. Subsistence catches are only assumed to occur in the north and the PCFG area from December-May. The sex-ratio of future catches is assumed to be 50:50. The catches are allocated to stock as outlined above, except that the subsistence catches from the PCFG area in June-November are modelled individually. Thus, the catch from the PCFG area is allocated to the PCFG stock based on Bernoulli trials with probability:

$$\frac{\sum_{m/f}\sum_{a'} R^{\text{PCFG,m/f}}_{y,a'}}{\delta\sum_{m/f}\sum_{a''} R^{\text{north,m/f}}_{y,a''}+\sum_{a''} R^{\text{PCFG,m/f}}_{y,a''}} \tag{A3.1}$$

where δ is the relative probability of harvesting a PCFG versus a north animal had the sizes of the two populations been the same. δ is calculated from ϕ under the assumption that the number of PCFG animals is 200 and north animals is 20000, i.e:

$$\delta = (200/\phi - 200)/20000 \tag{A3.2}$$

The incidental catches by stratum for the historical period are computed using the equation:

$$C^{\text{I}/s}_y = \begin{cases} 0.5\left\{p^I - \frac{p^I-1}{69}[y-1999]\right\}\bar{C}^I & \text{if } y \le 1999 \\ \bar{C}^I & \text{otherwise} \end{cases} \tag{A3.3}$$

$C^{\text{I}/s}_y$ is the incidental catch of animals of sex *s* during year *y*;

$\bar{C}^I$ is the mean catch in the stratum (see Table 2).

The catches from the PCFG and north stocks are then allocated to age and size using the formula:

$$C^{s,\text{m}}_{t,a} = C^{s,\text{m}}_t R^{s,\text{m}}_{y,a} / \sum_{a''} R^{s,\text{m}}_{y,a''}; \qquad C^{s,\text{f}}_{t,a} = C^{s,\text{f}}_t R^{s,\text{f}}_{y,a} / \sum_{a''} R^{s,\text{f}}_{y,a''}; \tag{A3.4}$$

The probability of not identifying a PCFG whale as such, is p_2, (base-case value 0) while the probability of incorrectly identifying a north whale as a PCFG whale is p_1 (base-case 0.01). If the survey frequency is not annual, p_2 is defined as:

$$p_{2,t} = 1 - \frac{\sum_{a\ge SF}(R^{\text{north,m}}_{t,a} + R^{\text{north,f}}_{t,a} + U^{\text{north,m}}_{t,a} + U^{\text{north,f}}_{t,a})}{\sum_{a\ge 1}(R^{\text{north,m}}_{t,a} + R^{\text{north,f}}_{t,a} + U^{\text{north,m}}_{t,a} + U^{\text{north,f}}_{t,a})} \tag{A3.5}$$

where SF is the survey frequency for the PCFG area.

Table 2

Average historical incidental catches.

Stratum	Average incidental catch
North	0[1]
PCFG [Dec.-May]	2
PCFG [Jun.-Nov.]	1.4[2]
South	3.4

[1]Obviously not actually zero, but will be small relative to population size.
[2]Includes southern whales during June-November as these whales are almost certainly PCFG animals.

A.4 Recruitment

The proportion of animals of age *a* that would be recruited if the population was pristine is a knife-edged function of age at age 0, i.e.:

$$\pi_a = \begin{cases} 0 & \text{if} \quad a = 0 \\ 1 & \text{otherwise} \end{cases} \tag{A4.1}$$

The (expected) number of unrecruited animals of age *a* that survive to age *a*+1 is $U_{t,a}^{s,m/f}\, S_a$. The fraction of these that then recruit is:

$$\delta_{a+1} = \begin{cases} [\pi_{a+1} - \pi_a]/[1-\pi_a] & \text{if } 0 \le \alpha_a < 1 \\ 1 & \text{otherwise} \end{cases} \tag{A4.2}$$

A.5 Maturity

Maturity is assumed to be a knife-edged function of age at age a_m.

A.6 Initialising the population vector

The numbers at age in the pristine population are given by:

$$\begin{aligned} R_{-\infty,a}^{s,\text{m/f}} &= 0.5 \;\; N_{-\infty,0}^{s} \;\; \pi_a \prod_{a'=0}^{a-1} S_{a'} && \text{if} \quad 0 \le a < x \\ U_{-\infty,a}^{s,\text{m/f}} &= 0.5 \;\; N_{-\infty,0}^{s} \;\; (1-\pi_a) \prod_{a'=0}^{a-1} S_{a'} && \text{if} \quad 0 \le a < x \\ R_{-\infty,x}^{s,\text{m/f}} &= 0.5 \;\; N_{-\infty,0}^{s} \prod_{a'=0}^{x-1} \frac{S_{a'}}{(1-S_x)} && \text{if} \quad a = x \end{aligned} \tag{A6.1}$$

$R_{-\infty,a}^{s,\text{m/f}}$ is the number of animals of age *a* that would be recruited in the pristine population;

$U_{-\infty,a}^{s,\text{m/f}}$ is the number of animals of age *a* that would be unrecruited in the pristine population; and

$N_{-\infty,0}^{s}$ is the total number of animals of age 0 in the pristine population.

The value for $N^s_{-\infty,0}$ is determined from the value for the pre-exploitation size of the 1+ component of the population using the equation:

$$N_{-\infty,0}^{s} = K^{s,1+} \Bigg/ \left(\sum_{a=1}^{x-1} \left(\prod_{a'=0}^{a-1} S_{a'} \right) + \frac{1}{1-S_x} \prod_{a'=0}^{x-1} S_{a'} \right) \tag{A6.2}$$

It is well-known that it is not possible to make a simple density-dependent population dynamics model consistent with the abundance estimates for the eastern north Pacific stock of gray whales (Butterworth *et al.*, 2002; Cooke, 1986; Lankester and Beddington, 1986; Reilly, 1981; 1984). This is why recent assessments of this stock (Punt and Wade, 2010) have been based on starting population projections from a more recent year (denoted as τ) than that in which the first recorded catch occurred. The trials are therefore based on the assumption that the age-structure at the start of τ=1930 is stable rather than that the population was at its pre-exploitation equilibrium size at the start of 1600, the first year for which catch estimates are available. The choice of 1930 for the first year of the simulation is motivated by the fact that the key assessment results are not sensitive to a choice for this year from 1930-1968 (Punt and Butterworth, 2002; Punt and Wade, 2010). Note that even though the operating model ignores the catch data for 1600-1929, these catches are nevertheless provided to the *SLA* for the north area.

The determination of the age-structure at the start of 1930 involves specifying the effective 'rate of increase', γ, that applies to each age-class. There are two components contributing to γ, one relating to the overall population rate of increase (γ^+) and the other to the exploitation rate. Under the assumption of knife-edge recruitment to the fishery at age 1, only the γ^+ component (assumed to be zero following Punt and Butterworth, 2002) applies to ages *a* of age 0. The number of animals of age *a* at the start of τ=1930 relative to the number of calves at that time, $N_{\tau,a}^{s,*}$, is therefore given by the equation:

$$N_{\tau,a}^{s,*} = \begin{cases} 1 & \text{if } a = 0 \\ N_{\tau,0}^{s,*}\, S_0^s & \text{if } a \le 1 \\ N_{\tau,a-1}^{s,*}\, S_{a-1}^s\,(1-\gamma^+) & \text{if } 1 < a < x \\ N_{\tau,x-1}^{s,*}\, S_{x-1}^s (1-\gamma^+)/(1-S_x^s\,(1-\gamma^+)) & \text{if } a = x \end{cases} \tag{A6.3}$$

B_τ^s is the number of calves in year τ (=1930) and is derived directly from equations A2.1 and A2.3 (for further details see Punt, 1999):

$$B_\tau^s = \left(1 - \left[1/(N_\tau^{s,f} b_{-\infty^s}) - 1\right]/A^s\right)^{1/z^s} \frac{D_{-\infty}^s}{D_\tau^{s,*}} \quad \text{(A6.4)}$$

$D_\tau^{s,*}$ is the number of animals in the density dependent component of the population relative to the number of births at that time (see equation A2.6).

The effective rate of increase, γ, is selected so that if the population dynamics model is projected from 1930 to 1968, the size of the 1+ component of the population (both stocks) in 1968 equals a pre-specified value, P_{1968}.

A.7 z and A
A^s, z^s and S_0, are obtained by solving the system of equations that relate *MSYL*, *MSYR*, S_0, S_{1+}, $f_{\max}$ a_m, A^s and z^s, where $f_{\max}$ is the maximum theoretical pregnancy rate (Punt, 1999).

A.8 Conditioning
The method for conditioning the trials (i.e. selecting the 100 sets of values for the parameters a_m, S_0, S_{1+}, $\tilde{S}$, K_{1+}^{NORTH}, K_{1+}^{PCFG}, A^{NORTH}, A^{PCFG}, Z^{NORTH} and z^{PCFG}) is based on a Bayesian assessment of the eastern North Pacific stock of gray whales (Punt and Butterworth, 2002; Wade, 2002). The algorithm for conducting the Bayesian assessment is as follows.

Table 3
The prior distributions for the eastern north Pacific stock of gray whales.

Parameter	Prior distribution
Non-calf survival rate, S_{1+}	U[0.95, 0.999]
Age-at-maturity, a_m	U[6, 12]
K_{1+}^{NORTH}	U[16,000, 70,000]
K_{1+}^{PCFG}	U[100, 500]
Maximum pregnancy rate, $f_{\max}$	U[0.3, 0.6]
Additional variation (population estimates), CV_{add}, in 1968	U[0, 0.35]
1968 abundance, P_{1968}^{NORTH}	U[8,000, 16,000]
1968 abundance, P_{1968}^{PCFG}	U[50, 300]
Catastrophic mortality, $\tilde{S}$	U[0.2,1.0]

(a) Draw values for the parameters S_{1+}, $f_{\max}$, a_m, K_{1+}^{NORTH}, K_{1+}^{PCFG}, P_{1968}^{NORTH}, $\tilde{S}$, CV_{add}^{NORTH} (the additional variance for the estimate of 1+ abundance Carmel, California in 1968), CV_{add}^{PCFG} (the additional variance for the estimate of 1+ abundance from North California to Southeast Alaska in 1968 – had such a survey taken place) from the priors in Table 3. It is not necessary to draw values for $MSYR_{1+}$ and $MSYL_{1+}$ because the values for these quantities are pre-specified rather than being determined during the conditioning process.

(b) Solve the system of equations that relate $MSYL_{1+}{}^s$, $MSYR_{1+}{}^s$, S_0, S_{1+}, $f_{\max}$, a_m, A^s and z^s to find values for S_0, A^s and z^s.

(c) Calculate the likelihood of the projection for each area, given by

$$-\ell nL = 0.5\ell n\,|\mathbf{V}+\Omega| + 0.5\sum_i\sum_j(\ell nN_i^{\text{obs}} - \ell n\hat{P}_i^{1+})[(\mathbf{V}+\Omega)^{-1}]_{i,j}(\ell nN_j^{\text{obs}} - \ell n\hat{P}_j^{1+}) \quad \text{(A8.1)}$$

N_i^{obs} is the i^{th} estimate of abundance[1] (Tables 4a, 4b),

$\hat{P}_i$ is the model-estimate corresponding to N_i^{obs},

V is the variance-covariance matrix for the abundance estimates, and

Ω is a diagonal matrix with elements given by $E(CV_{add,t}^2)$:

[1]The shore-based abundance estimate for year *y*/*y*+1 is assumed to pertain to abundance at the start of year *y*+1.

$$E(CV^2_{add,t}) = \eta(0.1 + 0.013P^* / \hat{P}_t) = CV^2_{add} \frac{0.1 + 0.013P^* / \hat{P}_t}{0.1 + 0.013P^* / \hat{P}_{1968}} \quad \text{(A8.2)}$$

(a) Steps (a)-(c) are repeated a large number (typically 1,000,000) of times.

(b) 100 sets of parameters vectors are selected randomly from those generated using steps (a)-(c), assigning a probability of selecting a particular vector proportional to its likelihood. The number of times steps (a)-(c) are repeated is chosen to ensure that each of the 100 parameter vectors are unique.

The expected value for the estimate of abundance of the north area is taken to the total abundance (PCFG and north stocks combined) while the abundance estimates for the PCFG area are assumed to pertain to the PCFG stock.

B. Data generation

B.1 Absolute abundance estimates

The historic (t<2010) abundance estimates (and their CVs) are provided to the *SLA* and are taken to be those in Tables 4a and 4c. Future estimates of absolute abundance (and their estimated CVs) are generated and provided to the *SLA* once every F years during the management period (starting in year 2011 where F=10 for the northern area and F=1 for the PCFG area). The CV of the abundance estimate (CV_{true}) may be different from the CV provided to the *SLA* (further details are provided below).

The survey estimate, $\hat{S}$, may be written as:

$$\hat{S} = B_A PY w / \mu = B_A P^* \beta^2 Y w \quad \text{(B1.1)}$$

B_A is the bias (the bias for the bulk of the simulations for the north area is 1 while the bias for PCFG area is generated from $\ell n B_A \sim N(-0.335, 0.112)$ – this bias reflects the difference between the abundance estimates on which the ABL is based [which pertain to Oregon to Southern Vancouver Island] and the abundance of the entire stock];

P is the current total 1+ population size ($= N_t^{1+}$); (B1.2)

Y is a lognormal random variable: $Y = e^{\phi}$ where: $\phi \sim N[0; \sigma_\phi^2]$ and $\sigma_\phi^2 = \ell n(1+\alpha^2)$ (B1.3)

w is a Poisson random variable, independent of Y, with $E(w) = \text{var}(w) = \mu = (P / P^*) / \beta^2$; and (B1.4)

P^* is the reference population level (the pristine 1+ population, $= K^{1+}$).

Note that under the approximation $CV^2(ab) = CV^2(a) + CV^2(b)$,

$$E(\hat{S}) = B_A P_t \text{ and } CV^2_{true}(\hat{S}) = \alpha^2 + \beta^2 P^* / P \quad \text{(B1.5)}$$

The steps used in the program to generate the abundance estimates and their CVs are given below[2].

The *SLA* is provided with estimates of CV_{est} (the estimation error associated with factors considered historically) for each future sightings estimate.

The estimate of $CV_{est,t}$ is given by:

$$\hat{C}V_{est,t} = \sqrt{\sigma_t^2 (\chi_n^2 / n)} \qquad \sigma_t^2 = \ell n(1 + E(CV^2_{est,t})) \quad \text{(B1.6)}$$

$E(CV^2_{est,t})$ is the sum of the squares of the actual CVs due to estimation error:

$$E(CV^2_{est,t}) = \theta^2 (a^2 + b^2 / w\beta^2) \quad \text{(B1.7)}$$

χ_n^2 is a random number from a χ^2 distribution with n (=19; the value assumed for the single stock trials for the RMP) degrees of freedom;

[2]The steps used to generate estimates of abundance and their CVs are as follows (steps (i)-(iii) are part of the conditioning process).

(i) Read in CV_{est} (basecase value= 0.075 = value used to generate the 1968 abundance). Generate values of CV^2_{add} for 1968.

(ii) Set η using equation B1.8b and the value of CV_{add} generated in step (i).

(iii) Set θ_2 using equation B1.7a and the values for CV_{est} from step (i) and $w\beta^2 = P / P^* = P_{1968} / P^*$. Set α_2 and β_2 using equation B1.9.

(iv) Generate w (Poisson random variable – see equation B1.4) and ϕ (lognormal random variable – see equation B1.3).

(v) Set abundance estimate $\hat{S}$ using equation B1.1.

(vi) Set $E(CV^2_{est,t})$ using equation B1.7a.

(vii) Generate $\hat{C}V_{est,t}$ from a χ^2_n distribution using equation B1.6a.

a^2, b^2 are constants and equal to 0.02 and 0.012 respectively.

The relationship between CV_{est} and CV_{true} is given by:

$$\eta = [E(CV_{true}^2) - E(CV_{est}^2)] / (0.1 + 0.013P^* / P) \quad \text{(B1.8a)}$$

where η is a constant known as the additional variance factor. The value of η is based on the population size and CVs for 1968 (for consistency with the way the CV for P_{1968} is generated in Table 3):

$$\eta = CV_{add}^2 / (0.1 + 0.013P^* / P_{1968}) \quad \text{(B1.8b)}$$

The values of α and β are then computed as:

$$\alpha^2 = \theta^2 a^2 + \eta\, 0.1\,, \qquad \beta^2 = \theta^2 b^2 + \eta\, 0.013 \quad \text{(B1.9)}$$

Table 4a

2003	153	0.085			

C. Need

The level of need in each year, Q_t, will be supplied to the *SLA*. The need is given by $Q_t = Q_{2010} + \frac{t-2010}{100}(Q_{2110} - Q_{2010})$ where Q_{2010} (=150/7 for the north and PCFG areas respectively) is the need at the start of the first year in which the AWMP is applied and Q_{2110} is the value 100 years later. The level of need supplied.

D. Implementing the Makah harvest regime
The overall application of the Makah management regime is as follows.

(1) Compute the ABL (Allowable Bycatch Limit of PCFG whales).

(2) Strike an animal.

(3) If the animal is struck-and lost in December-April[3]:

(a) if the total number of struck and lost animals is 3, stop the hunt;

(b) if the total number of struck animals equals the need of 7 stop the hunt;

(b) go to step (2).

(4) If the animal is struck-and lost in May:

(a) add one to the number of whales counted towards the ABL;

(b) if the ABL is reached, stop the hunt;

(c) if the total number of struck and lost animals is 3, stop the hunt;

(d) if the total number of struck animals equals the need of 7, stop the hunt;

(e) go to step (2).

(5) If the animal is landed and is matched against the catalogue[4]:

(a) add one to the number of whales counted towards the ABL;

(b) if the ABL is reached, stop the hunt;

(c) if the total number of landed whales equals 5, stop the hunt;

(d) if the total number of struck animals equals the need of 7, stop the hunt;

(e) if the number of landed whales for the current five-year block equals 20, stop the hunt;

(f) go to step (2).

(6) If the animal is landed and does not match any whale in the catalogue:

(a) if the total number of landed whales equals 5, stop the hunt;

(b) if the total number of struck animals equals the need of 7, stop the hunt;

(c) if the number of landed whales for the current five-year block equals 20, stop the hunt;

(d) go to step (2).

E. Statistics
The risk- and recovery-related performance statistics are computed for the mature female and for the total (1+) population sizes (i.e. P_t is either the size of the mature female component of the population, N^f_t, or the size of the total (1+) population, N_t^{1+}). P_t^* is the population size in year t under a scenario of zero strikes in the northern and PCFG area (but allowing for incidental catches) over the years $t \geq 2010$ (defined as $t=0$ below), P_t^{**} is the population size in year t under a scenario of zero strikes in the PCFG area (but allowing for incidental catches and strikes in the north area) over the years $t \geq 2010$ (defined as $t=0$ below), and K_t^* is the population size in year t if there had never been any harvest.

The trials are based on a 100-year time horizon, but a final decision regarding the time horizon will depend *inter alia* on interactions between the Committee and the Commission regarding need envelopes and on the period over which recovery might occur. To allow for this, results are calculated for T=20 and 100.

Statistics marked in bold face have previously been considered the more important. Note that the statistic identification numbers have not been altered for reasons of consistency. Hence, there are gaps in the numbers where some statistics have been deleted.

E.1 Risk
D1. Final depletion: P_T/K. In trials with varying K this statistic is defined as P_T/K_t^*.

[3]Whether a whale is struck and lost is determined from a Bernoulli trial with probability 0.5 (base-case).
[4]PCFG whales are mismatched as north stock whales with probability p_2 while north stock whales are matched to the catalogue with probability p_1.

D2. Lowest depletion: $\min(P_t / K)$: $t = 0,1,\ldots,T$. In trials with varying K this statistic is defined as $\min(P_t / K_t^*)$: $t = 0,1,\ldots,T$.

D6. Plots for simulations 1-100 of $\{P_t : t = 0,1,..,T\}$, $\{P_t^*: t = 0,1,..,T\}$, $\{P_t^{**}: t = 0,1,..,T\}$.

D7. Plots of $\{P_{t[x]}: t = 0,1,..,T\}$ $\{P_t^*{}_{[x]}: t = 0,1,..,T\}$ and $\{P_t^{**}{}_{[x]}: t = 0,1,..,T\}$ where $P_{t[x]}$ is the xth percentile of the distribution of P_t. Results are presented for $x = 5$ and $x = 50$.

D8. Rescaled final population: P_T/P_T^* and P_T/P_T^{**}.

D9. Minimum population level in terms of mature females, $\min(P_t)$: $t = 0,1,\ldots,T$.

D10. Relative increase P_T/P_0.

E.2 Need (for PCFG, statistics N1-N12 will be computed for the total number of strikes as well as the number of landed animals).

N1. Total need satisfaction: $\sum_{t=0}^{T-1} C_t / \sum_{t=0}^{T-1} Q_t$

N2. Length of shortfall = (negative of the greatest number of consecutive years in which $C_t < Q_t$) / T.

N4. Fraction of years in which $C_t = Q_t$.

N5. Proportion of block need satisfaction: $\Gamma/(T-h+1)$ where Γ is the number of blocks of h years in which the total catch equals the total need; h is 5 for these trials.

N7. Plot of $\{V_{t[x]}$: t=0,1, T - 1$\}$ where $V_{t[x]}$ is the xth percentile of the distribution of $V_t = C_t / Q_t$ [catch for the PCFG area].

N8. Plots of V_t for simulations 1-100.

N9. Average need satisfaction: $\frac{1}{T}\sum_{t=0}^{T-1}\frac{C_t}{Q_t}$

N10. AAV (Average Annual Variation): $\sum_{t=-1}^{T-2}\left|C_{t+1} - C_t\right| / \sum_{t=-1}^{T-2} C_t$

N11. Anti-curvature: $\frac{1}{T-1}\sum_{t=0}^{T-2}\left|\frac{C_t - M_t}{\max(10, M_t)}\right|$ where $M_t = (C_{t+1} + C_{t-1}) / 2$

N12. Mean downstep (or modified AAV): $\sum_{t=-1}^{T-2}\left|\min(C_{t+1} - C_t, 0)\right| / \sum_{t=-1}^{T-2} C_t$

N13. Average annual number of animals landed.

N14. Average annual number of animals struck and lost.

N15. Ray plot. For each simulation, make a line plot of cumulative absolute year-to-year quota changes versus time (x-axis). Superimpose all these rays.

Appendix 4

GREENLANDIC RESPONSE TO 'ITEM 9.1 CONVERSION FACTORS FOR EDIBLE PRODUCTS FOR GREENLAND FISHERIES' FROM THE IWC SCIENTIFIC COMMITTEE MEETING, 2010

Ministry of Fisheries, Hunting and Agriculture, Government of Greenland

The SWG requested Greenland to provide information on its sampling scheme and data validation protocols at this year's SC meeting.

Shortly after the 62nd Annual IWC meeting, a meeting between hunters, scientists, wildlife officers and managers concerning a revised sampling scheme resulted in a suggestion of using bins for the collection of the three types of edible products, weighing one and counting how many times it was filled with each product as a way of validating the total weight measurements.

This suggestion was implemented by including it in the Executive Order (nr. 11, 16 July 2010) regulating the hunt on large whales. Normally, it takes at least three months to prepare a new executive order due to the hearing process. Because of its importance, the Greenland Cabinet made a decision to implement the executive order with a shorter hearing process.

Furthermore an instruction on how to collect relevant data has been made to the wildlife officers following a hunt and a flensing situation on bowhead and humpback whales.

Focusing on the largest species, since the implementation of the extended sampling scheme 10 humpback whales (9 in 2010 and 1 in 2011), 2 fin whales (2010) and 1 bowhead whale (2011) have been caught in Greenland. Of these 13 catches, wildlife officers were able to follow the hunt of the bowhead whale and 2 humpback whale catches. During the last three hunting seasons all 7 bowhead whale caught in Greenland have been followed by wildlife officers and/or scientists/managers resulting in a working paper presented at IWC and a scientific paper under review. This covering has required a high level of effort and resources from the wildlife officers and the scientist/managers involved.

The Greenland Institute of Natural Resources are planning to have 2-3 persons collecting samples from this years hunt on humpback whales in Mid-Greenland (3 animals). During this field work an effort for estimating bin weight of the three types of edible products will also be prioritised. The plan is to extend this work to fin whales and minke whales.

Experience, especially on challenges of organising the practicalities so far, shows that this revised data collection will have to run for quite some years before an appropriate sample size is reached.

Report of the Scientific Committee

The meeting was held at El Panama Hotel and Conference Centre, Panama from 11-23 June 2012 and was chaired by Debra Palka. A list of participants is given as Annex A.

1. INTRODUCTORY ITEMS

1.1 Chair's welcome and opening remarks
The Chair welcomed the participants to the 2012 IWC Scientific Committee meeting noting that the Committee faced a long and complex Agenda this year. In particular, she thanked the Government of Panama for providing the facilities for this year's meeting and the IWC Commissioner for Panama, Tomas Guardia for his assistance. The Committee paused in silence for Alexandre de Lichtervelde, the previous Commissioner from Belgium who had been deeply involved in the issue of ship strikes, and Frank Hester, a long time Scientific Committee member, who had both sadly passed away since the last meeting. They both will be greatly missed.

Simon Brockington, the Executive Secretary to the IWC, addressed the meeting on behalf of the Commission to convey a message of gratitude. He noted that the Scientific Committee is rightly regarded as one of the foremost international fora dedicated to cetaceans, and that this reputation stemmed from the quality of research conducted by the participants. He hoped that the meeting would be productive both in terms of providing advice to the Commission, but also in allowing knowledge to be gained and shared between participants so as to allow improved research in the future. He wished all participants a successful meeting.

On behalf of the Government of Panama, Giovanni Lauri, the Administrator General of the Aquatic Resources Authority of Panama (ARAP) addressed the Committee and welcomed the participants to Panama. He hoped that everyone would enjoy their time in Panama City and wished the meeting every success.

1.2 Appointment of rapporteurs
Donovan was appointed rapporteur with assistance from various members of the Committee as appropriate. Chairs of sub-committees and Working Groups appointed rapporteurs for their individual meetings.

1.3 Meeting procedures and time schedule
Brockington summarised the meeting arrangements and information for participants. The Committee agreed to follow the work schedule prepared by the Chair.

1.4 Establishment of sub-committees and working groups
As intimated last year, (IWC, 2012f, p.59) and included in the draft agenda, a pre-meeting of the Standing Working Group on Environmental Concerns met from 9-10 June 2012 in Panama City to consider interactions between marine renewable energy developments and cetaceans. Its report is given as SC/64/Rep6.

A number of sub-committees and Working Groups were established. Their reports were either made annexes (see below) or subsumed into this report (see Items 17 and 19).

Annex D – Sub-Committee on the Revised Management Procedure (RMP);
Annex D1 – Working Group on the *Implementation Review* of Western North Pacific common minke whales (NPM);
Annex E – Standing Working Group on an Aboriginal Whaling Management Procedure (AWMP);
Annex F – Sub-Committee on Bowhead, Right and Gray Whales (BRG);
Annex G – Sub-Committee on In-Depth Assessments (IA);
Annex H – Sub-Committee on Other Southern Hemisphere Whale Stocks (SH);
Annex I – Working Group on Stock Definition (SD);
Annex J – Working Group on Estimation of Bycatch and other Human-Induced Mortality (BC);
Annex K – Standing Working Group on Environmental Concerns (E);
Annex K1– Working Group to Address Multi-species and Ecosystem Modelling Approaches (EM);
Annex L – Standing Sub-Committee on Small Cetaceans (SM);
Annex M – Sub-Committee on Whalewatching (WW); and
Annex N – Working Group on DNA (DNA).

1.5 Computing arrangements
Allison outlined the computing and printing facilities available for delegate use.

2. ADOPTION OF AGENDA

The Adopted Agenda is given as Annex B1. Statements on the Agenda are given as Annex R. The Agenda took into account the priority items agreed last year and approved by the Commission (IWC, 2012a, pp.27-29). Annex B2 links the Committee's Agenda with that of the Commission.

3. REVIEW DATA, DOCUMENTS AND REPORTS

3.1 Documents submitted
Donovan noted that the pre-registration procedure, coupled with the availability of electronic papers, had again been successful. With such a large number of documents, pre-specifying papers had reduced the amount of photocopying and unnecessary paper dramatically. He was pleased to note that this year the percentage of people opting to receive their papers entirely electronically had continued to grow. As last year, the Secretariat provided participants with a memory stick with all of the papers that had been received by the official deadline. Revised or new papers and reports were uploaded onto the IWC website. The list of documents is given as Annex C. The issue of electronic papers is discussed further under Item 24.

3.2 National Progress Reports on research
The Committee is in the transition phase from receiving paper Progress Reports to online submission into a database. A Working Group was established to facilitate this process and its report is given as Annex O. The Committee **reaffirms** its view of the importance of national Progress Reports and **recommends** that the Commission continues to urge member nations to submit them following the new online system. It thanks the Secretariat and especially Tandy and Miller for their development work on the portal.

Table 1
List of data and programs received by the IWC Secretariat since the 2011 meeting.

Date	From	IWC ref.	Details
Catch data from the previous season			
08/07/11	St Vincent: R. Ryan	E103 Cat2011	Information on the St. Vincent and The Grenadines humpback harvest 2011 season.
01/03/12	Canada: A. McMaster	E103 Cat2011	Information on the Canadian bowhead harvest 2011 season.
30/03/12	Iceland: E. Thordarson	E103 Cat2011	Individual catch records from the Icelandic commercial catch 2011.
22/05/12	Russia: R.G. Borodin	E103 Cat2011	Individual catch records from the aboriginal harvest in the Russian Federation in 2011.
24/05/12	Norway: N. Øien	E103 Cat2011	Individual minke records from the Norwegian 2011 commercial catch. Access restricted (specified 14/11/00).
11/06/12	Japan: S. Hiruma	E103 Cat2011	Individual data for Japan special permit catch, 2011, N Pacific (JARPN II) and 2011/12, Antarctic (JARPA II).
Other catch data			
10/04/12	Canada: J. Ford	E105	Comparison of N Pacific catch data held by Canada with the IWC database, including 1,471 new individual records.
Sightings data			
01/12/11	K. Matsuoka	E102	2011 POWER cruise sightings data.
22/12/11	K. Matsuoka	E102	Data from the JARPN II sighting survey in the North Pacific 2011 (Matsuoka *et al.*, 2011); inc. sightings, weather, effort and distance and angle experiment data.
Other			
30/11/11	USA: D. Palka	E101	List of data for the NP gray whale *Implementation Review* in June 2012.
23/03/12	A. Punt	E104	Programs and data used in AWMP gray whale trials up to March 2012 Workshop.
23/06/12	A. Punt	E104	Programs and data used in AWMP gray whale trials at the 2012 Scientific Committee.

3.3 Data collection, storage and manipulation

3.1.1 Catch data and other statistical material

Table 1 lists data received by the Secretariat since the 2011 meeting. As requested last year, the Secretariat had contacted both Canada and Indonesia to request information on recent catches. The information received from Canada is included in Table 1, but no response has been received to date from Indonesia. The Committee **requests** that the Secretariat try again to obtain data on catches off Indonesia.

3.1.2 Progress of data coding projects and computing tasks

Allison reported that Version 5.2 of the catch database was released in November 2011 and a new release was due shortly. Work has continued on the entry of catch data into both the IWC individual and summary catch databases, including data received from the 2010 season. Sightings data from the 2010 POWER cruise (see Item 10.8) has been validated.

Programming work during the past year has focused on amending the control program and datasets for use in the North Pacific common minke whale *Implementation* trials and is discussed further under Item 6.3.

4. COOPERATION WITH OTHER ORGANISATIONS

The Committee noted the value of co-operation with other international organisations to its work. The observers' reports below briefly summarise relevant meetings of other organisations but the contributions of several collaborative efforts are dealt with in the relevant sub-committees.

4.1 Convention on the Conservation of Migratory Species (CMS)

4.1.1 Scientific Council

The report of the IWC observer at the CMS Scientific Council meeting held in Bergen, Norway from 17-18 September 2011 is given as IWC/64/4E. With relation to cetaceans, their agenda included items on critical sites and ecological networks for migratory species, impacts of marine debris on migratory species and presentation of the report of the Working Group on Aquatic Mammals. It was agreed that the narwhal and the North Pacific killer whale populations be considered for cooperative action. A draft resolution on a programme of work for cetaceans (to implement the previous CoP resolution 'Adverse human-induced impacts on cetaceans') was endorsed. Note was taken of the recent split of the finless porpoise into two species, *Neophocaena brevirostris* and *N. asiaeorientalis* and both were recommended for inclusion in Appendix II of the Convention.

The Committee thanked Perrin for his report and **agrees** that he should represent the Committee as an observer at the next CMS Scientific Council meeting. Further information can be found at *http://www.cms.int*.

4.1.2 Conference of Parties

The report of the IWC observer at the 10th Conference of Parties for CMS held in Bergen 20-25 September 2011 is given as IWC/64/4E. The Convention now has 117 Parties. Three Resolutions related primarily to cetaceans:

Resolution 10.14 *Bycatch of CMS-listed species in gillnet fisheries* called on Parties to *inter alia* assess the risk of bycatch arising from their gillnet fisheries and conduct research to identify and improve mitigation measures (including use of alternative fishing gear and methods) and instructed the Scientific Council to develop terms of reference for studies identifying the degree of interaction between gillnet fisheries and CMS-listed species;

Resolution 10.15 *Global programme of work for cetaceans* laid out tasks for the Scientific Council, Secretariat and Parties to advance the conservation of CMS-listed cetaceans, organised primarily on a regional basis; and

Resolution 10.24 *Further steps to abate underwater noise pollution for the protection of cetaceans and other migratory species* among other recommendations strongly urged the Parties to prevent adverse effects on cetaceans and other marine species by restricting the emission of underwater noise, understood as keeping it to the lowest necessary level with particular priority given to situations where the impacts on cetaceans are known to be heavy.

The resolutions can be seen in full on the CMS website (*http://www.cms.int.*).

The Committee thanked Perrin for his report and **agrees** that he should represent the Committee as an observer at the next CMS Scientific Council meeting.

4.1.3 Agreement on Small Cetaceans of the Baltic and North Seas (ASCOBANS)

There was not a meeting of parties in the intersessional period. The next meeting of parties will take place on 22-24 October 2012 in Brighton, UK. The report of the observer at the 19th meeting of the Advisory Committee to ASCOBANS held in Galway, Ireland 20-22 March 2012 is given as IWC/64/4F. Topics covered included:

(1) *Baltic Sea harbour porpoises*. Those in the Western Baltic, Belt Seas and the Kategat form a different population to those of the Baltic proper and the North Sea and since 2005 there has been a 60% decline in the population size of the former. A separate conservation plan for this area should be established.
(2) *Working Group on a Conservation Plan for Harbour Porpoises in the North Sea*. A follow-up SCANS II survey was recommended, as was bringing smaller and recreational fisheries under the reformed Common Fisheries Policy.
(3) *Working Group on Bycatch*. A review of the 1.7% removal rate was recommended.
(4) *Dogger Bank surveys*. Independent surveys, both aerial and vessel-based, indicate that the harbour porpoise is the most common cetacean in the area, with most records on the slopes of the bank.
(5) *Small cetacean hunt outside agreement area*. Tagging data indicates the pilot whale population subject to the Faroese hunt also occurs in the ASCOBANS agreement area. Because of considerable uncertainties regarding the population ASCOBANS welcomes future studies (e.g. SCANS, CODA, T-NASS).

A working group on marine debris was established and in collaboration with ACCOBAMS, the ASCOBANS Secretariat is working to acquire satellite-based data on shipping density to identify high risk areas and trends. A joint ECS/ASCOBANS/ACCOBAMS workshop on management of Marine Protected Areas (MPAs) for cetaceans will be held at the 2013 ECS conference.

The Committee thanked Scheidat for her report and **agrees** that she should represent the Committee as an observer at the next ASCOBANS Advisory Committee meeting and Meeting of Parties. Further information can be found at *http://www.ascobans.org*.

4.1.4 Agreement on the Conservation of Cetaceans of the Black Sea, Mediterranean Sea and Contiguous Atlantic Area (ACCOBAMS)

No meetings of ACCOBAMS occurred intersessionally, but a Scientific Committee meeting is scheduled for November 2012. The Committee **agrees** that Donovan should represent the IWC at this meeting.

4.1.5 Memorandum of Understanding (MoU) on the Conservation of the Manatee and Small Cetaceans of Western Africa and Macaronesia

There was no report related to the MoU on the Conservation of the Manatee and Small Cetaceans of Western Africa and Macaronesia. Perrin will represent the Committee at future activities.

4.1.6 Memorandum of Understanding (MoU) for the Conservation of Cetaceans and Their Habitats in the Pacific Islands Region (MoU for Pacific Islands Cetaceans)

There was no report related to the MoU for Pacific Islands Cetaceans. Donohue will represent the Committee at future activities. Further information can be found at *http://www.pacificcetaceans.org*.

4.2 International Council for the Exploration of the Sea (ICES)

The report of the IWC observer documenting the 2012 activities of ICES is given as IWC/64/4A. The ICES Working Group on Marine Mammal Ecology (WGMME) met in February 2011. It conducted a review of the effects of tidal turbines on marine mammals and provided recommendations on research, monitoring and mitigation schemes. The working group recommended identification of sites of low risk for turbine deployments before consenting to further devices or upscaling in more sensitive sites. It also recommended extreme care when extrapolating environmental impacts between species and device types and caution when scaling up environmental lessons learned from studies of single turbines.

Marine spatial planning practices were considered by the working group. It recommended that data on cetacean presence and occurrence be incorporated at a very early stage of planning and it emphasised the importance of including information on seasonal changes in distribution. Due to the wide-ranging nature of cetaceans the relevance of 'important areas' outside MPAs should be assessed within marine spatial plans.

The working group discussed designation of MPAs. It recommended that the boundaries should be decided based on long-term data series (of at least five years). Creation of MPAs in response to public opinion without scientific evidence to support their selection risks providing false assurances and could reduce the pressure for targeted action on the most significant threats.

The Working Group on Bycatch of protected species (WGBYC) met in February 2011. It reviewed the status of information on recent bycatch estimates and assessed the extent of the implementation of bycatch mitigation measures. Reports from 15 member states indicated extrapolated estimates of bycatch for 2009 of 879 striped dolphins, 1,500 common dolphins, 11,000 harbour porpoises and at least 10 bottlenose dolphins in a variety of fisheries. Estimates are patchy and monitoring obligations not being met by several member states. Implementation of bycatch mitigation measures was also found to be poor, with few countries able to confirm that obligations for pinger deployment were being met.

The 2011 ICES Annual Science Conference (ASC) was held in Gdansk, Poland, 19-23 September 2011. Some sessions were designed with marine mammals included as an integral part. A number of sessions were of relevance to the Committee, including those describing:

(1) integration of top predators into ecosystem management;
(2) integration of multi-disciplinary knowledge in the Baltic Sea to support science-based management; and
(3) the extraction of energy from waves and tides – consequences for ecosystems.

Butterworth advised that a World Conference on Stock Assessment Methods for Sustainable Fisheries will be held from 16-18 July 2013, in Boston, USA with Steve Cadrin, Mark Dickey-Collas and Rick Methot as Conveners, as part of the ICES SISAM initiative. A Scientific Steering Group (including Butterworth of the IWC Scientific Committee), linked to SISAM, has been set up to assist the Conveners in planning the Symposium.

The symposium will be structured with presentation sessions, participatory workshops and open floor discussion groups. Further information can be found at *http://ices.dk/iceswork/symposia/wcsam.asp*.

The Committee thanked Haug for the report and **agrees** that he should represent the Committee as an observer at the next ICES meeting.

4.3 Inter-American Tropical Tuna Commission (IATTC)
The report of the observer at the 82nd meeting of the IATTC held La Jolla, USA 4-8 July 2011 is given as IWC/64/4C. The Antigua Convention came into force on 27 August 2010 and under this the IATTC is expected to give greater consideration to non-target and associated species, including cetaceans, in taking management decisions. A summary of ongoing work describing what is known about the direct impact of the fisheries on other species in the ecosystem and the environment. This ongoing work will shape future directions of AIDCP (see Item 4.4) and IATTC measures aimed at managing fisheries and conserving dolphins.

The Committee thanked Rusin for attending on its behalf and **agrees** that he should represent the Committee as an observer at the next AIDCP meeting.

4.4 Agreement on the International Dolphin Conservation Program (AIDCP)
The report of the observer at the 24th Meeting of Parties to the AIDCP held in La Jolla, USA on 21 October 2011 is given as IWC/64/4C. The AIDCP mandates 100% coverage by observers of fishing trips by purse seiners of carrying capacity greater than 363t in the agreement area and in 2011 all trips by such vessels were sampled by independent observers.

The overall dolphin mortality limit (DML) for the international fleet in 2011 was 5,000 animals and the unreserved portion of 4,900 was allocated to 86 qualified vessels that requested DMLs. In 2010 no vessel exceeded its DML. The number of sets on dolphin associated schools of tuna made by vessels over 363t has been increasing in recent years, from 9,246 in 2008 to 10,910 in 2009 to 11,645 in 2010, however fewer were made in 2011 – 9,604. This type of set accounted for 44% of the total number of purse-seine sets made in the ETP in 2011. While fewer dolphin sets were made in 2011, this remains a frequent practice and the predominant method for catching yellowfin tuna by purse-seine in the ETP. Assessment surveys scheduled for 2009 and 2010 have been delayed so it is unclear when abundance estimates for cetaceans in the ETP will be available to update the 2006 survey data.

The Committee thanked Rusin for attending on its behalf and **agrees** that he should represent the Scientific Committee as an observer at the next AIDCP meeting.

4.5 International Commission for the Conservation of Atlantic Tunas (ICCAT)
No observer for the IWC attended the 2011 meeting of ICCAT.

4.6 Convention for the Conservation of Antarctic Marine Living Resources (CCAMLR)
The report of the IWC observer at the 30th Meeting of the CCAMLR Scientific Committee (CCAMLR-SC), held in Hobart, Australia from 23-27 October 2011 is given as IWC/64/4J. The main items considered at the CCAMLR meeting of relevance to the IWC included: (1) fishery status and trends of Antarctic fish stocks, krill, squid and stone crabs; (2) incidental mortality of seabirds and marine mammals in fisheries in the CCAMLR Convention Area; (3) harvested species; (4) ecosystem monitoring and management; (5) management under conditions of uncertainty about stock size and sustainable yield; (6) scientific research exemption; (7) CCAMLR Scheme of International Scientific Observation; (8) new and exploratory fisheries; (9) joint CCAMLR-IWC Workshop with respect to ecosystem modelling in the Southern Ocean; and (10) the CCAMLR performance review.

The publication status of documents from the 2008 joint CCAMLR-IWC Workshop on ecosystem modelling was discussed. Almost all expert groups have completed their review papers. The review process for the papers, which will be published in either *CCAMLR Science* or the *Journal of Cetacean Research and Management*, will begin soon.

MPAs were discussed in detail. The area of the southern South Orkney shelf and the Seasonal Pack-ice Zone and part of the Fast Ice Zone south of the shelf was the first MPA designated by CCAMLR. The following milestones were previously agreed:

(1) by 2010, collate relevant data for as many of the 11 priority regions as possible;
(2) by early 2011, convene a workshop to review progress, share experience and determine a work programme for the identification of MPAs;
(3) by 2011 identify candidate areas for protection in as many priority regions as possible;
(4) by 2011, submit proposals for areas for protection to the CCAMLR-SC; and
(5) by 2012 submit proposals on a representative system of MPAs to the CCAMLR Commission.

The Committee thanked Kock for attending on its behalf and **agrees** that he should represent the Committee as an observer at the next CCAMLR-SC meeting. In addition, Butterworth will act as an observer at meetings of the WG-EMM.

4.7 Southern Ocean GLOBEC (SO-GLOBEC)
The synthesis and analysis process under SO-GLOBEC has continued and has produced a number of papers relating cetacean distribution to prey and other environmental variables. There is no active work with respect to SO-GLOBEC at this time.

4.8 North Atlantic Marine Mammal Commission (NAMMCO)
4.8.1 Scientific Committee
The report of the IWC observer at the 18th meeting of the NAMMCO Scientific Committee (NAMMCO SC) held in Gjógv, Faroe Islands from 2-5 May 2011 is given as IWC/64/4I. The ICES-NAMMCO workshop on bycatch monitoring reviewed indirect and direct bycatch monitoring, data collection and fleet data needed for raising estimates to fleet level. It was noted that bycatch numbers could be high both in Norway and Iceland. The NAMMCO SC strongly encouraged Norway, Iceland and the Faroes to proceed with the implementation of their bycatch monitoring systems. The NAMMCO SC reiterated its recommendation to Greenland to investigate the degree to which bycatch is reported as catch.

Extensive biological sampling was conducted by Iceland from all fin whales landed in 2010. Analysis of all samples is complete and a DNA registry has been initiated.

The 2007 abundance estimates for humpback whales for all areas have now been provided to, reviewed and endorsed by the NAMMCO SC. For the first time since 1986 there was a quota for humpback whales in West Greenland and all nine whales were caught. The NAMMCO SC recommended eye sampling of the whales for age determinations, as well as tail photographs.

Corrected estimates for minke whales for the 2007 and 2009 Icelandic aerial surveys were endorsed. The best available estimate of abundance for 2007 was 48% of that for 2001. Abundance in 2009 remains the lowest yet seen in all areas. The NAMMCO SC agreed that the new evidence presented strengthened the conclusion that the observed decline in abundance was not a result of error in measuring or analyses.

A conventional distance sampling abundance estimate of pilot whales for the Iceland-Faroes shipboard area was endorsed by the NAMMCO SC. They noted the difficulties in providing abundance estimates appropriate for management of this species given the absence of adequate data.

Observations of bowhead whales around Svalbard, Norway from 1940-2009 show an increase in abundance in the last decade. This could be due to an increase in the numbers of whales or increased tourism and a dedicated reporting system. An acoustic study that will continue through 2012 has shown that bowhead whales are present in the Fram Strait throughout the winter and generally during most of the year. A satellite tracked whale from the Spitsbergen stock moved from the so-called northern whaling ground to the southern whaling ground during summer and then back north again during winter. This is opposite of the general seasonal movement patterns for other bowhead whale stocks, but in accordance with reports from whalers in previous centuries.

An aerial survey in West Greenland was scheduled for spring 2012. The primary targets were planned to be narwhals and white whales, with bowhead whales and walruses secondary targets.

The Committee thanked Walløe for attending on its behalf and **agrees** that he should represent the Committee as an observer at the next NAMMCO SC meeting.

4.8.2 Council

The report of the IWC observer at the 20th Annual Meeting of NAMMCO held in Oslo, Norway in September 2011 is given as IWC/64/4B. All requested stock assessments for large whale species in the North Atlantic have now been finalised based on sightings data from the Trans North Atlantic Cetacean Sightings Surveys (T-NASS) in 2007 and additionally in 2009. Management procedures applied have been derived from those already developed by the Scientific Committee of the IWC using the Revised Management Procedure (RMP) approach. An RMP-like approach has been recommended by the Scientific Committee of NAMMCO for some large whale stocks in their discussions on general models to be adopted by NAMMCO. These stock assessments by the constitute the main basis for catch limits set for some baleen whale stocks (fin and minke whales) in the North Atlantic.

Based on T-NASS data, an updated abundance estimate for pilot whales has been made in the areas surveyed in 2007. Although the combined area represented is small and not directly comparable with previous surveys, the available information gives no reason to amend previous conclusions on the sustainability of the Faroese catch. The next regular NASS is scheduled to take place between 2013 and 2015 and planning is already under way.

The working group on marine mammal/fisheries interactions continued its work on development of a large international ecosystem modelling project. A network has been established between several leading scientists in this field aimed at securing funding for the project which includes applying four different modelling approaches to two data rich areas, the Barents Sea and Icelandic coastal waters.

A training course for observers appointed under the NAMMCO joint control scheme for the hunting of marine mammals is to be organised this year.

The Committee thanked Katsuyama for attending on its behalf and **agrees** that he should represent the Committee as an observer at the next NAMMCO Council meeting. Further information on NAMMCO can be found on their website[1].

4.9 International Union for the Conservation of Nature (IUCN)

Cooke and Reeves, the IWC observers, reported on the considerable cooperation with IUCN that had occurred during the past year and this is given as IWC/64/4K.

Western gray whales

The mandate of the IUCN Western Gray Whale Advisory Panel (WGWAP) has been renewed for a further five years, under the aegis of the IUCN Global Marine and Polar Programme. The Panel has expressed concerns about plans to install a third offshore platform for oil and gas extraction just offshore of the gray whale feeding ground, but this project has now been postponed. Analyses of the data collected during a 2010 seismic survey with respect of the effects on gray whales and the effectiveness of mitigation measures are still in progress. Similar mitigation and data collection arrangements are in place for a smaller seismic survey that is currently underway and further information is given in Annex F, Appendix 9. The work of WGWAP is discussed further under Item 10.4.2.

Red List updates

A current list of all cetacean species and populations that have been assessed for the Red List, and their current Red List classification, is maintained on the Cetacean Specialist Group website[2] with links to the assessments which are held on the Red List website (*http://www.redlist.org*). Updates since the last Annual Meeting include separate assessments for the two recently recognied species of finless porpoises (*Neophocaena asiaeorientalis* and *N. phocaenoides*), both listed as Vulnerable. New assessments are underway for the dolphins in the genus *Inia*, which were recently split into two species, *Inia geoffrensis*, the Amazon River dolphin, and *I. boliviensis*, the Bolivian bufeo.

Cetacean Specialist Group

The website of the IUCN Cetacean Specialist Group (*http://www.iucn-csg.org*), contains regular updates of IUCN's cetacean-related activities and other work in which group members are involved. New items since last year relate to vaquita conservation efforts, Mekong River dolphins in Cambodia, Indus dolphins in Pakistan, new cetacean protected areas in Bangladesh.

World Conservation Congress

The IUCN 4-yearly World Conservation Congress will be held 6-15 September 2012 in Jeju, Korea with the theme 'Nature+'. The programme includes three cetacean-related events: a workshop on lessons learned from the IUCN western gray whale conservation initiative; a presentation on a local population of Indo-Pacific bottlenose dolphins found around Jeju Island; and a workshop on cetacean conservation and whale-watching in Africa[3].

The Committee thanked Cooke and Reeves for their report. It also thanked Larsen who has now left the IUCN,

[1]*http://www.nammco.no.*
[2]*http://www.iucn-csg.org/index.php/status-of-the-worlds-cetaceans.*
[3]*http://www.worldconservationcongress.org.*

for his contributions in the past and **agrees** that Cooke should continue to act as observer to IUCN for the IWC.

4.10 Food and Agriculture Organisation (FAO) related meetings – Committee on Fisheries (COFI)
No observer for the IWC attended the 2011 meeting of COFI.

4.11 Convention on International Trade in Endangered Species of Wild Flora and Fauna (CITES)
No observer for the IWC attended the 2011 meeting of CITES.

4.12 North Pacific Marine Science Organisation (PICES)[4]
The report of the IWC observer at the 20th annual meeting of PICES held 14-23 October 2011 in Khabarovsk, Russia is given as IWC/64/4H. The Marine Birds and Mammals Advisory Group (AP-MBM) recommended that PICES request the IWC Scientific Committee includes a seabird observer on the IWC-POWER cruise survey vessel in the future.

Spatial ecology and conservation was selected as the basis of the new activity plan for the AP-MBM. The objectives are:
(1) synthesise distribution data on marine birds and mammals and its temporal change in the North Pacific;
(2) examine the physical and biological factors that correspond to the distribution and abundance of marine birds and mammals and their economic/ecological hot spots; and
(3) provide information on ecological areas in the PICES regions to aid understanding and sustainable use of marine resources.

Two sessions at the 2012 AP-MBM workshop were of relevance to the IWC, these were: (1) environmental contaminants in marine ecosystems: seabirds and marine mammals as sentinels of ecosystem health; and (2) the feasibility of updating prey consumption by marine birds, marine mammals and large predatory fish in PICES regions.

The Committee thanked Kato for attending on its behalf and **agrees** that he should represent the Committee as an observer at the next PICES meeting.

4.13 Eastern Caribbean Cetacean Commission (ECCO)
No information on the activities of ECCO was provided.

4.14 Protocol on Specially Protected Areas and Wildlife (SPAW) of the Cartagena Convention for the Wider Caribbean[5]
The report of the IWC observer to SPAW is given as IWC/64/4D. The MSP LifeWeb Project was launched in October 2010, which aims to assist with the implementation of decisions from the Convention on Biological Diversity, as well as those of the Cartagena Convention and its SPAW protocol. Recent activities under this project include:
(1) a workshop on integration, mapping and GIS analysis of marine mammal migration routes, critical habitats and human threats in the wider Caribbean region (May 2011);
(2) assisting in the coordination of a conference on Marine Mammal Protected Areas (November 2011);
(3) identifying marine mammal data sources within the wider Caribbean region and collating information in an online database;
(4) a workshop on broad-scale marine spatial planning (March 2012);
(5) analysis of identified marine mammal data in order to develop data layers and maps on the critical habitats for marine mammals in the wider Caribbean; and
(6) a workshop on broad-scale marine spatial planning and transboundary marine mammal management (May 2012).

In 2011 a project focusing on marine mammal watching was implemented. It aims to improve and centralise the level of information and knowledge on the status, distribution and threats of marine mammals in the region. A related workshop was held in October 2011. The Committee thanked Carlson for attending on its behalf and **agrees** that she should represent the Committee as an observer at the next SPAW meeting.

4.15 Indian Ocean Commission (IOC)[6]
No information on the activities of IOC was provided.

4.16 Permanent Commission for the South Pacific (CPPS)[7]
No information on the activities of CPPS was provided.

4.17 International Maritime Organisation (IMO)[8]
The report of the IWC observer to the IMO is given as IWC/64/4G. The IWC has contributed to IMO discussions on addressing ship strikes and the impacts of underwater noise from shipping. The IMO has established a correspondence group to develop non-mandatory draft guidelines for reducing underwater noise from commercial ships (Donovan is a member of this group). This group will report to the IMO's 57th session of the sub-committee on ship design and equipment in early 2013.

The IMO is also working to develop a mandatory Polar Code to control the expected increase in ship traffic in polar waters (the Arctic and the Antarctic) that results from climate and other changes. The Polar Code is intended to function alongside existing IMO conventions and to augment existing measures to reduce the environmental impacts of shipping taking into account the greater environmental sensitivity of polar waters. An IMO Workshop on Environmental Aspects of the Polar Code was held in Cambridge in September 2011 where there was considerable discussion of ship strikes and underwater noise impacts on whales. The Polar Code work is also co-ordinated by the IMO sub-committee on ship design and equipment.

The Committee thanked Leaper for his report and **agrees** that the IWC Secretariat should represent the Committee at the next IMO meeting.

4.18 Conservation in the southeastern Pacific under the framework for the Lima Convention
No information on conservation in the southeastern Pacific under the framework for the Lima Convention was provided.

4.19 International Committee on Marine Protected Areas (ICMMPA)[9]
At its 60th Annual Meeting in Santiago, Chile, the Committee endorsed support for the first International Conference on Marine Mammal Protected Areas (MPAs), which was

[4] *http://www.pices.int*.
[5] *http://www.cep.unep.org/cartagena-convention*.
[6] *http://www.coi-ioc.org*.
[7] *http://www.cpps-int.org*.
[8] *http://www.imo.org*.
[9] *http://www.icmmpa.org*.

subsequently held in Hawaii in 2009. The committee that organised the conference is now a task force of the IUCN. It hopes to continue its constructive relationship with the IWC and SC/64/O1 is the summary report of the second (ICMMPA) meeting. The meeting was held in Martinique in the French Caribbean from 7-11 November 2011. The aim was to seek solutions to shared problems related to marine mammal conservation and to MMPA network and site design, creation and management. A secondary aim was to orient those working in MMPAs to set those protected areas in the broader context of marine management.

The conference theme was 'Endangered Spaces, Endangered Species' and workshops focused on monk seals, sirenians, river dolphins and other small and large cetaceans; special attention was given to the vaquita, the most endangered, space-restricted marine mammal in the world. Plenary sessions focused on:

(1) special considerations for particularly endangered marine mammals and whether MPAs are the right tool;
(2) refining understanding of marine mammal critical habitat and hotspots to inform MMPA designation;
(3) using marine spatial planning and ecosystem-based management to address broad threats to marine mammals;
(4) managing MMPAs for localised threats and mitigation by spatial protection and other means;
(5) development of MMPAs in the wider Caribbean region; and
(6) regional cooperation for MMPA scientific and technical networking.

The workshops focused on marine mammals and oil spills, decision-making with limited data, best practices for whale watching in MMPAs, integrating marine mammal data in marine spatial planning, forging agreements to establish effective MMPA networks, and the widespread mortality attributed to fisheries bycatch.

Proceedings of this second ICMMPA meeting will be available and released shortly and a third ICMMPA meeting is planned to be held in about two years' time. A proposal was received from Australian scientists and decisions on exact location and date are yet to be taken.

5. REVISED MANAGEMENT PROCEDURE (RMP) – GENERAL ISSUES

5.1 Complete the MSY rates review

Since 2007, the Committee has been discussing maximum sustainable yield rate (MSYR) in the context of a general reconsideration of the plausible range to be used in population models used for testing the *Catch Limit Algorithm* (*CLA*) of the RMP (IWC, 2008g; 2009b; 2010c; 2010i; 2011m). The current range is 1% to 7%, in terms of the mature component of the population. As part of its review, the Committee has been considering observed population growth rates at low population sizes. An important issue raised (Cooke, 2007) was that should variability and/or temporal autocorrelation in the effects of environmental variability on population growth rates be high, simple use of such observed population growth rates could lead to incorrect inferences being drawn over the lower end of the range of plausible values. In 2010, the Committee agreed a Bayesian approach (Punt, 2010) for calculating a probability distribution for the rate of increase for an 'unknown' stock in the limit of zero population size, once the inputs needed to apply it become available (IWC, 2011g).

Last year, the Committee had agreed that the review would be completed at this meeting (IWC, 2012f). However, given effectively no intersessional progress, the issue was furthered but not completed during the present meeting (Annex D, Appendix 2) as follows:

(1) values of demographic parameters to be used for the calculation of the CV and autocorrelation of the rate of increase were agreed for the 15 populations for which estimates of growth rate at low population size were available if it is assumed that only fecundity is stochastic;
(2) calculations were undertaken for the case where there is no variability in survival rate; and
(3) progress was made on the implementation of two approaches for specifying variability in survival rate; one which results in the same CV for the rate of increase for variability in survival rate as the CV implied by the variability in fecundity, and another which is based on an approach involving optimal allocation of energy between reproduction and survival.

The Committee expressed serious concern that once again the process has not been completed and it carefully examined whether it was worth continuing the process. However, given the good progress during the meeting, and the work plan developed (Annex D, item 2.1), the Committee **agrees** that no more than one further year would be allowed for this process. If the MSYR review cannot be completed at next year's meeting, the current range of MSYR rates (1% - 7% in terms of the mature component of the population) will be retained.

To ensure completion of these tasks, a three-day intersessional meeting is required, with at least five participants, ideally back-to-back with another intersessional meeting. An intersessional Steering Group, under Butterworth (Annex Q1), was appointed to co-ordinate the meeting and associated preparation. Any models related to variability in survival rate to be considered must be fully specified to the Steering Group at least one month before the intersessional meeting. The financial considerations are given under Item 23.

5.2 Finalise the approach for evaluating proposed amendments to the *CLA*

The Committee last discussed this issue in 2006 (IWC, 2007c) noting that it was originally intended that this work would occur in conjunction with the completion of the MSYR review (see Item 5.1 above). The Committee re-established a Working Group under Allison (Annex Q2) to develop trials to examine the effects of possible environmental degradation in terms of trials in which *K*, and perhaps MSYR, varies over time.

The Committee **stresses** that this work must be completed by the next Annual Meeting irrespective of the progress made under Item 5.1.

5.3 Evaluate the Norwegian proposal for amending the *CLA*

The Committee was unable to complete its evaluation of the Norwegian proposal given the discussions under Items 5.1 and 5.2 above. The Committee **agrees** that this task will be completed at the next Annual Meeting either using the revised values from the MSYR review or the existing values if the review is not completed.

5.4 Modify the 'CatchLimit' program to allow variance-covariance matrices

The 'CatchLimit' program implements the *CLA* and now allows variance-covariance matrices for the abundance estimates to be specified (IWC, 2012f). Allison noted that it includes some non-standard coding statements and she will be working with the Norwegian Computing Center during the intersessional period to develop a final version of the program.

5.5 Update the Requirements and Guidelines for Conducting Surveys and *Implementations*

The Committee's Requirements and Guidelines for Conducting Surveys and Analysing Data within the Revised Management Scheme (IWC, 2012x) were written when only design-based surveys were realistic. Subsequently, spatial modelling approaches have been developed as an additional realistic approach. In addition, many [quasi] design-based surveys do not formally meet design-based criteria, and there may be a question regarding on the adequacy of resultant estimates. The Committee has frequently considered model-based and quasi-design-based estimates (e.g. IDCR/SOWER and SCANS), but without explicit criteria and not necessarily in the context of the RMP. Two linked issues therefore arise: under what circumstances might approval from the Scientific Committee reasonably be given to surveys that are not design-based; and should the Guidelines should be amended to give more specific advice on the considerations for evaluating model-based estimates (including extrapolations) and/or quasi-design-based estimates.

The statistical issues involved are complex, both theoretically and in practice. A number of detailed starting points for discussion are noted in Annex D, item 2.5, and sufficient experience with model-based methods has now accumulated to warrant a review. The Committee, also recognising the importance of this work for all sub-committees that consider abundance estimates in a conservation and management context, therefore **recommends** that such a review (covering model-based abundance estimation in theory and practice, and its relation to the design-based approach), be conducted. The review (Annex D, Appendix 4) will also provide draft text for inclusion in the Committee's Requirements and Guidelines for Conducting Surveys document. The financial considerations are given under Item 23.

5.6 Evaluate the optimisation method used when conditioning trials

Punt and Elvarsson (2011) developed and compared a number of ways to improve the performance of the optimisation algorithm underlying the conditioning process, as discussed in Annex D, item 2.6. The Committee noted that the optimisation scheme used for conditioning the trials for the western North Pacific minke whales had been modified accordingly.

5.7 List of abundance estimates and their recommended uses

The list of accepted abundance estimates for those stocks that have been subject to RMP *Implementations* (and *Reviews*) are provided in Annex D, Appendix 2 along with references to discussions as to whether they are acceptable for use in conditioning, acceptable for use in trials and/or acceptable for use in applications of the *CLA*. The only exception was for western North Pacific common minke whales where evaluation is ongoing (see Item 6.3).

5.8 Work plan

The Committee's views on the work plan developed by the sub-committee on the RMP are given under Item 21 and financial matters are considered under Item 23.

6. RMP – PREPARATIONS FOR *IMPLEMENTATION*

6.1 Western North Pacific Bryde's whales

6.1.1 Prepare for 2013 Implementation Review

The Committee was informed that Japan wished to postpone the 2013 *Implementation Review* for North Pacific Bryde's whales until 2016 because:

(1) dedicated sighting surveys have been conducted in the western North Pacific since 2010 and additional surveys targeted towards Bryde's whales were planned for 2012 and beyond;
(2) lower latitudinal waters in the eastern North Pacific will be covered during the IWC-POWER research programme during 2013-15;
(3) there are currently no genetic samples for sub-area 2 (east of 180°). It is expected that biopsy samples will be collected from Bryde's whales during the IWC-POWER research programme; and
(4) new genetic samples have been obtained for sub-area 1 (west of 180°) during JARPN II as well as other sources, but the data have yet to be analysed.

6.1.2 Recommendations

Implementation Reviews should normally be scheduled not later than six years after the completion of the previous *Implementation* (or *Review*) (IWC, 2012y). The western North Pacific Bryde's whale *Implementation* was completed in 2007 (IWC, 2008f). However, the Committee **recommends** that the *Implementation Review* for western North Pacific Bryde's whales be delayed until 2016 given:

(1) the *Implementation* completed in 2007 considered a range of hypotheses related to stock structure and productivity;
(2) three more years of catches are unlikely to lead to conservation concerns given the results of the *Implementation*;
(3) that it cannot conduct more than one *Implementation Review* at a time (see Items 6.2 and 6.3 below); and
(4) a delay would allow additional sightings and genetics data to become available.

6.2 North Atlantic fin whales

In 2009, the Committee agreed (IWC, 2010e) that if the RMP is implemented for North Atlantic fin whales, certain variants (see table 4 of IWC, 2010e, p.122) could be implemented without a research programme. It also agreed that another variant would be acceptable only with an agreed research programme for the reasons given in IWC (2010e). A primary aspect of this related to whether or not a particular stock hypothesis, 'hypothesis IV', was appropriate.

SC/64/RMP3 responded to a recommendation from the Committee last year that further analysis of the Discovery marking data should be carried out within the framework of the *Implementation Simulation Trials* as detailed in Annex D, item 3.2. The Committee noted that SC/64/RMP3 provided evidence suggesting that stock structure hypothesis IV is inconsistent with existing data but recognised that making a final decision on its acceptability could also involve additional trials. This can best be achieved within the context of an *Implementation Review*.

Annex D, table 1 summarises new information available for an *Implementation Review*. The Committee **agrees** that the available information is sufficient to warrant an *Implementation Review* in 2013. It noted that while the *Implementation Review* would be focused on providing advice for the Icelandic hunt, the discussions of stock structure would also be valuable in the context of the SWG's work to develop an *SLA* for the aboriginal hunt off West Greenland (Annex E).

6.2.1 Recommendations

The Committee **recommends** that the *Implementation Review* for the North Atlantic fin whales be brought forward to 2013. The *Review* should start during a pre-meeting immediately before the 2013 Annual Meeting to ensure that it is completed in one year. An intersessional email Steering Group (Annex Q3) was established to coordinate the work prior to the 2013 meeting.

6.3 North Pacific common minke whales (continue *Implementation*)

The Committee is conducting an *Implementation Review* for western North Pacific common minke whales and is following the schedule set out in its Requirements and Guidelines (IWC, 2012i). At last year's meeting, the Committee had been unable to complete the tasks required for the First Annual Meeting, primarily because it had not been possible to complete conditioning of the *Implementation Simulation Trials*, a major task given their complexity. This meant that the two year schedule for the *Implementation Review* had been disrupted.

This year's meeting was effectively a repeat of the First Annual Meeting with the same list of tasks that had been initiated last year. There had been another intersessional Workshop in December 2011 to facilitate the work necessary to ensure that all relevant tasks could be completed at this year's meeting as described under Item 6.3.1.

6.3.1 Report of the December 2012 Intersessional Workshop

Donovan presented a summary of the report of the Intersessional Workshop held 12-16 December 2012, kindly hosted by the Government of Japan (SC/64/Rep2). The primary objective of the Workshop was to ensure completion of the conditioning of trials in time for the 2012 Annual Meeting, although a number of other topics were addressed to assist the Committee in its work to complete the *Implementation Review*. Conditioning is the process of selecting the values for the parameters of the operating models that implement the trials such that the predictions from these models are consistent with the available data.

The Intersessional Workshop covered issues relating to: stock structure and mixing matrices; conditioning; abundance estimates for use in trials; specification of these trials; plausibility of stock structure hypotheses; and data/analyses to reduce the number of stock structure hypotheses in future *Implementations*. Considerable progress was made and details are given in Annex D1, item 3 and SC/64/Rep2.

6.3.2 Conditioning

Following the Intersessional Workshop, a number of problems with the fits of the operating model to the data had been identified. Suggested changes to the trial specifications were developed, details of which are given in Annex D1, item 4.1, which the Committee **endorses**.

The Committee reviewed the results for the six baseline trials (stock structure hypotheses A, B and C with MSY rates of 1% and 4%) given in Annex D1, Appendix 2 and **agrees** that the conditioning for these trials had been acceptably achieved. There was insufficient time to evaluate the results of the conditioning of all the sensitivity tests. However the Committee **agrees** that the results for trials for which 100 simulations were available suggested that it is possible to determine whether conditioning has been achieved successfully based on the fit of the operating model to the actual data.

The Committee received a summary report from a small group appointed to review the results of trials run to date. Allison reported that all trials for stock structure hypotheses A and C with MSYR=1% had now been run with the actual data. Conditioning had been achieved for all these trials except two, for which the mixing matrices needed adjustment. Based on these results and on extensive past experience with reviewing the results of such trials, the Committee **agrees** that conditioning of the *Implementation Simulation Trials* of western North Pacific common minke whales had been acceptably achieved.

6.3.3 Update to standard datasets - abundance estimates

Abundance estimates play three roles in the *Implementation* process: (1) for use in conditioning trials; (2) for use when applying the *CLA* during *Implementation Simulation Trials*; and (3) for actual application of the *CLA*. The abundance estimates for use during conditioning were selected during the First Intersessional Workshop in December 2010 (IWC, 2012d). At this meeting, the Committee needed to select which abundance estimates to use when applying the *CLA* during *Implementation Simulation Trials*. The abundance estimates for use in actual application of the *CLA* will be finalised next year.

The Committee received a cruise report of a sightings survey in the Yellow Sea in May 2011 (SC/64/NPM6) and an estimate of abundance for minke whales from this survey (SC/64/NPM7); details are given in Annex D1, item 5.1.1. The Committee expressed its appreciation to the Government of Korea for its continued commitment to surveys for minke whales in Korean waters and to An for his role of oversight on behalf of the Committee. In discussion, the Committee raised a number of issues with the analysis that requires further work. Therefore this estimate was not accepted for use in *Implementation* of the RMP at this meeting but the Committee looks forward to the presentation of a revised estimate in the future.

The Committee received SC/64/NPM2, an updated summary of the information on survey procedures for the Japanese dedicated sighting surveys conducted by the Institute of Cetacean Research (ICR) and the National Research Institute of Far Seas Fisheries (NRIFSF), in response to a recommendation from the December 2011 Intersessional Workshop (SC/64/Rep2). The authors concluded that sighting procedures for the ICR surveys follow the RMP Requirements and Guidelines for Surveys, except that the surveys were not subject to Committee oversight, and that the survey procedures for the NRIFSF surveys met all the Requirements and Guidelines. The Committee also received SC/64/NPM3, which presented abundance estimates from JARPN II (see Item 17) sightings data for minke whales in sub-areas 7CS, 7CN, 7WR, 7E, 8 and 9 collected during 2008 and 2009. Details are given in Annex D1, item 5.1.2.

A number of issues were raised and discussed relating to survey design, survey direction relative to migration, survey protocol for responding to bad weather and achieved coverage; details are given in Annex D1, item 5.1.2. One specific point was that the estimates of abundance for 2008 and 2009 use information from other years. The Committee therefore **recommends** that variance-covariance matrices be computed for the entire time-series of abundance estimates for sub-areas 7CS, 7CN, 8, and 9.

Whether and how to use estimates with low coverage or design concerns and the treatment of JARPN and JARPN II surveys (i.e. surveys that had not originally been intended to produce estimates for use in the RMP) that did not have Committee oversight raised issues beyond the specifics of the *Implementation Review* of western North Pacific minke whales. Accordingly, the Committee had a general discussion of these issues, the report of which is given under Item 5.8.

In light of that discussion, a small group reviewed all of the available abundance estimates to determine whether or not they were acceptable for use when applying the *CLA* during *Implementation Simulation Trials*. Each available estimate was categorised as 'Yes', 'No', 'No agreement', and 'Yes*' (see Annex D1, Appendix 3). The category Yes* indicates that they can be used in the trials but that further analysis needs to be considered for the estimate to become acceptable for application of the RMP. Surveys which had been accepted for use in the trials during the 2003 *Implementation* were automatically deemed acceptable. The Committee **endorses** the categorisations given in Annex D1, Appendix 3.

Regarding those estimates for which no agreement had been reached on whether or not they were acceptable for use in trials, the Committee **agrees** that the baseline trials should be conducted for the least and most aggressive RMP variants both using and not using the 'No agreement' estimates when applying the *CLA*. If the results of the trials are sensitive to the inclusion of the 'No agreement' estimates, the proponents would be requested to justify how the 'No agreement' estimates could become acceptable with further analysis. The final decision on whether further analysis is likely to allow 'No agreement' estimates to be acceptable will be made by the Intersessional Steering Group established under Butterworth (Annex Q10).

Annotation 21A to the RMP specifications (IWC, 2012y) states that 'A part of an *Area* which is unsurveyed in a single year may count as surveyed when the data from several years are combined, provided that an appropriate multi-year regression analysis is used, and additional variance is taken into account'. In response to a recommendation in SC/64/Rep2, the Committee received SC/64/NPM5, which extrapolated abundance estimates to parts of sub-areas 8, 11, and 12NE which were not covered during some past surveys, to eliminate the bias in estimated abundance trend which arises due to variable coverage. Details are given in Annex D1, item 5.1.2.

The Committee noted that blocks B11-2 and B12NE-2 had only been surveyed once which meant that there are insufficient data to inform additional variance. The Committee **agrees** that the information for sub-area 8 satisfied the requirements for applying annotation 21A.

6.3.4 Update to standard datasets – best catch series

The Committee **agrees** with the recommendation in Annex D of SC/64/Rep2 that the 'Best' catch series was appropriate for the direct catches.

The Committee noted that a single series of bycatches would be used for all of the trials when applying the RMP, irrespective of the true values for the bycatches, which differ among trials, and simulations within trials. The Committee **agrees** that the bycatches would be set to the averages of the predicted bycatches based on the fit to the actual data of the operating model for the six baseline trials (see Annex D1, Appendix 4).

Regarding the specification of future bycatches in the trials, the Committee **agrees** that this should be achieved by assuming that the bycatch rate in the future equals the bycatch rate estimated for the trial in question averaged over the previous five years (Annex D1, Appendix 9).

6.3.5 Final consideration of plausibility

A key step in the Committee's Requirements and Guidelines for *Implementations* (IWC, 2012y) is assigning plausibility to hypotheses and, by extension, to all of the *Implementation Simulation Trials*. Trials are assigned 'low', 'medium' or 'high' weights, or are categorised as 'no agreement', which are treated as 'medium' weighted trials. Trials with 'low' weights are not considered further in the *Implementation*.

When the results of the trials are examined, for each management variant (see Item 6.3.5.1), 'acceptable' conservation performance is required for all 'high' weight trials but 'borderline' or 'unacceptable' conservation performance for a number of 'medium' weight trials, leads to further consideration of a possible 'with research' option, as detailed in IWC (2012y). Unacceptable performance of a management variant in any 'high' weight trial leads to that variant being eliminated from further consideration, including with respect to the 'with research' option.

The schedule for *Implementations* in the Committee's Requirements and Guidelines for *Implementations* (IWC, 2012y) required final decisions on the plausibility of hypotheses to be made at this year's meeting.

SC/64/Rep2 noted that the present meeting would decide whether analyses of CPUE data (or sighting per unit effort data, SPUE) could be used qualitatively to inform assignment of plausibility weights to the hypotheses (stock structure and MSYR) on which the trials are based (see Annex D1, item 3.6). The Workshop had noted that a document outlining relevant operational factors needed to be developed for the Committee to make a decision in this regard, and it had made a number of recommendations regarding such a document.

SC/64/NPM4 summarised information pertaining to catch, sightings and effort data from Japanese small-type whaling during 1977-87 in relation to minke whales. The authors concluded that CPUE or SPUE data can be useful as an index of population trend if standardised.

The Committee thanked the authors of SC/64/NPM4, which covered most of the factors identified. It noted that there was considerable variation in where individual vessels operated during the year, and that if vessel movement reflects availability of whales, CPUE or SPUE may be biased as an index of relative abundance. It was suggested that focusing on April-May only may provide more consistency.

Following the presentation of the results of additional analyses, the Committee considered that further analysis and model diagnostics would need to be provided before the resultant SPUE trends could be used to assist the assignment of plausibility to hypotheses related to stock structure and MSYR. Given the time available, this was not feasible this year. It was noted that these data could be re-analysed and presented to the next *Implementation Review*, although some members considered that use of whaling SPUE data was inherently problematic and that no analyses of these data would lead to information which could inform plausibility.

6.3.5.1 STOCK STRUCTURE

In response to a request made intersessionally, the Committee received papers from the proponents of Hypotheses A/B

(SC/64/NPM1) and of Hypothesis C (SC/64/NPM11) summarising their main features and supporting evidence. Details of these papers are given in Annex D1, item 6.2. A graphical representation of these stock structure hypotheses is given in fig.1 of IWC (2012h, p.103).

Two papers containing new genetic analyses were presented. SC/64/NPM9 used computer simulations to examine the effect of different sample sizes on the distributions of the correlations between θ and F_{IS}, following an analysis presented last year (Waples, 2011) in which it was proposed that, in a sample that contains individuals only from two distinct stocks, the largest departures from equilibrium (quantified as F_{IS}) should be seen at the loci that show the largest allele frequency differences between the two stocks (quantified as θ). Details are given in Annex D1, item 6.2. given the considerable variability seen in the simulated data, the authors of SC/64/NPM9 suggested that further evaluation is required before the results of (Waples, 2011) could be used as evidence against Hypotheses A and B.

In discussion, it was suggested that it would be useful to extend these analyses to the two-locus (linkage disequilibrium - LD) correlations that were also reported in (Waples, 2011). Additional discussion is given in Annex D1, item 6.2.

SC/64/NPM10 responded to a request from last year's meeting for follow-up analyses comparing the performance of two Bayesian clustering programs (STRUCTURE and HWLER) for detecting the number of gene pools represented in a sample. Details are given in Annex D1, item 6.2. Both programs only detected one population when true panmixia was modelled, but both also failed to detect a second population at the weakest level of differentiation (F_{ST} = 0.007). STRUCTURE reliably detected two populations at F_{ST} = 0.02 but HWLER did not, but HWLER was more consistent in resolving mixtures for F_{ST} > 0.03.

In discussion, the Committee noted that the results provide additional confirmation that these Bayesian clustering methods cannot detect the weakest levels of population structure, at least using currently available numbers of genetic markers. Details of additional discussion are given in Annex D1, item 6.2. Several more technical aspects of the performance of STRUCTURE at moderate levels of population differentiation (F_{ST} = 0.045-0.06) were also discussed; details are given in Annex I.

In response to a request in SC/64/Rep2, the summary information relating to key stock structure questions developed last year (Appendix 9 of Annex D1 of last year's report - IWC, 2012h) was reformatted and presented to the Committee. It was revised following discussion and a final version is given in Annex D1, Appendix 6. This table provided a useful starting point for final considerations of plausibility of stock structure hypotheses.

The Committee also received Annex D1, Appendix 7, which synthesised information relating to the relevance of departures from Hardy-Weinberg equilibrium at one and two gene loci, to distinguish between stock-structure hypotheses. The author's overall conclusion was that evidence from Hardy-Weinberg departures for more than two O+J stocks is only weak to moderate. Details of discussion are given in Annex D1, item 6.2.

Following these presentations and discussions, the Committee considered a concise overall summary by the 'G5 group' of geneticists of their interpretation of the relative support for and against the five hypothesised stocks (JE, JW, OE, OW, Y), based on the cumulative genetic information presented and discussed during the last several years. This summary table is given in Annex D1, Appendix 8.

During the discussion, there was some attempt to reduce the number of stock structure hypotheses for consideration in the *Implementation Simulation Trials*. It was noted that the conclusion in Annex D1, Appendix 8 regarding Y stock did not depend on data on conception date, which some consider the strongest evidence for Y stock. Some members suggested that as a consequence, Hypothesis A be assigned 'Low' plausibility. This was not agreed to by the proponents of that hypothesis, who pointed out that reliability of the conception date data has been questioned (e.g. IWC, 2012h) and who argued that the genetic data are too limited to be considered strong support for existence of Y stock. Similarly, assigning 'High' plausibility to a 4-stock version of Hypothesis C that includes two O stocks but only one J stock, and 'Medium' plausibility to Hypothesis C did not receive agreement.

It was not possible to reach agreement on any of these alternatives and, as a consequence, all three main stock structure hypotheses (A, B and C) were 'no agreement'. The Committee **agrees** that they should therefore be treated as if they had been assigned 'Medium' plausibility and that the *Implementation Review* should proceed on this basis.

Pastene commented that although several types of data had been considered during the *Implementation* process thus far, he felt that the conclusions on plausibility were too heavily weighted to the genetic data. The Committee reaffirms the importance of using data from a suite of techniques.

Some members expressed their concern that, despite an enormous investment in research, no consensus had been reached on according low plausibility to the hypothesis of two J stocks. They noted the conclusion of five geneticists who were not proponents of any of the hypotheses (Gaggiotti, Hoelzel, Palsbøll, Tiedemann and Waples) that, based on existing genetic data and analyses, the evidence for the two J stock hypothesis is low and the evidence against it is medium or high (Annex D1, Appendix 8). They questioned whether it would ever be possible to agree, on the basis of genetic analyses, that a hypothesis be given low plausibility if such a statement was not considered by the Committee to be sufficient.

Other members considered that the genetic data were insufficient to evaluate any of the three stock structure hypotheses. They noted that genetic data do not provide information on annual mixing rates between *Small Areas*, which has been shown to be an important consideration in the application of the RMP (Martien *et al.*, 2008). They also noted the discussion on the lack of samples from the breeding grounds and recommendations for further research to determine the levels of demographic mixing between breeding populations in relation to management outcomes.

6.3.5.2 MSYR AND OTHER FACTORS

The previous *Implementation* assigned 'high' plausibility to $MSYR_{mat}$=4% and 'medium' plausibility to $MSYR_{mat}$=1% (IWC, 2005a). It was noted that these whales are found in a region in which there are very large fisheries which might impact the prey base. However, the size of any such an effect on MSYR cannot be quantified at this time. In addition, the review of MSY rates will not be completed during the current meeting so there is effectively no new information related to MSYR for western North Pacific minke whales. The Committee therefore **agrees** to assign 'high' plausibility to $MSYR_{mat}$=4% and 'medium' plausibility to $MSYR_{mat}$=1%, as in the previous *Implementation*.

The baseline trials are based on the hypothesis *g*(0)=0.8, based on the estimate of *g*(0) by Okamura *et al.* (2010) for the combination of top barrel and upper bridge. The December 2010 First Intersessional Workshop (IWC, 2012d) had noted that this estimate is conservative because the *g*(0) value is to be applied identically to all surveys, including those by Korean vessels which have lower top barrels, and hence seem likely to miss a greater proportion of minke whales on the trackline. The Committee therefore **agrees** to assign 'high' plausibility to *g*(0)=0.8 and 'medium' plausibility to *g*(0)=1.

Regarding the full set of sensitivity trials, the Committee **agrees** to assign 'medium' plausibility to all except for the following three trials.

(1) Trial 24, which is based on stock structure hypothesis C, but there is a single O-stock and two J-stocks. This trial was assigned 'low' plausibility given the results of the genetics analyses (see Annex D1, Appendix 8).
(2) Trials 21 and 29, which are based on the abundance in sub-areas 5 and 6W, respectively, being set to the 'minimum' values. These trials were assigned 'low' plausibility because the Korean surveys in sub-areas 5 and 6W only cover a small fraction of the overall area of these sub-areas.

The Working Group noted that results of trials 21 and 29 might provide useful information regarding the behaviour of the trials, and **recommends** that these trials be conducted if time is available.

Annex D1, Appendix 5 lists the factors considered in the trials and the final plausibilities assigned by the Committee to each factor.

6.3.6 Specifications of operational features and management variants

In order to implement the *CLA* in trials, specifications of proposed whaling operations are required. Japan intends to conduct coastal whaling in sub-areas 7CS, 7CN and 11, and pelagic whaling in sub-areas 8 and 9. Coastal whaling will be restricted to 10 n.miles. from the coast and during August-October in sub-area 11 to minimise catches of J-stock animals. Whaling in sub-areas 8 and 9 will take place during April-October. Korea intends to conduct whaling using small-type catcher boats in sub-areas 5 and 6W from March to November. Operations will be conducted up to 60 n.miles. from the coast in sub-area 5 and up to 30 n.miles. from the coast in sub-area 6W.

It is also necessary to specify the management variants that will be implemented in the trials. A management variant defines the way the *CLA* is applied to *Management Areas*. This includes specifying *Medium Areas*, *Small Areas* and combinations of *Small Areas* (*Combination Areas*), specifying from which *Management Areas* catches are to be taken, and selecting *Catch-cascading* and/or *Catch-capping* options.

The **agreed** RMP variants and the associated *Small* and *Medium Area* definitions are given in Annex D1, Appendix 9.

The Committee noted that the trials will take longer to run than in previous *Implementations* because the *CLA* will be implemented using the Norwegian 'CatchLimit' program rather than the Cooke version of the *CLA*. The Committee **agrees** that priority should be given to running all RMP variants for the baseline trials as quickly as possible so that any of the RMP variants that are clearly likely to perform 'unacceptably' can be excluded from further consideration. The process of distributing and evaluating trials will be co-ordinated by the Intersessional Steering Group (see Annex Q2).

6.3.7 Specifications and classification of final trials

The final trial specifications are given in Annex D1, Appendix 9.

The Committee **agrees** that for running the trials it will be assumed that the proportional coverage of sub-areas will remain unchanged.

The planned future surveys and a proposal for how past surveys can be combined to calculate survey estimates for *Small Areas* are given in Annex D1, Appendix 9.

SC/64/NPM8 reported that a survey in the Yellow Sea will be conducted during spring 2013. Details are given in Annex D1, item 8.2. The Committee was pleased to hear that additional surveys would continue to be conducted in the waters off Korea and appointed An to provide oversight on its behalf. In relation to survey design, the Committee had recommended some changes to the survey design, which was subsequently modified during the meeting (see Annex D1, item 8.2).

SC/64/O9 reported on a sightings and satellite tagging survey for common minke whales in sub-area 7 in April-June 2011. Only two animals were encountered and efforts to deploy a tag were unsuccessful. SC/64/O10 reported on a sighting and biopsy sampling survey for common minke whales in the Okhotsk Sea, including the Russian EEZ, in May-June 2011. Three schools of minke whales were targeted for biopsy sampling, but no samples were obtained because of difficulties closing on the animals. The Committee expresses its support for continued efforts to collect telemetry and biopsy data to help elucidate stock structure for minke whales in this region. More details are given in Annex D1, item 9.

6.3.8 Consideration of data/analyses to reduce hypotheses in future

The Committee had a general discussion of the fact that, in spite of many years of concerted efforts and a great deal of genetic and non-genetic data, considerable uncertainties remain regarding stock structure of western North Pacific minke whales. This issue is particularly difficult because of the lack of any samples from breeding grounds. The Committee considered a number of types of genetic analyses that might help to reduce these uncertainties in the future. These included sensitivity analyses of recently-used methods and development and application of new analyses, details of which are given in Annex D1, item 9. The importance of considering further work on non-genetic data was also noted. The Committee notes that plans for international collaborative work, including a Workshop, to assist the Committee prepare for an *Implementation Review* under the RMP and the development of an AWMP *SLA* for the Greenland hunt for North Atlantic minke whales (Annex D, Appendix 6) could serve as a useful model for this.

In addition to proposed analyses specifically related to North Pacific common minke whales, the Committee considered an approach that would more broadly address core stock-structure problems that recur for many species in many areas. This general approach has two parts: (1) determining what levels of demographic mixing between breeding populations do and do not make a difference in terms of conservation goals or management outcomes; and (2) using genetic and other methods to determine whether actual levels of connectivity are above or below this threshold.

The Committee **agrees** that work towards this general approach should receive high priority. Suggestions to facilitate implementation of this approach are given in Annex D1, item 9; further discussion is given in Annex I.

It was noted that the *Implementation Review* for North Atlantic common minke whales will undertake some of this work (see Annex D, item 3.3) and that it would be desirable to coordinate efforts in that regard. It was also noted that similar work was being undertaken by scientists at the US Southwest Fisheries Science Center. Cumulative results of these analyses should make it apparent whether general rules of thumb about 'tipping point' levels of migration can be identified, or whether the outcomes are so diverse that each situation must be evaluated on its own merits.

As noted in SC/64/Rep2, in addition to issues of stock structure, other difficulties in conducting the present *Implementation Review* centred on abundance estimates, including their unavailability in some areas and the large CVs for some of the estimates that were available. The difficulties faced by the Committee in determining the acceptability of abundance estimates for use in trials (see Annex D1, item 5.1.2) amplify this concern.

The Committee **agrees** that, to avoid such difficulties in future *Implementation Reviews*, it should consider taking a more active and collaborative approach to this issue. Examination of trial results will assist in identifying the key temporal and geographical areas where new/improved abundance estimates would be most valuable. The Committee should consider developing, in conjunction with the appropriate range states, a short-medium term survey strategy (including design and required effort) and analytical approach that would improve the availability of satisfactory abundance estimates with reasonable CVs at the appropriate geographical and temporal scale to facilitate future *Implementation Reviews*. This could follow a similar process to that used to develop the IWC-POWER programme (Annex G, item 6.2).

6.3.9 Inputs for actual application of the CLA

The Committee **agrees** that the best estimates of the direct catches and the average predicted bycatch from the six baseline trial would be used for applications of the *CLA*.

The Committee did not have sufficient time to select abundance estimates for use in application of the *CLA*. This issue will need to be addressed at the Second Intersessional Workshop (see Item 20).

6.4 North Atlantic common minke whales

6.4.1 Review new information

SC/64/RMP4 summarised the results of aerial surveys covering most of the continental shelf waters of the Icelandic economic zone; the off season component was part of the Icelandic research programme on common minke whales conducted during 2003-07. The Committee noted that SC/64/RMP4 will be considered during the review of this programme in 2013 (see Item 17.1.3).

SC/64/RMP5 summarised a sighting survey conducted in the eastern Norwegian Sea in the *Small Management Area EW* during the summer 2011. Details are given in Annex D, item 3.3.1 This was the fourth year in the ongoing six-year survey programme which runs from 2008-13. The Committee **welcomes** the information provided. The data will be included in developing a future abundance estimate for North Atlantic minke whales.

6.4.2 Prepare for 2014 Implementation Review

The Committee agreed last year (IWC, 2012i) to undertake an *Implementation Review* of common minke whales in the North Atlantic in 2014. It has agreed that this will include a full review of stock structure and other issues, recognising that there has been substantial new information collected over the period since the original hypotheses were developed during the *Implementation* itself (IWC, 1993b).

The Committee recognised that it was important to begin preparations for the review in sufficient time to allow for this thorough analysis. It therefore **recommends** the work plan (including a joint intersessional Workshop with AWMP in 2014) as outlined in Annex D, Appendix 6, to consider stock structure hypotheses for North Atlantic common minke whales. It appointed a Steering Group under Palsbøll (Annex Q4).

6.5 North Atlantic sei whales

Víkingsson *et al.* (2010) represented a proposal to initiate a *pre-Implementation assessment* of sei whales in the Central North Atlantic. As required (IWC, 2005b), the paper provides a broad outline of the available data relevant to a *pre-Implementation assessment*, including historical catches, distribution and abundance from dedicated and non-dedicated sightings surveys, stock structure (Discovery marking, genetics and satellite telemetry), biological parameters, feeding ecology and pathology. The authors concluded that the data are sufficient to warrant a *pre-Implementation assessment* of sei whales in the North Atlantic.

The decision whether to initiate an *Implementation* is made by the Commission. The Committee **recommends** that an intersessional group convened by Víkingsson (Annex Q5) should be established with Terms of Reference to review the available data for North Atlantic sei whales in the context of a *pre-Implementation assessment* and provide a report to the 2013 Annual Meeting. The Committee will review the report and any new information so that the Commission can be advised whether sufficient information is available to proceed with the *pre-Implementation assessment*.

6.6 Work plan

The Committee's views on the work plan developed by the sub-committee on the RMP are given under Item 21.

7. ESTIMATION OF BYCATCH AND OTHER HUMAN-INDUCED MORTALITY (BC)

The report of the Working Group on Estimation of Bycatch and Other Human-induced Mortality is given as Annex J. This subject was introduced onto the Agenda in 2002 (IWC, 2003e) because under the RMP, recommended catch limits must take into account estimates of mortality due to *inter alia* bycatch, ship strikes and other human factors in accordance with Commission discussions at the 2000 Annual Meeting (IWC, 2001a), although of course such mortality can be of conservation and management importance to populations of large whales other than those to which the RMP might be applied. Subsequently, the issue of ship strikes has become of interest to the Commission's Conservation Committee (e.g. IWC, 2011b) while entanglement response is being considered by the Commission's Working Group on Whale Killing Methods and Associated Welfare Issues (e.g. see IWC/64/WKM&AWI Rep1).

7.1 Collaboration with FAO on collation of relevant fisheries data

There has been an ongoing effort by the Secretariat and Sea Mammal Research Unit to consolidate data on entanglements submitted in the National Progress Reports into a single database to be shared with FAO. All bycatch records reported to the IWC for the period 1967-2010 have now been entered. The IWC is currently an observer to the Fisheries Resources Management System partnership (FIRMS), a collaborative partnership organised by the FAO, which enables fishery management bodies to share information. It was hoped that FIRMS may hold data on fishing effort that could be useful in estimating bycatch but FIRMS appears to have changed its focus somewhat since initial discussions. The Committee **recommends** that the Secretariat contact FIRMS to establish whether the partnership is still attempting to collate data on fishing effort in such a way that could be of use to the Committee in estimating bycatch.

7.2 Estimation of bycatch mortality of large whales

A long-term data set on entanglements and disentanglements off South Africa showed two centres of entanglement involving humpback or southern right whales, one off the coast of KwaZulu-Natal (KZN) involving nets set to protect bathers from sharks and the second off the coast of the Western Cape involving traps and attached lines set for rock lobster. Interventions were successful in removing gear from 81% of whales entangled in shark nets off KZN (38 humpback, 17 right whales), while 11 humpback and 2 right whales were found dead. Off the Western Cape, whales were successfully disentangled in 23% of cases (*n*=90) and partially dis-entangled in another 12%. The trend in humpback whale entanglement since 1990 was compatible with the recorded rate of population increase. Entanglement rates of southern right whales apparently increased from 1990 and this could also be attributed to an increase in the population (Meyer *et al.*, 2011).

Entanglement data from the coasts of Newfoundland and Labrador, Canada from 1979 to 2008 included 1,209 large whale entanglements, consisting primarily of humpback whales (80%) and minke whales (15%). Reported entanglements dropped from an average of 64 prior to the moratorium on cod fisheries in 1992 to 19 afterwards (Benjamins *et al.*, 2011).

The Committee noted the value of the extensive data sets described in these studies and that they contributed to an understanding of the impacts, rates and trends over time in entanglement mortality. Both studies had been able to identify trends over time and relate these to either population size or fishing effort. The Committee **recommends** the continuation (or initiation) of these and similar studies and encourages the presentation of results at future Committee meetings.

7.3 Estimation of risk and rates of entanglement

Recent capacity building on entanglement response, conducted by the IWC working in conjunction with both national and regional authorities in Argentina, stimulated an analysis of entangled southern right whales in the province of Chubut. Of nine confirmed cases of entanglement, five involved moorings and four involved marine debris or fishing gear. Six of these whales were successfully released. Many of the mooring systems contained heavy chain and relatively thick diameter rope, but were still found to entangle whales. Whales were often seen ‘playing’ with mooring and anchor lines and this behaviour is believed to be a primary mechanism for entanglement in this region.

The primary focus of the second IWC Workshop on Welfare Issues Associated with the Entanglement of Large Whales held in 2011 (IWC/64/WKM&AWI Rep1) was on entanglement response and capacity building but several topics from the Workshop were also relevant to estimating risk, including the mechanisms by which large whales become entangled. The Committee noted the value of data collected during entanglement responses and welcomed the efforts at the Workshop to develop a data form to standardise the data now being collected around the world. The Workshop participants had also proposed to form a ‘global network of entanglement response teams’ and seek the endorsement of the IWC as an expert panel to advise member nations on issues related to large whale entanglement including setting up response networks, methodologies for understanding scope and impact on local populations, and response capacity building. The Committee **supports** the call for the proposed group and a potential database noting that this will assist the work of the Committee. In many cases there are additional data available from entanglement incidents that could supplement the summary data currently requested in National Progress Reports. The IWC could become a repository for such data through a similar effort to the ship strike database.

7.4 Review progress on including information in National Progress Reports

Due to some delays with changing to electronic submission of Progress Reports, not all of these were reviewed at the meeting. It was noted that, when complete, electronic submission will facilitate linking relevant data to the ship strike database. Suitable links within the submission system could also encourage the entry of data to the ship strike database where more detailed information is available.

7.5 Ship strikes

New information on ship strikes was received for the Arabian Sea region, South Africa and Sri Lanka. A preliminary summary of strandings, lethal entanglements and ship strikes of large whales in the Arabian Sea region, revealed seven documented ship strikes and four lethal entanglements between 2000 and 2012 and included three Arabian Sea humpback whales. The Committee has noted its concern over the status of this population and the increasing shipping traffic in this region (see Item 10.7 for further discussion).

Of 71 recorded mortalities of southern right whales off the South African coast between 1999 and 2010 five bore injuries consistent with a ship strike.

The southern coast of Sri Lanka has one of the busiest shipping routes in the world and overlaps with an area of high whale sightings. Two pygmy blue whales were struck and killed in Sri Lankan waters in early 2012. In the absence of any abundance estimates for the local population, the population impacts of ship strikes are unknown. The Committee **draws attention** to the urgent need for long-term monitoring of the blue whale population in Sri Lankan waters and elsewhere in the northern Indian Ocean. The Committee **recommends** that the Secretariat send a letter to the Sri Lankan Government, drawing their attention to its discussion of this topic and ways in which the Committee may assist.

There is a need to better understand the variables that will affect whether a ship struck whale will strand and predict where death may have occurred. A deterministic model that uses wind archives and outputs of tidal models to predict the drift of floating objects has been developed by MétéoFrance. The model can make forward calculations to predict a stranding location or backward calculations to estimate the likely origin of an object. This model had been used to predict whether small cetacean carcasses in the Bay of Biscay would reach the coast (Peltier *et al.*, 2012). It was noted that some carcasses may 'sail' across the wind to variable degrees and a large whale carcass may also 'swim' after death, because of the action of swell on its tail flukes. The Committee **recommends** further study of carcass drift, detection and deterioration for large whales that could be used to establish the location of death from a ship strike or other sources.

A better understanding of the relationship between vessel speed and collision risk is needed to assess risk. A recent study (Wiley *et al.*, 2011) evaluated the relative risk reduction that might be achieved by speed restrictions. Two studies based on the locations relative to the ship at which humpback whales were observed from cruise ships inferred greater collision risks with increases in speed (Gende *et al.*, 2011; Harris *et al.*, 2012).

A Workshop focusing on ship strikes in the Bay of Biscay was held in London in April 2012 (Bull and Smith, 2012). It made a series of recommendations, mainly dealing with mitigation measures but also related to assessing risk. In particular, the workshop considered ways in which a large data set of observations from vessels may be used. The Committee **welcomes** the approach taken by the Workshop to engage a wide variety of stakeholders, and noted that the report could also be relevant to work in other regions. The Workshop had considered what could be inferred from observations of 'near miss' incidents. The difficulties in defining a 'near miss' have been discussed before and further analyses leading to papers for next year's meeting were encouraged.

A proposal for a Workshop of cetacean and shipping experts to agree on appropriate analytical and modelling techniques to assess ship strike risks arose out of the IWC-ACCOBAMS ship strike Workshop in 2010 (IWC, 2011d). At the time there was some uncertainty about the availability and content of data on shipping density. Analysis approaches are likely to be most effective on a case by case basis and there are now commercial sources of raw data from Automatic Identification Systems (AIS). The Committee **agrees** that a dedicated Workshop is not needed at this stage but **encourages** presentation of papers examining ship strike risks based on overlap of shipping and whale density.

7.6 Continue to develop a global database of ship strike incidents

The IWC has been developing a global database of incidents involving collisions between vessels and whales since 2007.* A web based data entry system has now been in place for two years but there have been few new reports submitted. Most of the interessional database related efforts were to promote awareness, including work by Mattila who has been seconded to the Secretariat to assist with work on mitigating conflicts between whales and marine resource users. As last year, the Committee **agrees** that a more pro-active approach is needed to encourage data to be entered and it **repeats its recommendation** for the appointment of a dedicated IWC ship strike data coordinator with the tasks described in Annex J, Appendix 2 (see also Item 23). The Committee also **recommends** that the Guide for Authors for the *Journal of Cetacean Research and Management* should encourage authors of papers containing data on ship strike incidents to report these to the database.

Some members noted concern that ship strikes may increase in the Arctic as shipping begins to utilise increases in navigable waters resulting from reduced sea ice coverage. The Committee **welcomes** the offer to present new information on this issue at its next meeting.

http://www.iwcoffice.org/sci_com/shipstrikes.htm.

7.7 Other issues

A number of papers concerning the impacts of marine debris were considered under Item 12 (see Annex K). The Committee **encourages** further activities that could help to quantify mortality related to marine debris, noting the difficulty in determining if debris is from actively fished gear.

7.8 Work plan

The Committees discussions on the sub-committee's work plan are incorporated under Item 21.

8. ABORIGINAL SUBSISTENCE WHALING MANAGEMENT PROCEDURE (AWMP)

This item continues to be discussed as a result of Resolution 1994-4 of the Commission (IWC, 1995b). The report of the SWG on the development of an aboriginal whaling management procedure (AWMP) is given as Annex E. The Committee's deliberations, as reported below, are largely a summary of that Annex, and the interested reader is referred to it for a more detailed discussion. The primary issues at this year's meeting comprised: (1) *Implementation Review* of eastern gray whales with special emphasis on the PCFG (the Pacific Coast Feeding Group); (2) undertaking an *Implementation Review* for B-C-B (Bering-Chukchi-Beaufort Seas) bowhead whales; (3) developing *SLA*s and providing management advice for Greenlandic hunts; and (4) review of management advice for the humpback whale fishery of St. Vincent and The Grenadines. This represented a significant workload.

8.1 Complete *Implementation Review* of eastern North Pacific gray whales with an emphasis on the PCFG

At the 2010 Annual Meeting (IWC, 2011h), the Committee agreed that the information on stock structure and hunting presented, although some of it had not met the Data Availability Guideline requirements (IWC, 2004b) for the 2010 review, warranted the development of trials as part of an immediate new *Implementation Review* to evaluate the performance of *SLA*s for hunting in the Pacific Northwest, with a primary focus on the PCFG. It had also agreed that the 2010 *Implementation Review* had shown that the population as a whole was in a healthy state, but that over the next few years, further work should be undertaken to investigate the possibility of structure on the northern feeding grounds, especially in the region of the Chukotkan hunts.

The Committee started the process of the new *Implementation Review* at an intersessional Workshop in 2011 (IWC, 2012c) and followed that with work at the 2011 Annual Meeting (IWC, 2012g). A second Workshop was held in March 2012 kindly hosted by the SWFSC in La Jolla, California (SC/64/Rep3). At that Workshop, most of the effort centred on finalising the operating model and trial structure and completing conditioning. The present meeting reviewed progress made at and since the Workshop and focused on finalising the *Implementation Review*. This summary here incorporates work from the intersessional Workshops and the present meeting.

8.1.1 Stock structure

The *Implementation Review* considers three geographic regions:

(1) the 'north' area (north of 52°N i.e. roughly northern Vancouver Island);
(2) the PCFG area (between 41°N and 52°N); and
(3) the 'south' area (south of 41°N).

The trials consider two stocks ('PCFG' and 'north'). PCFG whales, which are treated as a separate management unit, are defined as gray whales observed (i.e. photographed) in multiple years between 1 June and 30 November in the PCFG area (IWC, 2011f). Not all whales seen within the PCFG area at this time will be PCFG whales and some PCFG whales will be found outside the PCFG area at various times during the year. However, this is not problematic since the historical catches north of 52°N occurred well north of 52°N and future catches will either occur in the Bering Sea or in the Makah U&A (Makah Usual and Accustomed Fishing Grounds). The remaining animals ('north') represent the large eastern North Pacific stock (the stock to which the whales taken during the Chukotkan hunt belong).

Several papers addressed stock structure and related issues (e.g. levels of immigration) at both the intersessional Workshop (see SC/64/Rep3, item 2.4.2.2) and the present meeting (see Annex E, item 2.2.2). Notwithstanding the difficulties arising out of the complexities of the issue, the Committee was particularly pleased to see efforts to use the IWC's TOSSM framework (IWC, 2007e; Lang and Martien, 2012; SC/64/AWMP4; and see Item 11.3). In that context, it was recommended that future TOSSM analyses consider a broader range of parameter choices to explore the robustness of the conclusions to uncertainty. In concluding discussions on this issue, it was agreed that the trials (see Table 3) covered a suitably broad range of immigration rates.

8.1.2 Abundance

The Committee reviewed the mark-recapture abundance estimates provided in SC/64/Rep3 and a new paper (SC/64/AWMP10). The agreed abundance estimates from a modified Jolly-Seber approach (Laake, 2012) are provided in Table 2 for the OR-SVI region (Oregon to southern Vancouver Island ~42-49ºN) and the NCA-NBC region (northern California to northern British Columbia ~41-52ºN). Given the large bias in the first (1998) estimate, the estimates for this year are out of conditioning.

Abundance estimates for the total eastern North Pacific are those provided by Laake (2012); they are given in Annex E, Appendix 2, table 4a.

8.1.3 Catch data (direct and incidental)

The agreed catch series for the period of the trials (i.e. 1930 onwards) are given in Annex E, Appendix 2, table 1. Following work at the intersessional Workshop and further review by an intersessional group established in SC/64/Rep3, it was agreed that the average annual kills during 2000-09 were 2 for the PCFG (December-May), 1.4 for the PCFG (June-November) and 3.4 for the 'south' (December-May) and this information was used to forecast future incidental catches.

8.1.4 Mixing

Mixing relates to: (1) mixing of stocks in the three areas; and (2) the relative probability of whaling in the Makah U&A taking a PCFG whale given the number of PCFG and 'north' whales. The latter can be estimated as the proportion of PCFG whales to total whales in photographs during December-May from the outer coast of northern Washington (0.3; SC/64/Rep3). However, there are a number of uncertainties and assumptions surrounding such an analysis resulting in the need for sensitivity tests (i.e. alternative trials spanning a range of values).

Table 2

Abundance estimates (*N*) and standard errors in OR-SVI and NCA-NBC after exclusion of known calves from the year in which they were identified as calves.

Year	*N*	SE(*N*)
Region: OR-SVI		
1998	63	4.1
1999	78	8.4
2000	89	11.9
2001	117	8.9
2002	133	15
2003	151	13.7
2004	157	15.5
2005	162	15.7
2006	154	15.3
2007	152	14.5
2008	150	12.5
2009	146	14.9
2010	143	16.8
Region: NCA-NBC		
1998	101	6.2
1999	135	12
2000	141	13.2
2001	172	12.6
2002	189	9.2
2003	200	16.4
2004	206	14.9
2005	206	22.6
2006	190	18.8
2007	183	23.1
2008	191	16.1
2009	185	23.2
2010	186	18.7

Table 3

SLA variants suggested by the Makah tribe used in the *Trials*.

Variant number	PCFG limit	Struck and lost count toward APL
1	APL Formula	No
2	APL Formula	Yes
3	APL Formula	Yes
4	1	No
5	1	Yes
6	1	Yes
7	2	No
8	2	Yes
9	2	Yes
10	No limit	N/A
11	No limit	N/A

8.1.5 Biological parameters and MSYR

Biological parameter values were agreed last year (IWC, 2012j). The priors, based on the 2004 *Implementation,* are given in the trial specifications (Annex E, Appendix 2). The most likely value for $MSYR_{1+}$ for the north stock was agreed to be 4.5% i.e. the posterior median from the most recent assessment of this stock (Punt and Wade, 2012). The *Evaluation Trials* also consider a value for $MSYR_{1+}$ for the north stock of 2% (rounded lower 90% posterior bound from the Punt-Wade assessment). There are insufficient data to estimate MSYR for the PCFG and so two scenarios are considered for the Trials as discussed last year (IWC, 2012j): (1) $MSYR_{1+}$ for the PCFG stock is the same as that for the north stock and there is no immigration (this is unlikely given the data but provides a conservative lower bound); and (2) three values of $MSYR_{1+}$ but with some immigration and emigration.

Table 4
Details of factors considered in trials.

Factors	Other levels (reference levels shown bold)
$MSYR_{1+}$ (north)	**2%**, **4.5%**
$MSYR_{1+}$ (PCFG)	**1%**, **2%**, **4.5%**
Immigration rate (annual)	**0, 1, 2**, 4, 6
Pulse immigration (1999/2000)	**0**, 10, **20**, 30
Proportion of PCFG whales in PCFG area, ϕ_{fut}	0, **0.3**, 0.6, 1
Struck and lost rate (PCFG area)	0, **50%,** 75%
Northern need in final year (linear change from 150 in 2010)	**340**, 530
Historic survey bias	**None,** Increasing between 1967 to 2002 from 0.5→1 (north only), 50% (PCFG only)
Future episodic events	**None,** 3 events occur between yrs 1-75 (at least 2 in yrs 1-50) in which 20% of the animals die. Events occur every 5 years in which 10% of the animals die.
Time dependence in *K*	**Constant**, Halve linearly over 100yr, Double linear over 100yr
Time dependence in natural mortality, *M* *	**Constant,** Double linearly over 100yr
Parameter correlations	Yes, **No**
Probability of mismatching north whales, p_2	0, **0.01**, 0.01-0.05
Probability of mismatching PCFG whales, p_1	**0**, 0.5
Frequency of PCFG surveys	**Annual**, 6-year
Incidental catch	**Reference**, double reference, half reference
Future sex ratio	**0.5:0.5**, 0.2:0.8 (M:F)
Episodic events with future pulse events	**None,** 3 events occur between yrs 1-75 (with at least 2 in yrs 1-50) in which 20% of the north stock die and a pulse of 20 animals is added to the PCFG stock.

8.1.6 Variants
The management plan proposed by the Makah Tribe is given in Annex D of SC/64/Rep3 and a number of alternative *SLA*s were proposed for analysis in SC/64/Rep3 as given in Table 3. These variants explore:

(1) how the allowable bycatch of PCFG whales level[10] (APL) of PCFG whales is calculated (three options);
(2) the time of year in which the hunt is modelled to occur and hence whether struck and lost animals are counted against the APL (two options); and
(3) the effectiveness of the *SLA* if only PCFG whales are available for harvest (i.e. in effect a summer hunt).

Variants 1-3 use the APL[11] formula presented in the proposed plan, variants 4-9 have fixed bycatch limits, and variants 10 and 11 explore the impact of not having a limit on bycatch of PCFG whales (i.e. the hunt is only stopped if the total strike limit is reached, or the number of struck-and-lost animals reaches its limit, or the landing limit is reached).

8.1.7 Final trials and conditioning
The final trial structure was agreed in SC/64/Rep3. A summary of the factors considered in the trials is given as Table 4. The *Evaluation Trials* agreed are shown in Table 5 and the *Robustness Trials* are shown in Table 6. These trials were finalised at the March 2012 Workshop (SC/64/Rep3). Conditioning the trials[12] began at the Workshop and was evaluated after the meeting by an intersessional Steering Group (SC/64/AWMP11). Only three trials, B02C, I02C and P05A were eliminated after considering the conditioning results, leaving 72 *Evaluation Trials* in all.

8.1.8 Review results of trials
Evaluation of *SLA*s is based on the objectives accepted by the Commission (IWC, 1983; 1995b) which are to:

(1) ensure that the risks of extinction to individual stocks are not seriously increased by subsistence whaling;
(2) enable aboriginal people to harvest whales in perpetuity at levels appropriate to their cultural and nutritional requirements, subject to the other objectives; and
(3) maintain the status of stocks at or above the level giving the highest net recruitment and to ensure that stocks below that level are moved towards it, so far as the environment permits.

Highest priority is accorded to the objective of ensuring that the risk of extinction to individual stocks is not seriously increased by subsistence whaling.

As their name implies, *Evaluation Trials* are used to examine the performance of the variant *SLA*s against the Commission's objectives. *Robustness Trials* are more extreme trials that are primarily to ensure whether an *SLA* performs as expected in such cases.

The results of all of the trials, expressed in tabular and graphical form (see examples in Annex D, Appendices 3-5) for all agreed performance statistics (conservation and need related) are available from the Secretariat.

The SWG (Annex E, item 2.5.1) screened the trials for conservation performance to focus on those that required more detailed examination. The criteria used were:

(1) the lower 5%ile of the final depletion distribution < than 0.6 (the MSYL level) and the lower 5%ile of the rescaled final depletion is lower than 0.6 for any of variants 1-10;
(2) the trial involved episodic events; and
(3) the lower 5%ile of the trend in 1+ population size indicated a decline in population size of 5% or larger over the final 20 years of the 100-year projection period for any of variants 1-10.

After this initial evaluation a number of features became apparent (see Annex E, items 2.5.1 and 2.5.2), primarily related to conservation performance (apart from variant 5, which had poor need satisfaction) that led the Committee to eliminate further consideration of all but variants 1 and 2.

[10]The Makah Tribe has proposed a hunt management plan with time and area restrictions to target migrating ENP whales, yet there is still a chance that PCFG whales are incidentally harpooned as bycatch to the targeted ENP gray whale hunt.
[11]The APL formula is provided in Annex E, Appendix 2.
[12]Conditioning is the process of selecting the values for the parameters of the operating model such that the predictions from this model are consistent with the available data.

Table 5

The *Evaluation Trials*. Values given in bold type show differences from the base case trial. The final three columns indicate which trials apply to which 'broad' hypotheses (P=pulse, B=bias, I=intermediate – see IWC, 2012i). For 'broad' hypotheses B and I, the number given is the pulse in 1999/2000. Unless specified otherwise ϕ_{PCFG} = 0.3, the struck and lost rate is 0.5, and there are no stochastic dynamics or episodic events. *Trials B02C, I02C and P05A removed after reviewing condition results – see text.

									Hypothesis		
Trial	Need to condition	Description	$MSYR_{1+}$ North	$MSYR_{1+}$ PCFG	Final need	Annual immigration	Survey frequency	Survey bias (north)	P	B	I

8.1.9 Conclusions and selection of SLA*s*

In order to minimise the risk of taking PCFG whales, the management plan developed by the Makah Tribe restricts the hunt both temporally (to the migratory season for gray whales, i.e. 1 December-31 May) and geographically (to the Pacific Ocean region i.e. the Makah U&A except the Strait of Juan de Fuca). Some PCFG whales are present during the migratory season and thus the plan proposes an allowable PCFG limit (APL) during hunts that are targeting eastern North Pacific migrating whales with the aim of ensuring that accidental takes of PCFG whales do not deplete the PCFG. Whales struck in May might have a higher probability of being PCFG whales since they feed in this area in June. The management plan thus proposes an additional requirement that all animals struck-and-lost in May are assumed to be PCFG whales (i.e. count against the APL), whereas whales struck between December and April are not.

Weather conditions and availability of whales makes it likely that most hunting will occur in May. However, there are insufficient data to assess the number of strikes by month. Thus, it is not possible to reliably estimate the proportion of struck-and-lost whales that would count towards the APL. Given this uncertainty about how the plan would respond to failing to take into account struck-and-lost PCFG whales, the Tribe had proposed two *SLA* variants (1 and 2) spanning the options as to when the hunt might occur.

SLA variant 1 proposes that struck-and-lost whales do not count towards the APL i.e. there is no management response to PCFG whales struck but not landed. *SLA* variant 2 proposes that all struck-and-lost whales count to the APL irrespective of hunting month, i.e. the number of whales counted towards the APL may exceed the actual number of PCFG whales struck. A number of other *SLA* variants were proposed by the Tribe to explore additional management options. However, none of the variants precisely mimicked the final management plan proposed.

The trial results revealed:

(1) *SLA* variants 1 and 2 were potentially satisfactory and performed well in nearly all 72 *Evaluation Trials*; and
(2) *SLA* variants 1 and 2 performed acceptably for all *Robustness Trials*.

Given this, the Committee focused on those few trials for which conservation performance required further consideration. Trials with 1% $MSYR_{1+}$ are the most challenging and the conservation performance for some of these trials for both variants was not satisfactory (see Table 7). However, given the available information for the eastern North Pacific population as a whole (the observed recovery rate from severe historical depletion, as well as the current recovery rate from the 1999/2000 mortality event), the most recent assessment (Punt and Wade, 2012) resulted in an estimated MSYR rate of 4.6% [90% posterior interval 2.2%, 6.4%]. Therefore, the $MSYR_{1+}$=1% trials are at the lower bounds of plausibility and the Committee **agrees** that the conservation performance for these trials alone was not reason to preclude the conclusion that both variants have overall satisfactory conservation performance.

The Committee then focused on certain trials within the 2% $MSYR_{1+}$ set for which conservation performance might be considered questionable. Trial 8b (pulse and bias) involved 10% declines in abundance every five years as a proxy for random biological, environmental or anthropogenic events (e.g. disease or contamination). As noted in Annex E, item 2.5.1, these trials are in effect trials with lower $MSYR_{1+}$ than the nominal 2% of the trial. Given this, it **agrees** that both variants 1 and 2 had acceptable performance for these two trials.

Trial 10b (pulse and bias) involves an assumption that the relative probability of harvesting PCFG whales in the Makah U&A is double the observed ratio of PCFG whales to migrating whales observed in the available photo-identification (photo-ID) studies. The conservation performance of *SLA* variant 2 was considered acceptable for this trial but that for variant 1 was considered marginal (Table 7). In discussing the results of this trial, the Committee noted that the ratio of PCFG whales to migrating whales could be monitored directly from data collected during the hunting period allowing this assumption to be evaluated.

In conclusion, the Committee **agrees**:

(1) *SLA* variant 2 performed acceptably and met the Commission's conservation objectives for conservation while allowing limited hunting; and
(2) *SLA* variant 1 performed acceptably for nearly all the trials and could be considered to meet the Commission's conservation objectives provided that it is accompanied by a photo-ID programme to monitor the relative probability of harvesting PCFG whales in the Makah U&A, and the results presented to the Scientific Committee for evaluation each year.

The Committee **endorses** these conclusions and **recommends** them to the Commission. It also **agrees** that the *Implementation Review* is completed. Management advice is discussed under Item 9.2.3.

However, the Committee noted that the *SLA* variants tested did not correspond exactly to the management plan proposed by the Makah to the IWC. The Committee **agrees** to test such a variant intersessionally and examine the results at the next Annual Meeting.

8.1.10 Other business
Spatial mixing between eastern and western North Pacific gray whale stocks along the Pacific coast of North America outside the feeding season raises issues about the population structure within the Sakhalin feeding area (see SC/64/BRG10 and IWC, 2012k). The broad issue of stock structure of North Pacific gray whales is being addressed through a basinwide research programme (see Item 10.4). However, as noted last year, this finding raises concern about the possibility of whales feeding in the western North Pacific being taken during the proposed Makah Tribe hunt in northern Washington.

Last year (IWC, 2012f, p.16) the Committee had stressed three points.

(1) The new information on movements of gray whales highlighted the importance of further clarification of the stock structure of North Pacific gray whales. In particular, the matches of animals from the Sakhalin feeding grounds with animals seen in the PCFG area and other areas along the west coast emphasised the need for efforts to estimate the probability of a western gray whale being taken in aboriginal hunts for Pacific gray whales (noting that this did not require incorporation of western gray whales into the *Implementation Review).*
(2) It had strongly endorsed the basinwide research programme, noting that the results of the research may require further trials for future *SLA* testing; this would be a matter for consideration at the next *Implementation Review* if not before.
(3) The Committee will continue to monitor the situation and was willing to respond to any guidance or requests for further information from the Commission.

SC/64/BRG9 provided an initial modelling approach to address point (1) above. It was discussed extensively in Annex E, item 2.6 and although welcoming this work, a number of questions were raised and further work identified before any conclusions could be agreed. The Committee **recommends** that a revised document be developed for further review at next year's meeting, noting its potential importance for the provision of management advice. An Advisory Group (Annex Q6) was appointed to provide guidance to the authors of SC/64/BRG9.

8.2 Complete *Implementation Review* of Bering-Chukchi-Beaufort (B-C-B) Seas bowhead whales
The procedure and purpose of *Implementation Reviews* for aboriginal whaling *SLA*s is summarised under Item 8.4. The Committee's task is to assess whether there is any new information that would suggest that the range of trials used to evaluate the *Bowhead SLA* is no longer sufficient to ensure that the *SLA* meets the Commission's conservation and user objectives.

8.2.1 Consideration of new information with a focus on whether this implies a need for new trials
A number of papers were submitted presenting new information on a variety of scientific matters relevant to the *Implementation Review*. Full discussion of these papers is given in Annex E, item 3. The summary of discussions in the following sections is somewhat brief as it only focuses on the SWG's deliberations as to whether additional trials are required.

8.2.1.1 STOCK STRUCTURE
Four papers were relevant to stock structure issues.

SC/64/BRG1 reported on a satellite telemetry study of 57 B-C-B bowhead whales tagged during 2006-11. The Committee commended the authors for providing relevant data on bowhead whale migration patterns, and recognised the cooperation of native hunters who were closely involved in all aspects of this study and deployed most of the tags. It **recommends** that such tagging and telemetry efforts continue.

SC/64/AWMP3 compared the use of SNPs and microsatellites for studying population structure, assignment and demographic analyses of bowhead whale populations in the Sea of Okhotsk, B-C-B and eastern Canada, SC/64/AWMP9 presented sequences from three mtDNA genes from 350 bowhead whales from the B-C-B, eastern Canadian Arctic and the Sea of Okhotsk and discussed methods to calculate gene and site specific mutation rates, while SC/64/AWMP1 investigated the demographic history the B-C-B population of bowhead whales using a variety of analytical methods.

The Committee thanked the authors and **agrees** that the information in these papers provide no evidence to suggest that the trials evaluated during the previous *Implementation Review* (IWC, 2007b; 2008c; 2008h; 2008l) did not adequately address stock structure concerns.

8.2.1.2 ABUNDANCE AND RATE OF INCREASE
A new agreed abundance estimate is not required for completion of the B-C-B bowhead whale *Implementation Review*. When a new estimate becomes available it can be incorporated into the *Bowhead SLA* calculations to provide management advice.

SC/64/AWMP5 incorporates the 1985 and 2004 abundance estimates from aerial photography by Schweder *et al.* (2010) into the ice-based survey estimates to obtain an updated ROI for 1978-2004 (fig. 1 of Schweder *et al.*, 2010). The Committee **endorses** this estimate (3.5% with 95% CI of (2.2%, 4.8%)) as the best available estimate of annual rate of increase for the B-C-B bowhead whale population. It also **agrees** that the best estimate of current abundance is 12,631 (95% bootstrap percentile CI 7,900 -19,700; 5% lower limit 8,400) for 2004 (Schweder *et al.*, 2010).

The Committee was pleased to receive information from recent ice-based surveys (2011) that count whales migrating past Barrow, Alaska (SC/64/AWMP7). Full discussion of these surveys will occur in conjunction with the presentation of new abundance estimates within the next two years.

SC/64/BRG4 presented estimates of visual detection probabilities from the spring 2011 ice-based survey of bowhead whales migrating near Barrow, Alaska. The same methods will also be applied to similar data from the 2010 survey. These estimates are highly relevant since they constitute one foundation upon which a future population abundance estimate will be calculated from the 2011 survey counts. This abundance estimate will then be used as input to the *Bowhead SLA*. The authors intend to estimate 2011 abundance using detection probability estimates based only on the new independent observer data. The Committee **endorses** this approach, while also recognising that any possible implications of the shift to the superior IO method might merit future consideration in the context of long term trends. It **encourages** Committee members interested in abundance estimation to contact the authors of SC/64/BRG4 intersessionally with comments and suggestions so that the future abundance estimate for use in the *Bowhead SLA* can be based on an approved estimate of detection probabilities.

SC/64/BRG3 described an aerial photographic survey for B-C-B bowheads conducted from 19 April to 6 June 2011. The field season was very successful, both in terms of total flight days and the very large number of whale images (approximately 6,800) obtained. These photographs are a significant contribution to the bowhead whale photographic catalogue. The Committee recognised the importance of this work as potentially providing an estimate of population abundance for use with the *Bowhead SLA* that is entirely independent of the ice-based survey estimate described in SC/64/BRG4. Analyses of the photo-ID data may also provide better precision in estimates of bowhead whale life-history parameters such as adult survival rate. A detailed discussion of this paper is provided in Annex F.

8.2.1.3 CATCH DATA

SC/64/AWMP8 provides a preliminary summary of subsistence harvest of bowhead whales in Alaska from 1974 to 2011. Further discussion of the paper can be found in Annexes E and F. The Committee welcomes this information and noted that strikes have remained within the need envelope tested during development of the *Bowhead SLA*. It therefore **agrees** that no additional trials are warranted in this regard.

8.2.2 Discussion of new trials

In consideration of the evidence described above, the Committee **agrees** that there is no need for new trials or further simulation testing of the *Bowhead SLA*.

8.2.3 Conclusions and recommendations

The Committee thanked US scientists, the North Slope Borough, Alaska and the native communities for continuing to provide a considerable body of high-quality scientific work which facilitated the SWG's *Implementation Review* process. The Committee **agrees** that the *Bowhead SLA* continues to be the most appropriate way for the Committee to provide management advice for the B-C-B population of bowhead whales. This completes the *Implementation Review* for the B-C-B bowhead whales. Management advice itself is provided under Item 9.3.2.

8.3 Continue work on developing *SLA*s for the Greenlandic hunts (Annex E, Item 4)

In Greenland, a multispecies hunt occurs and the expressed need for Greenland is for 670 tonnes of edible products from large whales for West Greenland; this involves catches of common minke, fin, humpback and bowhead whales. The flexibility among species is important to the hunters and satisfying subsistence need to the extent possible is an important component of management for the hunters. For a number of reasons, primarily related to stock structure issues, development of *SLA*s for Greenland aboriginal hunts (especially for common minke and fin whales) will be more complex than previous *Implementations* for stocks subject to aboriginal subsistence whaling. The Committee has endorsed an interim safe approach to setting catch limits for the Greenland hunts in 2008 (IWC, 2009c), noting that this should be considered valid for two blocks i.e. the target will be for agreed and validated *SLA*s, at least by species, for the 2017 Annual Meeting (assuming that the Commission sets 5-year block quotas in 2012 as scheduled).

The Committee noted the benefits in previous *CLA* and *SLA* developments of a co-operative competition amongst more than one developer. Several members of the SWG indicated that they may be interested in proposing *SLA*s. The Committee noted the multi-species nature of the Greenland hunts and Greenland's desire for flexibility amongst species in meeting its subsistence needs. It **reiterates** that its approach will first be to develop *SLA*s for individual species before considering whether and how to address multispecies considerations (e.g. IWC, 2010a; IWC, 2011l).

In response to a request made at the intersessional Workshop (SC/64/Rep3), the Committee was pleased to receive four papers by Witting (SC/64/AWMP12-15) that summarised the available information on common minke, fin, humpback and bowhead whales off Greenland in the context of developing *SLA*s (summarised in Annex E, Appendix 6). In order to progress essential *SLA* development work, the Committee **agrees** that an intersessional Workshop (to be held at the end of 2012, probably in Copenhagen) was essential to maintain progress. As in previous years, the Committee also **recommends** maintenance of the AWMP Developer's Fund. Financial matters are discussed further under Item 23.

8.3.1 Common minke whales

The Committee notes that the SWG on the AWMP and the sub-committee on the RMP both have interest in North Atlantic common minke whales. It **endorses** the planned co-operative and collaborative process developed (Annex D, Appendix 6) that will culminate in a joint Workshop on the stock structure of this species in the North Atlantic in early 2014. This is planned to inform the RMP *Implementation Review* process for common minke whales in the North Atlantic scheduled for 2014, as well as the *SLA* development process. The operating models developed for the RMP *Implementation* (perhaps with minor adjustment to take account of focus on different populations) will also serve as the basis for the *SLA* development process. The Committee also notes that aspects of the work to be undertaken by Punt described in Annex E, Appendix 7 will assist developers of candidate *SLA*s for the Greenlandic hunts for common minke whales.

8.3.2 Fin whales

The Committee notes that the SWG on the AWMP and the sub-committee on the RMP both have interest in North Atlantic fin whales. A pre-meeting for the North Atlantic fin whale RMP *Implementation Review* is scheduled before the 2013 Scientific Committee meeting. The stock structure discussions at this meeting will provide useful input to the fin whale *SLA* development process. The operating models developed for the RMP *Implementation* (perhaps with minor adjustment to take account of focus on different populations) can also serve as the basis for the *SLA* development process. The Committee notes that aspects of the work to be undertaken by Punt described in Annex E, Appendix 7 will also assist developers of candidate *SLA*s for the Greenlandic hunts for fin whales.

8.3.3 Humpback whales and bowhead whales

Development of *SLA*s for these hunts is relatively simple compared to the common minke whale and fin whale cases. The Committee **agrees** that it should be possible to develop appropriate trial structures and operating models for the humpback and bowhead whale hunts before the next Annual Meeting to enable potential *SLA*s to be evaluated in the future. It **endorses** the proposal outlined in Annex E, Appendix 7 to support this work.

8.4 Guidelines for *Implementation Reviews*

An integral part of the AWMP process is the undertaking of regular or 'special' *Implementation Reviews*, as noted for example during the development process of the *Bowhead SLA* (IWC, 2003b).

The first B-C-B bowhead whale *Implementation Review* took place over two years and was completed in 2007 with most focus being on the issue of stock structure (IWC, 2007b; 2008c; 2008h; 2008l). No changes needed to be made to the *Bowhead SLA* after the review. The first *Implementation Review* for gray whales was completed in 2010 and the *Gray Whale SLA* was not changed with respect to providing advice on the Russian hunt off Chukotka (IWC, 2011h). However, as discussed above, during that review, information was received that led to the need to call for an immediate *Implementation Review* before providing advice for a potential hunt of gray whales by the Makah Tribe on the west coast of the USA. That review is now complete (see Item 8.1)

The Committee had agreed that it would be useful to develop guidelines for *Implementation Reviews*, given the experience gained thus far. The proposed guidelines are provided in Annex E, Appendix 8 and cover the following issues: (1) objectives; (2) timing of regular and special *Implementation Reviews*; (3) outcomes; (4) data availability; and (5) computer programs.

The Committee **adopts** these guidelines.

8.5 Scientific aspects of an Aboriginal Whaling Scheme (AWS)

In 2002, the Committee strongly recommended that the Commission adopt the Aboriginal Subsistence Whaling Scheme (IWC, 2003a). This covers a number of practical issues such as survey intervals, carryover, and guidelines for surveys. The Committee has stated in the past that the AWS provisions constitute an important and necessary component of safe management under AWMP *SLA*s and it **reaffirms** this view. It noted that discussions within the Commission of some aspects such as the 'grace period' are not yet complete.

8.6. Conversion factors for edible products for Greenland hunts

In 2009, the Commission appointed a small working group (comprising several Committee members) to visit Greenland and compile a report on the conversion factors used by species to translate the Greenlandic need request which is provided in tonnes of edible products to numbers of animals (Donovan *et al.*, 2010). At that time the group provided conversion factors based upon the best available data, noting that given the low sample sizes, the values for species other than common minke whales should be considered provisional. The group also recommended that a focused attempt to collect new data on edible products taken from species other than common minke whales be undertaken, to allow a review of the interim factors; and that data on both 'curved' and 'standard' measurements are obtained during the coming season for all species taken.

Last year the Committee had welcomed an initial report, recognising the logistical difficulty of collecting these kinds of data. However, it had noted that considerably more detail was needed, and requested that a detailed report be presented for consideration at the present meeting.

This year, a further report was received from the Greenlandic authorities that provided information on the data collected thus far. The Committee **welcomes** this report and the provision of data. A comparison of these values and the Recommended Conversion Factors Per Animal (RCFPA) from Donovan *et al.* (2010) showed reasonable agreement for humpback and bowhead whales (within 1 SD), but the yield for fin whales was lower than expected. It was not possible to examine this difference *inter alia* because no lengths of the animals included in the analysis were provided.

Although welcoming the report, the Committee expressed some concerns over the insufficient level of detail provided, some inconsistencies within the report, the efficiency of the sampling regime (relatively poor sample sizes) and the extrapolation procedure in which only one meat tote or bin is weighed.

In response to the concern over the lack of samples, it was noted that the Greenland Institute of Natural Resources (GINR) has been asked to investigate this and is working with the hunters and authorities to improve the sample size in the future. The Committee greatly **encourages** this and looks forward to a report on progress made. It also **encourages** the GINR to develop improved protocols including weighing as many of the meat, mattak, and qiporaq bins as possible. Providing a breakdown of products from bowhead whales would be valuable both for conversion factors and biological information.

Given these concerns, the Committee **reiterates** its recommendations from 2010 and 2011:

(1) the provision of a full scientific paper to the next Annual Meeting that details *inter alia* at least a full description of the field protocols and sampling strategy (taking into account previous suggestions by the Committee); analytical methods; and a presentation of the results thus far, including information on the sex and length of each of the animals for which weight data are available; and

(2) the collection and provision of data on Recommendation No. 2 of Donovan *et al.* (2010) comparing standard *vs* curvilinear whale lengths. This should be done for all three species on as many whales as possible. Guidelines and protocols are suggested in Donovan *et al.* (2010).

8.7 Work plan

The Committee's views on the work plan developed by the SWG on the AWMP are given under Item 21.

9. ABORIGINAL SUBSISTENCE WHALING MANAGEMENT ADVICE

The Commission is considering a change from Annual to Biennial Meetings. This has raised the issue within two Scientific Committee working groups as to whether there are any scientific implications for the Commission moving to setting block quotas for an even number of years rather than the present five-year intervals. This issue was addressed at the intersessional AWMP Workshop (SC/64/Rep3) and that report is **endorsed** by the Committee and the conclusions incorporated below.

The Committee recalled that trials for the B-C-B bowhead and eastern North Pacific gray whale *SLA*s had shown satisfactory performance for surveys at intervals of 10 years (and even for some *Robustness Trials* for 15 years). The Committee **agrees** that there are no scientific reasons for the Commission not to set catch limits for blocks of even numbers of years up to 8 years for these stocks. However, it **draws attention** to its discussions of the AWS where it noted that despite the trial results it would not be appropriate for catches to be left unchanged if new abundance estimates were not available after 10 years (IWC, 2004b).

The Committee notes that it does not require changing its regular process of *Implementation Reviews* approximately every five years (with the provision for 'special' reviews should circumstances arise) or an annual examination of new information and provision of advice if requested.

The Committee also notes that the interim safe *SLA* for the Greenland hunts (see Item 9.1 and Items 9.4-9.6 below) had also been tested for surveys at 10-year intervals and shown satisfactory performance and had been adopted by the Commission in 2008 (IWC, 2009a). However, as noted at the time, those tests had been for a restricted number of scenarios than the wider range of hypotheses customarily considered for such trials. It had thus been agreed that this *SLA* was appropriate for the provision of advice for up to two blocks or approximately 2018. The Committee **agrees** that there are no scientific reasons why the next quota block for the Greenland hunts could not be for a 6-year period, noting that the long-term *SLA*s will be available for *Implementation* for the following block quota.

9.1 Eastern Canada and West Greenland bowhead whales

9.1.1 Review new information on eastern Canada and West Greenland bowhead whales

Discussion within the Committee in recent years has focused on stock structure and associated abundance estimates. The present working hypothesis is that bowhead whales in eastern Canada-West Greenland comprise a single stock; the alternative hypothesis assumes two stocks, one in Hudson Bay-Foxe Basin and another in Baffin Bay-Davis Strait. However, the Committee agreed on the need for further genetic analyses last year (IWC, 2012k), recognising the complications arising out of the fact that existing data pertinent to the question of stock structure are held by a non-member nation, Canada.

The Committee was pleased to receive several papers on eastern Canada and West Greenland bowhead whales and details can be found in Annex F, item 2.2.

Alter *et al.* (2012) presented a study on genetic diversity and differentiation across all five putative stocks of bowhead whales, including Baffin Bay-Davis Strait (BBDS), Hudson Bay-Foxe Basin (HBFB), Bering-Beaufort-Chukchi, Okhotsk, and Spitsbergen. Ancient specimens (500-800 years old) from Prince Regent Inlet (PRI) in the Canadian Arctic were also compared with modern stocks. Results show low differentiation between Atlantic and Pacific, consistent with high gene flow between these areas in the recent past. No difference was observed between the two putative/hypothesised Canada-Greenland populations (HBFB/BBDS), which differ from previous results with more samples and a longer fragment of mtDNA. Significant genetic differences between ancient and modern populations were observed, which suggests that PRI harbored unique maternal lineages in the past that have been recently lost, possibly due to loss of habitat during the Little Ice Age and/or whaling. Unexpectedly, samples from this location show a closer genetic relationship with modern Pacific stocks than Atlantic, supporting high gene flow between the central Canadian Arctic and Beaufort Sea over the past millennium despite extremely heavy ice cover over much of this period.

The Committee **welcomes** this work, and noted that this type of collaborative effort across research groups is valuable in advancing the understanding of bowhead whale stock structure.

Spatial overlap of the extreme summer range of bowhead whales was identified from the eastern and western Arctic in the Canadian High Arctic (Heide-Jorgensen *et al.*, 2011). In the summer of 2010, one satellite tagged bowhead whale from West Greenland and one from Alaska entered the Northwest Passage from opposite directions and spent approximately 10 days in the same area but not at the same time.

Wiig *et al.* (2011b) updated on an abundance estimate for bowhead whales in the Disko Bay area of West Greenland. The study employed multi-locus genotype and sex to identify individual bowhead whales at four localities in eastern Canada (Foxe Basin, Pelly Bay, Repulse Bay and Cumberland Sound) and at one locality in West Greenland (Disko Bay).

9.1.2 Review recent catch information

In 2011, one female bowhead whale was landed in West Greenland and none were struck and lost (SC/64/ProgRepDenmark). Two bowhead whales were found dead in West Greenland in 2011, entangled in fishing gear for crabs.

During 2011, three bowhead whales were taken in Canada. More detailed information (e.g. sex, size) was made available by Canada to the Secretariat. The Committee is pleased to receive this information including catch as well as struck and lost data. It **requests** that in the future Canada also provides information on any strandings, entanglements and ship strikes of bowhead whales.

9.1.3 Management advice

In 2007, the Commission agreed to an annual strike limit of two animals (for the years 2008-12), with a carryover provision (IWC, 2008a). The Committee agreed an approach for providing interim management advice in 2008 and this was confirmed by the Commission (IWC, 2009a). The Committee recalled that the agreed abundance estimate for eastern Canada/West Greenland is 6,344 (95% CI: 3,119-12,906; IWC, 2009d) for 2002. The most recent agreed estimate (IWC, 2012k; Wiig *et al.*, 2011b) for the spring aggregation in the West Greenland area is 1,747 (95% CI: 966-2,528) for 2010.

Using the agreed interim safe approach and the 2010 estimate for West Greenland, the Committee **repeats its advice** that an annual strike limit of two whales in West Greenland will not harm the stock.

The Committee **agrees** that it will review the updated analysis for the 2010 estimate for West Greenland (Wiig *et al.*, 2011a) at next year's meeting, noting that although slightly lower, if adopted it does not alter the management advice. The Committee is also aware that catches from the same stock have been taken by a non-member nation, Canada. Should Canadian catches continue at a similar level as in recent years, this would not change the Committee's advice with respect to the strike limits agreed for West Greenland. Given the importance of this issue, the Committee **recommends** that the IWC Secretariat continues to contact Canada requesting information about catches and domestic catch limits for bowhead whales.

9.2 Eastern North Pacific gray whales

9.2.1 New information

SC/64/AWMP2 presented the results of comparison of the genetics of gray whales sampled off Vancouver, Canada (i.e. PCFG whales), and San Ignacio Bay, Mexico. Results supported the conclusion that PCFG and the larger population are from the same breeding group. However results from other studies of photo-ID and mtDNA indicate that during the summer, whales of the PCFG represent a seasonal subpopulation driven by maternally directed site fidelity. The Committee's work (Item 8.1) is based on treating the PCFG as a separate management stock.

There are at least two sets of genetic samples for PCFG whales, one is possessed by the research group in Canada, and the other by the Southwest Fisheries Science Center in

La Jolla, USA. The Committee **recommends** that the two groups consider merging these data sets as this will result in a more robust evaluation of PCFG gray whales. The Committee also **suggests** that future work uses a greater number of microsatellites and increased mtDNA length.

The Committee received two papers on photo-ID studies undertaken in Mexican waters. SC/64/BRG14 provided information about the number of eastern North Pacific gray whales using Laguna San Ignacio, Baja California during the 2011 and 2012 winter breeding season. High counts of female-calf pairs in 2011 and 2012 suggest that more females whales are using the Laguna San Ignacio region as a winter aggregation area than during the 2007-10 period. SC/64/BRG23 presented information on a new photographic identification programme in the Bahía Magdalena lagoon complex of gray whales in 2012 (there is little recent information from there). A total of 275 individual whales were photographically identified, of which 234 were single whales and 41 were mother-calf pairs. 83% of the mother-calf pairs were sighted in waters around the López Mateos, and the majority of singles (89%) were sighted in waters near to mouth of Bahía Magdalena.

The Committee **thanks** the authors for these studies in Mexican waters which are discussed further in Annex F, item 4.3.1, It noted the value of long-term datasets and **encourages** updates in future years.

SC/64/BRG18 presented results from a linear model relating the average ice cover over the Bering Sea during the first 15 days of May with estimates of northbound gray whale calves the following spring for the years 1994-2010 (ice years 1993-2009) and further used to predict calf estimates for 2011 to 2013. There is a negative relationship between the area of the Bering Sea covered by seasonal ice during the first two weeks of May and the number of gray whale calves estimated by shore-based counts off central California the following spring (Perryman *et al.*, 2011; Perryman and Rowlett, 2002). It is not clear whether an ice-shortened feeding season has a significant impact on overall population condition or health. Measurements of southbound gray whales in vertical aerial photographs collected in 2012 indicated that overall population condition was comparable to that in previous years when the observed strandings were about average.

The Committee **thanks** the authors for this analysis of data from an extremely valuable long-term dataset. The Committee **recommends** that continued annual shore-based counts be accorded high priority. It also **recommends** aerial photogrammetric body condition studies be continued next year, and results compared to existing data to test the hypothesis that ice conditions in May influence gray whale body condition and reproductive output. The Committee also **encourages** a more integrated analysis using ice cover data for spring in the Chukchi Sea and spring and autumn for the Bering and Chukchi seas.

Last year (IWC, 2012k) the Committee had encouraged the undertaking of a more quantitative integrated analysis for the lagoon counts in Baja California, Mexico and the northbound calf counts in California, given the length of the time series. It was also suggested that correlations between calf production in western and eastern gray whales be examined. The Committee **reiterates** its advice from last year.

SC/64/BRG21 provided information about coastal counts of gray whales off Chukotka Peninsula, Russia, and monitoring of the harvest. The Committee was pleased to see a variety of biological information collected from the harvested whales and **recommends** the collection of additional data and samples, such as tissue for genetic analyses, tissue samples for understanding the cause of 'stinky whales' (see also Item 12), and photographs for comparison with catalogues. Catch data are discussed further below.

9.2.2 Review of recent catch information

The Russian Federation reported that a total of 128 gray whales were struck in Chukotka, Russia in 2011[13]; two were lost and 126 were landed. Of the landed whales, two were 'stinky' and not used for human consumption.

9.2.3 Management advice

In 2007, the Commission agreed that a total catch of up to 620 gray whales was allowed for the years 2008-12 with a maximum of 140 in any year. No new data were presented this year to change the advice for the large eastern North Pacific population and therefore the Committee **agrees** that the *Gray Whale SLA* remains the appropriate tool to provide management advice for eastern North Pacific gray whales apart from the consideration of the PCFG and the Makah hunt (see Item 8.1). The Committee **reiterates** that the current strike limits will not harm the stock.

With respect to the management plan variants provided by the Makah Tribe, the *Implementation Review* was completed this year (Item 8.1) and the Committee **agrees**:

(1) hunt variant 2 performs acceptably; and
(2) hunt variant 1 performs acceptably provided that it is accompanied by a photo-ID programme to monitor the relative probability of harvesting PCFG whales in the Makah U&A, and the results presented to the Scientific Committee for evaluation each year.

Matters related to the possibility of an animal feeding in the western North Pacific being taken in the PCFG area are discussed under Item 8.

9.3 Bering-Chukchi-Beaufort (B-C-B) Seas stock of bowhead whales

9.3.1 New information

SC/64/BRG1 provided results of seasonal movements of the B-C-B stock of bowhead whales from a satellite telemetry study of 57 tagged whales during 2006-11. All but one tagged whale migrated past Point Barrow in spring and went to Amundsen Gulf. That remaining whale was tagged at Barrow in summer, wintered in the Bering Sea and then summered along the Chukotka coast in the Chukchi Sea. While most whales summered within the Canadian Beaufort Sea, extensive summer movements included travel far to the north and northeast. Autumn movements coincided in space and time with oil and gas activities and potentially with shipping activities. Likely important feeding areas included Amundsen Gulf in spring and summer; Barrow in summer and autumn; Wrangel Island (some years) in autumn; the northern Chukotka coast in autumn; and the western Bering Sea in winter.

Full discussion of this paper can be found in Annex F, item 2. It was noted that this work indicates that earlier estimates of bowhead whales off Cape Pe'ek on the Chukchi Peninsula (Melnikov and Zeh, 2007) were probably B-C-B bowhead whales and not a separate smaller stock. The Committee **encourages** the continuation of this work, including the future analysis of other environmental covariates (e.g. physical oceanography) relating to B-C-B bowhead whale migration and distribution.

[13]This updates the information in SC/64/BRG21 for 2011.

Results of a year-long acoustic study of B-C-B stock of bowhead whales were reported (Moore *et al.*, 2012). Calls from bowhead whales were recorded in October 2008, and from March-August 2009, on a recorder deployed on an oceanographic mooring near the Chukchi Plateau (*ca.* 75°N, 168°W). The rate of bowhead whale call detection was highest from May to August, when sea ice diminished from nearly 100% surface cover to zero and corresponded to a period of very high zooplankton backscatter signal from June to August.

SC/64/BRG3 reported the results of aerial photographic surveys of bowhead whales near Point Barrow, Alaska during 2011. Aerial surveys have periodically been flown in this area since 1984. Sufficient photo recaptures from the 2011 surveys are expected to calculate a mark-recapture abundance estimate with reasonable precision. SC/64/AWMP7 provided details about a successful ice-based survey in 2011 (see Item 8.2.1.2). An ice-based estimate of abundance is expected in 2014 and the photo-ID estimate thereafter. This would provide a rare opportunity to compare two independent large-whale abundance estimates in the same season.

SC/64/BRG4 presented estimates of visual detection probabilities from the spring 2011 ice-based survey of bowhead whales migrating near Barrow, Alaska, based on a new method first discussed last year (Givens *et al.*, 2011). This paper is also discussed under Item 8.2. In discussion, it was noted that the estimates in SC/64/BRG4 were slightly lower but generally consistent with those from earlier surveys, and the precision of the new estimates was better due to the new experimental design and a larger dataset. The Committee **agrees** that the estimation approach and application of the resulting detection probabilities to applicable years of survey data represents a methodological improvement over previous efforts. As noted under Item 8.2 it **encourages** Committee members with any detailed comments to submit those to the authors intersessionally.

SC/64/BRG8 reported on progress being made to sequence the bowhead whale transcriptome. It was noted in discussion that this research has the potential to provide insights into the life history, ecology, evolution and genetics of bowhead whales, with broader implications for other great whales.

9.3.2 Management advice

SC/64/BRG2 presented information on the 2011 Alaskan hunt. A total of 51 bowhead whales were struck resulting in 38 animals landed. No bowhead whales were reported struck and lost at Chukotka.

In 2007, the Commission agreed that a total of up to 280 B-C-B bowhead whales could be landed in the period 2008-12, with no more than 67 whales struck in any year and up to 15 unused strikes being carried over each year. In the light of the *Implementation Review* completed this year (see Item 8.2), the Committee **agrees** that the *Bowhead SLA* remains the most appropriate tool for providing management advice for this harvest. It **reiterates** that the present strike and catch limits are acceptable.

9.4 Common minke whales off West Greenland

9.4.1 New information

In the 2011 season, 174 minke whales were landed in West Greenland and 6 were struck and lost (SC/64/ProgRepDenmark). Of the landed whales, there were 133 females, 39 males, and two whales of unreported sex. Genetic samples were obtained from 90 of these whales. The Committee **re-emphasises** the importance of collecting genetic samples from these whales, particularly in the light of the proposed joint AWMP/RMP Workshop (see Annex D).

9.4.2 Management advice

In 2007, the Commission agreed that the number of common minke whales struck from this stock shall not exceed 200 in each of the years 2008-12, except that up to 15 strikes can be carried forward. In 2009, the Committee was for the first time ever able to provide management advice for this stock based on a negatively biased estimate of abundance of 17,307 (95% CI 7,628-39,270) and the method for providing interim management advice which was confirmed by the Commission. Such advice can be used for up to two five year blocks whilst *SLA*s are being developed. Based on the application of the agreed approach, and the lower 5th percentile for the 2007 estimate of abundance, the Committee **repeats** its advice of last year that an annual strike limit of 178 will not harm the stock.

9.5 Common minke whales off East Greenland

9.5.1 New information

Nine common minke whales were struck (and landed) off East Greenland in 2011 and one was struck and lost (SC/64/ProgRepDenmark). All landed whales were females. Catches of minke whales off East Greenland are believed to come from the large Central stock of minke whales. No genetic samples were obtained from minke whales caught in East Greenland. The Committee **re-emphasises** the importance of collecting genetic samples from these whales, particularly in the light of the proposed joint AWMP/RMP Workshop (see Annex D).

9.5.2 Management advice

In 2007, the Commission agreed to an annual quota of 12 minke whales from the stock off East Greenland for 2008-12, which the Committee stated was acceptable in 2007. The present strike limit represents a very small proportion of the Central stock – see Table 8). The Committee **repeats** its advice of last year that the present strike limit would not harm the stock.

Table 8

Most recent abundance estimates for minke whales in the Central North Atlantic.

Small Area(s)	Year(s)	Abundance and CV
CM	2005	26,739 (CV=0.39)
CIC	2007	10,680 (CV=0.29)
CG	2007	1,048 (CV=0.60)
CIP	2007	1,350 (CV=0.38)

9.6 Fin whales off West Greenland

9.6.1 New information

A total of five fin whales (all females) were landed, and none were struck and lost, in West Greenland during 2011 (SC/64/ProgRepDenmark). No genetic samples were obtained from caught fin whales in 2011. The Committee **re-emphasises** the importance of collecting genetic samples from these whales, particularly in the light of the proposed work to develop a long-term *SLA* for this stock.

9.6.2 Management advice

In 2007, the Commission agreed to a quota (for the years 2008-12) of 19 fin whales struck off West Greenland. This was subsequently modified and at the 2010 Annual Meeting

Greenland voluntarily reduced the limit to 10 until 2012 (IWC, 2011c). The Committee agreed an approach for providing interim management advice in 2008 and this was confirmed by the Commission. It had agreed that such advice could be used for up to two blocks whilst *SLA*s were being developed. Based on the agreed 2007 estimate of abundance for fin whales (4,539 95%CI 1,897-10,114), and using this approach, the Committee **repeats** its advice that an annual strike limit of 19 whales will not harm the stock.

9.7 Humpback whales off West Greenland

9.7.1 New information

A total of eight (three males; five females) humpback whales were landed (none were struck and lost) in West Greenland during 2011 (SC/64/ProgRepDenmark). Genetic samples were obtained from three of these whales. The Committee **re-emphasised** the importance of collecting genetic samples and photographs of the flukes from these whales, particularly with respect to the YoNAH and MoNAH initiatives (Clapham, 2003; YoNAH, 2001).

9.7.2 Management advice

In 2007, the Committee agreed an approach for providing interim management advice and this was confirmed by the Commission. It had agreed that such advice could be used for up to two five year blocks whilst *SLA*s were being developed (IWC, 2008e). Based on the agreed estimate of abundance for humpback whales (3,039, CV 0.45, annual rate of increase 0.0917 SE 0.0124) and using this approach, the Committee **agrees** that an annual strike limit of 10 whales will not harm the stock.

9.8 Humpback whales off St. Vincent and The Grenadines

9.8.1 New information

Last year the SWG noted that it had received no catch data from St. Vincent and The Grenadines for 2010/11. This year the Secretariat received information from the Government that a 35-foot whale was taken on 18 April 2011 (IWC Secretariat, 2011) and a 33.75 foot female taken on 14 April 2012. After the meeting it was also informed of a struck and lost animal during the 2011 hunt. The Committee was pleased to hear that genetic samples and photographs were taken and that the USA and St. Vincent and The Grenadines are discussing the transfer of tissue samples from this whale for analysis and storage at SWFSC (the IWC archive where *inter alia* SOWER samples are stored). Iñíguez reported information on a hunt on the 11 April 2012 and a struck and lost animal on the 22 March 2012.

The Committee also repeats its previous strong **recommendations** that St. Vincent and The Grenadines:

(1) provide catch data, including the length of harvested animals, to the Scientific Committee; and
(2) that genetic samples be obtained for any harvested animals as well as fluke photographs, and that this information be submitted to appropriate catalogues and collections.

9.8.2 Management advice

In recent years, the Committee has agreed that the animals found off St. Vincent and The Grenadines are part of the large West Indies breeding population (11,570, 95% CI 10,290-13,390; Stevick *et al.*, 2003). The Commission adopted a total block catch limit of 20 for the period 2008-12.

The Committee **repeats** its advice of last year that this block catch limit will not harm the stock.

10. WHALE STOCKS

10.1 Antarctic minke whales (Annex G)

The Committee is in the process of undertaking an in-depth assessment of the Antarctic minke whale. The primary abundance data are those collected from the 1978/79 to 2003/04 IWC-IDCR/SOWER cruises (e.g Matsuoka *et al.*, 2003) that had been divided into three circumpolar series (CPI, CPII and CPIII). Two different methods for estimating minke whale abundance from the last two circumpolar data series have been developed in recent years. Although they gave different estimates of abundance, both were consistent in estimating a decline in circumpolar abundance between CPII and CPIII (IWC, 2012l). The Committee has been working to resolve the differences between the estimates for some time and last year believed that it would be possible to present an agreed abundance estimate at this year's meeting. The Committee has also been discussing uncertainties about stock structure, especially in the Indian Ocean and Pacific sectors, which are the sectors where catches have been taken in recent years (IWC, 2008d).

10.1.1 Stock structure

Two genetically distinct populations of Antarctic minke whales have been identified in the Area IIIE-VIW feeding grounds (IWC, 2008d). There is no sharp boundary between them, only a 'soft' boundary; the two populations overlap, but one predominates in the east, called the Pacific or P-stock, and the other in the west, called the Indian Ocean or I-stock. The extent and location of the overlap is an important issue for assessment.

SC/64/IA4 presented a new integrated analysis of three different sources of data: morphometrics; microsatellites; and mitochondrial DNA. The goal is to estimate longitudinal segregation of the breeding populations on the Antarctic feeding grounds. The model is intended to allow the location of the soft boundary to move from year to year. The method was applied to the extensive data for the Antarctic minke whales taken by the JARPA and JARPA II surveys. The results indicated that the spatial distribution of the two populations have soft boundary in Area IV-E and V-W, which does vary clearly and significantly by year. The results also suggest that the boundary is sex-specific.

The Committee noted that the approach used is simple and potentially powerful. Aside from the general relevance of the results to understanding Antarctic minke whale dynamics, it might in the future prove useful in allocating historical catches to stocks. The Committee **endorses** the specific investigations for further statistical analysis given in Annex G item 5.1.

10.1.2 Abundance estimation of Antarctic minke whales

In order to reach its goal of having agreed abundance estimates by the 2012 Annual Meeting, an intersessional Workshop was held in Bergen, Norway, in May 2012 (SC/64/Rep4). It made substantial progress in identifying reasons for the large differences between earlier 'trackline conditional independence' and 'hazard probability based' estimates of Antarctic minke whale abundance (the 'SPLINTR' model, Bravington and Hedley, and the 'OK' model, Okamura and Kitakado, respectively). It also identified aspects of the OK model that needed adjustment related to plausibility of mean dive-time estimates from fits of the model and the resultant effects on *g*(0), compared to independent estimates of *g*(0). A work programme was agreed for completion by the 2012 Annual Meeting which resulted in three papers - SC/64/IA2, SC/64/IA12 and SC/64/IA13. The Committee thanked the authors for completing the work plan. Detailed discussions can be found in Annex G, item 5.3.

SC/64/IA12 analysed data from the IWC/SOWER 2004/05 video dive time experiments. The Committee was pleased to receive these estimates, which after discussion within the intersessional Steering Group became key inputs for the OK method. SC/64/IA2 presented a revision of the 'Norwegian Product' formulation of the OK model and investigated sensitivity to a number of factors. The abundance estimates were lower than previously estimated by versions of the OK model, after incorporating the new mean dive-times and the resultant lower $g(0)$ values. SC/64/IA3 presented a 'Norwegian Product' version of SPLINTR, also using the externally-estimated dive-times. The authors noted that their fits showed some problems and counterintuitive results but also noted that they had insufficient time to investigate the model. They thus considered that although the framework of the model therein seemed reasonable, the actual estimates were not ready for consideration.

Based on considerable experience from previous years, the intersessional Workshop had identified a core set of diagnostics most capable of revealing important model deficiencies when modelling IDCR/SOWER minke whale data (SC/64/Rep4). The main issue for SC/64/IA2, the OK model, was that the observed proportion of near-simultaneous compared to delayed duplicates was considerably lower than the predicted; this is potentially important in terms of estimating $g(0)$ and thus overall abundance, because of the close link to mean dive-time. The likely cause of the misfit is the aggregation-over-time that is required in order to deal with rounding and measurement errors in timing and distance estimates in IDCR/SOWER, in conjunction with the clumped nature of real whale dive patterns (in contrast to the independence of successive dive-times assumed by OK models). For the reasons discussed in Annex G, however, the Committee **agrees** that the within-duplicate lack-of-fit was unlikely to imply serious bias in abundance estimates.

Given the progress made and results presented and discussed in Annex G, it was agreed that there was no need to consider further the process of averaging estimates from the two models proposed last year (IWC, 2012l). It was reassuring that two completely independent implementations of the Norwegian Product (NP) model appear to be giving consistent results and showed little sensitivity to the input values for mean dive-time in the neighbourhood of the best independent estimates of dive time from SC/64/IA12.

The starting point for determining the best available consensus estimate, was the authors' 'preferred estimates' in SC/64/IA2 using the best estimates of mean dive-time from SC/64/IA12, and then applying the appropriate adjustment factors agreed last year (IWC, 2012e) with some minor changes. All the adjustments are estimates, but are modest enough that their impact on CV can reasonably be neglected. A CPII spatial adjustment of 15% is the largest adjustment, and reflects some imbalance of coverage within survey strata in CPII, something that was much reduced in CPIII. All other adjustments are minor.

The resulting estimates are shown in Table 9. Because the northern extent of the surveyed regions differs between CPII and CPIII, two sets of estimates are given, 'survey-once' and 'CNB' (Common Northern Boundary). The survey-once estimates cover all of the surveyed regions in each CP series (using the most recent or most complete survey in cases of duplication). The CNB estimates exclude part of the surveyed regions in each series to ensure a consistent northern limit; these are the most appropriate estimates for a comparison of abundance estimates between CPII and CPIII. The CNB estimates are also the basis for the Additional Variance (AV) calculations (IWC, 2010j) which address the non-synoptic nature of the surveys, i.e. that whales may move into and out of any given surveyed area from year to year. The 'CV internal' row reflects the uncertainty associated with the abundance estimate of whales in the surveyed region at the time of the survey, whereas the 'CV with AV' row reflects the uncertainty associated with the average number of whales present in the surveyed region across the whole of that CP series, and is more useful for most subsequent analyses. CVs are approximately the same for survey-once as for CNB, so only one set is shown. Note that there are also correlations between the estimates (not shown) in different *Management Areas* within each CP (but not between CPs) since model parameters are estimated jointly for each whole CP.

The Committee **agrees** that the numbers in Table 9 represent the best available abundance estimates of Antarctic minke whales in the surveyed areas during the years of CPII and CPIII. The potential sources of bias have now been much more thoroughly addressed than in the existing 'standard method' estimates (Branch, 2006), and the results are consistent with recent external datasets (e.g. the post-2004 SOWER cruise experiments on school size estimation, video dive time and BT mode). The explanation for the large difference between the estimates from original OK (e.g. Okamura and Kitakado, 2011) and original SPLINTR (e.g Bravington and Hedley, 2009) methods has been identified as the interaction between diving behaviour and timing errors and the difference has been reduced to plausible levels by imposing direct estimates of mean dive-time in the NP models. The Committee agrees that it is unlikely that any remaining bias is substantial.

Table 9

Best estimates of Antarctic minke whale abundance by *Management Area* adjusted by the factors agreed in Table 1. See text for explanation.

CP		IWC *Management Area* I	II	III	IV	V	VI	Total
II	Survey once	85,688	130,083	93,215	55,237	300,214	55,617	720,054
	CNB	84,978	120,025	86,804	51,241	285,559	49,885	678,493
	CV internal	0.16	0.14	0.20	0.17	0.13	0.22	0.08
	CV with AV	0.34	0.40	0.44	0.39	0.31	0.39	0.18
III	Survey once	38,930	57,206	94,219	59,677	183,915	80,835	514,783
	CNB	34,369	58,382	68,975	55,899	180,183	72,059	469,866
	CV internal	0.20	0.19	0.15	0.34	0.11	0.14	0.09
	CV with AV	0.39	0.38	0.35	0.49	0.36	0.37	0.18
CPIII:CPII		0.40	0.49	0.79	1.09	0.63	1.44	0.69

The new **agreed** estimates for the survey-once case are 720,000 for CPII (1985/86-1990/91) with 95% CI [512,000, 1,012,000], and 515,000 for CPIII (1992/93-2003/04) with 95% CI [361,000, 733,000]. The estimates are subject to some degree of negative bias because some minke whales would have been outside the northern and southern (surveyable, ice edge) boundaries. The improved analyses have resulted in many estimates differing appreciably from the 'Standard Method' estimates (Branch and Butterworth, 2001; IWC, 2006b, p.21). For CPII, the new best estimate of total abundance is slightly lower (720,000 compared to 769,000 standard estimate) whereas for CPIII the new best estimate is substantially higher (515,000 compared to 362,000). There are two primary reasons for the differences: (1) the spatial adjustment required for CPIII is much less than for CPII; and (2) the mean school size is appreciably smaller in CPIII than CPII which affects the net adjustment for *g*(0). The ratio of total abundance in CPIII to CPII, formerly 0.47 with the standard method, is now estimated to be 0.69 with 95% CI [0.43, 1.13] for the 'CNB' estimates.

Annex G, item 5.3.2 identified some future work, partly to check and deal with any small remaining bias issues, and also for the benefit of other abundance estimation in general. A valuable aspect of SOWER/IDCR is the consistency of its protocols and its large sample size, unparalleled amongst cetacean sightings datasets, which allow the development of realistic tests and sophisticated estimation methods applicable to many cetacean abundance estimation cases beyond Antarctic minke whales.

The Committee **expresses** its thanks to the Abundance Estimation Working Group for its tremendous collaborative efforts in obtaining agreed estimates after several years of intensive and innovative work. The developers (Bravington, Hedley, Kitakado and Okamura) are to be particularly commended as is the recent input and enthusiasm of Butterworth, Skaug and Walløe. The Committee now has confidence in these open-water estimates and a more comprehensive understanding of the modelling requirements for IDCR/SOWER data. The Committee also places on record its considerable appreciation to all those involved in the IDCR/SOWER cruises (1978/79-2009/10) – the Japanese Government (and in the early years the government of the then USSR), the IWC, the originators of the programme, the scientists and crews of the participating vessels, the planners of the cruises and the analysts, whose dedication and hard work over many years have led to this agreed result.

10.1.3 Reasons for differences between estimates from CPII and CPIII

The confidence interval for the ratio of the total estimated abundance from CPII and CPIII included 1.0 and thus a null hypothesis of no change in overall abundance between the two periods would not be rejected. Nevertheless, the Committee considered that a change was quite likely, and discussed possible reasons for a decline in the estimated abundance of whales in the surveyed areas.

Between CPII and CPIII, the point estimates of Antarctic minke whale abundance show a large decline in three *Management Areas* (I, II, and V) and an increase in Areas IV and VI (Table 9). Overall, the circumpolar estimates are 30% lower between CPII and CPIII. Since the Committee is now satisfied that the remaining biases in the agreed estimates are unlikely to vary greatly over the duration of the CPII and CPIII cruises. Therefore the differences seen in Table 9 probably do reflect real changes in abundance in the open-water areas surveyed.

The Committee is exploring possible reasons for this. Noting that the IDCR/SOWER cruises were neither synoptic nor did they cover the entire range of potential minke whale habitat, one hypothesis is that the decline in estimated abundance was due to more whales being in unsurveyed regions during CPIII than in CPII. This suggests the following (not mutually exclusive) possibilities:

(1) a much higher proportion of whales in the pack ice or in open-water areas (polynyas) within the pack ice in CPIII, as compared to CPII;
(2) extensive longitudinal (east-west) whale movements from year to year, and surveys conducted as part of CPII happened to encounter higher densities in certain areas, as compared to those during CPIII;
(3) a much higher proportion of the total population was north of 60ºS during CPIII;
(4) intra-year movements in open water within the surveyed areas that were not adequately covered by the trackline design in space and time, with respect to environmental variables; and
(5) a genuine decrease in abundance of Antarctic minke whales.

In order to examine (1) above, an intersessional sea ice group was established last year to: (a) consider technical aspects of sea ice data which will be used to bound or estimate the abundance of Antarctic minke whales in the south of the ice edge; and (b) consider appropriate analysis methods to bound or estimate the abundance of whales south of the ice edge.

SC/64/IA3 reviews some technical aspects of the sea ice data obtained by IDCR/SOWER, ASPeCt (Antarctic Sea Ice Processes and Climate), satellite sensors and NIC (National Ice Center). The definitions of the sea ice edge vary between the different data sources because their objectives and applied techniques are different. The IDCR/SOWER definition of the sea ice edge is somewhat operational compared to that for other data sources. However, its definition is believed to be consistent for the period 1978 to 2003, and the authors believe it is the most appropriate boundary for abundance estimation in years and areas where IDCR/SOWER surveys were undertaken. They also conclude that the sea ice concentrations derived from passive microwave (PM) remote sensing are probably the best sea ice data to be used for the purpose of estimating abundance of Antarctic minke whales to the south of sea ice edge in areas where IDCR/SOWER observations are not available (the PM records date back to 1979).

SC/64/IA10 is an appraisal of methods and data to estimate abundance of Antarctic minke whales within sea ice covered areas of the Southern Ocean. With new estimates of densities of Antarctic minke whales (from aerial surveys) in certain areas of sea ice (i.e. Weddell Sea and east Antarctica), and model-based abundance methods which allow extrapolation, there is an opportunity to compare bounds and magnitudes of abundances, both inside and outside of the sea ice region, to assess how likely the 'moved-into-sea-ice' hypothesis is. In the first instance, the authors recommended that comparisons of inside/outside abundances be made for areas and years where the aerial surveys were conducted. If these analyses are inconclusive from the perspective of the 'moved-into-sea-ice' hypothesis, there is a recommendation to extend the analysis to estimating circumpolar densities, and extrapolating back over the period of CPII and CPIII. The recommended analysis will give full consideration to how variable minke whale densities can be over space and time. Furthermore it should be recognised that such analyses will involve a great deal of work and may not yield helpful results.

Since Antarctic minke whales congregate along the ice edge, potential problems in estimating abundance inside/outside of an ice region using satellite data were discussed in Annex G, item 5.3.3. The Committee **recommends** that sensitivity analyses as to the position of the sea ice boundary on Antarctic minke whale abundances derived from aerial survey data be assessed before any in-depth calibrations and analyses of operational sea ice boundaries be attempted.

It is not possible to obtain reliable absolute abundance estimates of Antarctic minke whales in sea ice regions corresponding in space and time with IDCR/SOWER surveys. The Committee thus **recommends** that relatively simple analyses be conducted to generate abundances using aerial survey data. These abundances, with a range of potential availability biases, will help in producing an overall magnitude or upper bound on the numbers of Antarctic minke whales in sea ice regions during CPII and CPIII.

At present, the Committee is unable to exclude the possibility of a real decline in minke whale abundance between CPII and CPIII. Population dynamics analyses of catch-at-age data from Area IIIE to VIW (e.g. as in SC/64/IA1) can potentially account for the changes in overall abundance in terms of variations over time in mortality and recruitment. Such explanations are descriptive but they do not attempt to explain why, for example, recruitment might have dropped commencing in the 1970s. There is a second class of more mechanistic explanations concerned with, for example, why pregnancy rates might fall; this is where ecosystem effects, competition, climate, etc. would need to be considered.

As noted in Annex G, item 5.3.3, Murase and Kitakado suggested that the difference in abundance estimates between CPII and CPIII can (to a large extent) be attributed to process error (i.e. additional variance), reflecting a large inter-annual variation in distribution of the Antarctic minke whales (Kitakado and Okamura, 2009). However, they also suggested that systematic environmental changes observed in some areas do not alone account for the process error. Others suggested that the that JARPA and JARPA II data can assist the interpretation of the CPII and CPIII differences given the long time series data in Areas IIIE, IV, V and VIW (e.g see Matsuoka *et al.*, 2011). Hakamada will present information on some diagnostics from analyses to estimate minke whale abundance from JARPA next year.

In conclusion, the Committee noted that after many years work it had now been able to **agree** on estimates of minke whale abundance within the areas surveyed in CPII and CPIII. As yet, though, there was no conclusion on whether (and if so to what extent) these numbers indicate a real decline in abundance of Antarctic minke whales between the periods of the two surveys. Time constraints meant that it was possible to have only preliminary discussions of this question this year; discussions will continue at next year's meeting.

10.1.4 Continue development of the catch-at-age models

Population dynamics modelling provides a way to explore possible changes in abundance and carrying capacity within Areas IIIE-VW, where appropriate data are available. The inputs are catch, length, age, and sex data from the commercial harvests and both JARPA programmes, as well as abundance estimates from IDCR/SOWER. Early attempts used the ADAPT-VPA approach of Butterworth and Punt (1999), Butterworth *et al.* (2002) and Butterworth *et al.* (1996). A number of issues and concerns were raised with respect to that particular modelling framework for Antarctic minke whales, and it was concluded that an integrated statistical catch-at-age (SCAA) model was the most appropriate modelling framework (IWC, 2003c). Punt and Polacheck (2005; 2006) developed such a model and it has been refined over the last few years. The SCAA approach allows for errors in catch-at-age data, more than a single stock, time-varying growth, multiple areas, environmental covariates, fleet-specific vulnerabilities and changes over time in vulnerability. The technical problems and inconsistencies identified in previous years have largely been resolved (IWC, 2012l, p.180).

SC/64/IA1 provides a summary of the specifications of the current SCAA. The approach allows for multiple breeding stocks, which can be allowed to mix across several spatial strata on the summer feeding grounds where catches are taken. It also allows carrying capacity and the annual deviations in juvenile survival to vary over time. The model is fitted to length and conditional age-at-length data collected from the Japanese commercial and scientific permit catches, as well as indices of abundance from the IDCR/SOWER and JARPA/JARPA II cruises. The results provided in the paper are illustrative primarily because the IDCR/SOWER abundance estimates used had not been finalised, and the age-at-length data for recent years from JARPA II are not yet available.

As noted in Annex G, item 5.2, a number of suggestions for further work were made in this regard. Until now, application of the SCAA has been held up by the lack of agreed IDCR/SOWER abundance estimates, but that obstacle has now been removed, and the application of the SCAA in testing hypotheses concerning changes between CPII and CPIII abundance estimates has become a high-priority task. The time series of earplug age data, which is an important input that would improve the resolving power of the SCAA, has not been updated since 2004 or 2005 although samples are available through to 2011/12, because of difficulties in finding and validating age-readers. Preliminary age readings have been made from the 2006-08 samples, but have not yet been validated. Last year, the Committee had recommended that these preliminary data be made available and included in the SCAA on a provisional basis pending validation (IWC, 2012l, p.180). This year, the Committee **reiterates** this recommendation; the recent age data should be incorporated into the SCAA model as soon as possible. The Committee recommends the SCAA modellers request the new data via the Data Availability Group and the data owners provide it as soon as possible.

10.2. Southern Hemisphere humpback whales

The IWC Scientific Committee currently recognises seven humpback whale breeding stocks (BS) in the Southern Hemisphere (labelled A to G; IWC, 2011n), which are connected to feeding grounds in the Antarctic. An additional population that does not migrate to high latitudes is found in the Arabian Sea. Assessments of BSA (western South Atlantic), BSD (eastern Indian Ocean) and BSG (eastern South Pacific) were completed in 2006 (IWC, 2007d) although it was concluded that BSD might need to be re-assessed with BSE and BSF in light of mixing on the feeding grounds. An assessment for BSC (western Indian Ocean) was completed in 2009 (IWC, 2010f) and for BSB in 2011 (IWC, 2012m).

10.2.1 Begin assessment of breeding stocks D, E and F

Last year, the sub-committee on other Southern Hemisphere whale stocks initiated the re-assessment of BSD, and the assessment of BSE and BSF (IWC, 2012m). These stocks correspond, respectively, to humpback whales wintering off Western Australia (stock D), Eastern Australia (sub-stock E1) and the western Pacific Islands in Oceania including New Caledonia (sub-stock E2), Tonga (sub-stock E3) and French Polynesia (sub-stock F2) (Fig. 1). For simplicity the combination of BSE2, BSE3 and BSF2 will be referred to as Oceania.

10.2.1.1 ABUNDANCE, TRENDS AND POPULATION STRUCTURE

SC/64/SH6 presented a POPAN open model abundance estimate of 562 whales (CV=0.19, CI 351-772) from the New Caledonia humpback whale breeding ground (BSE2) using fluke photo-ID data collected over 16 years (1996-2011). Beginning in 2006 through to the current estimate, all population models examined show a trend of increasing abundance with a large 'pulse' after 2008. Whether these whales represent part of the New Caledonia sub-stock or permanent or temporary immigration from different regions is currently unclear.

In discussion, it was noted that a phenomenon similar to that observed in New Caledonia in the late 2000s had also been recorded off Eastern Australia in the late 1980s (Chaloupka *et al.*, 1999). To attempt to examine this apparent increase, the Committee noted that a possible movement of Eastern Australia whales to New Caledonia was consistent with an observed decrease in the rate of population growth of whales migrating off the Australian coast (Noad *et al.*, 2011) and levels of F_{ST} differentiation between E1 and E2 (0.01, Olavarría *et al.*, 2006) were the lowest among any pair of populations in Oceania. However, at this time the available data are not sufficient to explain the observed patterns.

Salgado Kent *et al.* (2012) provided new estimates of abundance and trends for Western Australian humpback whales. A number of statistical issues were raised in discussion as can be seen in Annex H. The Committee

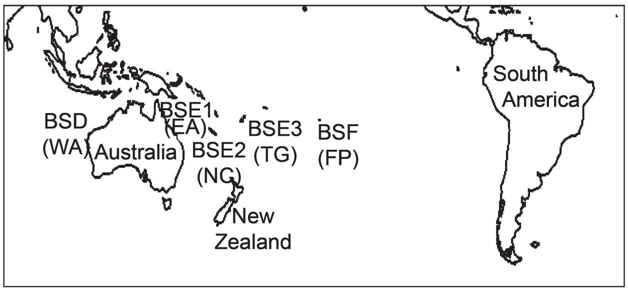

Fig 1. Distribution of Southern Hemisphere humpback whales breeding stocks grounds for BSD, BSE1, BSE2, BSE3 and BSF2 (WA = Western Australia, EA = Eastern Australia, NC = New Caledonia, TG = Tonga and FP = French Polynesia).

encourages further analyses and intersessional contact with the authors and that, if necessary they are invited to SC/65 for further discussion of their work.

SC/64/SH28 reported on the outcome of a Workshop held in November, 2011 to discuss future surveys and analyses of breeding stock D humpback whales at two locations off Western Australia - North West Cape and Shark Bay. The Workshop proposed a pilot survey to trial both cue-counting and racetrack aerial abundance survey methods, in conjunction with land-based work at both locations, to determine the most appropriate survey method for a full-scale absolute abundance survey in the near future. Prior to the survey, simulation work will be conducted to determine the operational protocols for the racetrack abundance estimation method as applied to humpback whales. The Committee **concurs** that a pilot study is the appropriate next step in method development for the provision of an absolute abundance for the Western Australian stock of humpback whales.

Four documents were available for discussion of stock structure issues, SC/64/SH5, SC/64/SH15, SC/64/SH22, and Pastene *et al.* (2011). These documents were reviewed by the Working Group on Stock Definition and their conclusions are reported in Annex I, item 3.1.1.

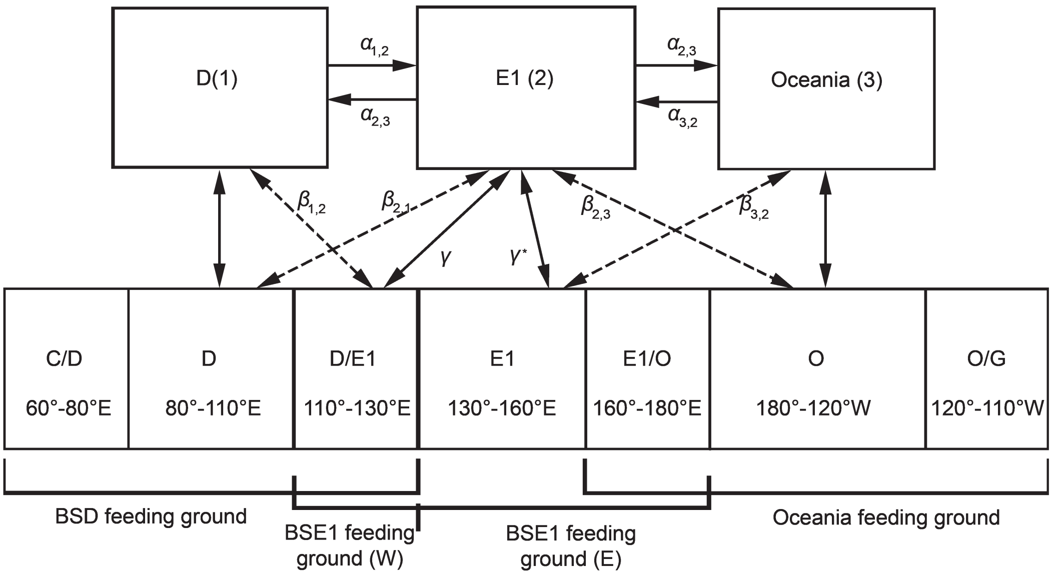

Fig. 2. Proposed model structure for breeding stocks D, E1 and Oceania. Arrows indicate possible interchange between stocks. These interchange rates will be estimated in the model, informed by data given in Table 1 of Annex H. Solid lines indicate movement of a breeding population to its own feeding ground, while dashed arrows indicate whales moving to a neighbouring feeding ground. Note that in order to avoid three breeding stocks mixing in the E1 feeding ground, an artificial boundary for catch allocation has been imposed. No catches taken east of this boundary will be allocated to BSD, while no catches taken west of the boundary will be allocated to Oceania. The longitude 130°E was chosen based on the longitudinal range of documented connections between BSD, Oceania and the Antarctic (J. Jackson, *pers. comm.*).

10.2.1.2 ASSESSMENT MODELS

In order to facilitate discussions and identification of further model runs, SC/64/SH29 provided initial results of population model fits to the Southern Hemisphere humpback whale breeding grounds D (West Australia; BSD), E1 (East Australia; BSE1) and Oceania (BSE2, BSE3, and BSF2). As anticipated, this led to considerable discussion and the details can be found in Annex H. As a result, the Committee **agrees** on a series of recommendations (details are in Annex H) regarding future work to facilitate the assessment:

(1) authors of some of the abundance estimates should be contacted to learn more about the estimates and how they might be incorporated into the assessment;
(2) a multinomial likelihood should be incorporated into the Bayesian population dynamics model;
(3) the new movement model structure (Fig. 2) should be incorporated to take into account the documented connectivity between breeding grounds in Western (D) and Eastern Australia (E1) and Oceania (E2+E3+F2) and between the breeding and feeding grounds;
(4) a two stock model for Eastern Australia and Oceania should be explored;
(5) catches should be allocated to the feeding areas associated with each of the three breeding stocks according to Hypothesis 1 of (IWC, 2010f);
(6) 'Discovery' mark data from the whaling period which contains information on movements between breeding grounds, between feeding grounds, and between breeding and feeding grounds, should be explored in the context of the assessments; and
(7) the Pastene *et al.* (2011) analysis on relative proportions of mixing in the feeding grounds should be expanded to include samples from Eastern Australia (E1).

The Committee also **endorses** the input data for the population dynamics model given in table 1 of Annex H and **agrees** that any additional datasets must be provided by 31 December 2012, after which time no more new data will be used for this assessment. The results of the analyses using the agreed model will be presented for discussion at the 2013 Annual Meeting. To ensure this work is completed, a work plan has been developed which identifies who will do each task (table 2 in Annex H) and an intersessional Working Group has been appointed, convened by Muller (Annex Q12). The Committee anticipates that the assessment of these stocks should be completed in 2014.

Reconciliation of the large photo-ID catalogue (6,500+ IDs from 1984-2011) held by Pacific Whale Foundation with existing catalogues from Western Australia, Oceania and the Antarctic Humpback Whale Catalogue is also encouraged to inform estimates of interchange for future assessments.

10.2.2 Review new information on other breeding stocks

10.2.2.1 BREEDING STOCK A

SC/64/SH17 reported 58 stranded humpback whales that were recorded between 1981 and 2011 off the coast of Rio de Janeiro, southeastern Brazil (annual mean 2.6, maximum 13 records in 2010). Reported strandings have increased over the past 20 years, which is consistent with the population increase observed for this stock. Three cases of entanglement were found (two were calves). Bacteriological agents in three live stranded whales assessed indicated evidence of animal impairment that resulted in or were associated with the cause of death.

The Committee **welcomes** this information but expressed concern that information is available from only a small part of the total Brazilian population. It **encourages** the provision of information from the full range of animals passing along the coast.

10.2.2.2 BREEDING STOCK B

SC/64/SH4 described a newly-discovered humpback whale wintering ground off northwest Africa with a seasonal signature consistent with a South Atlantic stock; the presence of adult/calf pairs suggests it may be a nursery ground. Since the observations were six months out of phase with the nearest (and only) known breeding ground in the northeast Atlantic – the Cape Verde Islands – these sightings possibly comprise the most northwestern component of the Southern Hemisphere BSB.

During a joint cruise organised by the South African Department of Environmental Affairs and the University of Pretoria in November 2011, a total of 107 biopsies were collected and numerous images obtained from humpback whales on the west coast of South Africa.

In discussion, numerous sightings of humpback whales have been made alone on the Atlantic African coast. The Committee **recommends** that the location and timing of all the existing Atlantic African records of distribution, seasonality and timing of sightings should be synthesised in a single map/database to show the extent of range and movements for humpback whales within a calendar year.

10.2.2.3 BREEDING STOCK C

SC/64/SH3 provided the first description of humpback whale movements between breeding grounds in the Comoros Islands and coastal western Madagascar. During 11-14 October 2011, five satellite transmitters were deployed on humpbacks off Moheli Island (12°24'S, 43°45'E) in the Comoros Archipelago. Three individuals were tracked successfully: mean tracking duration was 18 days (range 8-28 days); mean distance travelled was 467km (146-749km) and mean travelling speed 26.7 ± 22.3km/day. This is the first record of whales visiting different islands of the Comoros and western Madagascar in the same season.

Ersts *et al.* (2011) reported that between 1996 and 2006, nine whales (six males and three females) were identified using two breeding areas in separate years: the northern Mozambique Channel, currently the breeding region for sub-stock C2; and eastern Madagascar, currently a breeding region for sub-stock C3. This led the authors to believe that sub-stocks C2 and C3 were probably the same breeding sub-stock.

10.2.2.4 BREEDING STOCK D

Information was presented on examinations of eight neonatal humpback whales stranded on the Western Australian coast in 2011, all at least 1,000km south of the currently known major breeding grounds off the Western Australian northwest coast (see Annex H, item 2.3.4). Examinations indicated that all but one of the eight neonates was severely malnourished, and were believed to be non-viable from birth due to a lack of energy reserves and a compromised ability to thermoregulate and control buoyancy. Similar examinations are expected to be conducted on strandings on the Western Australian coast in 2012 and, hopefully, in future years.

10.2.2.5 BREEDING STOCK G

SC/64/SH16 provided information collected from whale-watching boats on distribution and behaviour of humpback whales from the south Pacific coast of Costa Rica, as discussed in Annex H, item 2.3.5.

In discussion, attention was drawn to the unusually high number of cow/calf pods reported together; nine groups with three or more adults with calves. The Committee **encourages** structured surveys to more completely document the distribution of these animals and **recommends** comparisons with catalogues from other areas, including breeding grounds, in the Southern Hemisphere.

SC/64/SH23 presented information on 1,580 individually photographed humpback whales off Ecuador that were compared with 611 animals identified in the southeast Pacific in four different catalogues. This confirmed Antarctica as the main feeding ground for humpback whales found off Ecuador and suggested that feeding areas for whales identified off Ecuador may extend as far east within Area II as the South Orkney Islands. The Committee was also informed that individual animals may migrate either to the Magellan Strait or the Antarctic Peninsula, but not to both. Comparison with the catalogue of animals found off Chiloe Island, Chile, had yet to be undertaken, and the Committee **recommends** that this comparison be undertaken and looks forward to receiving further information.

Information on 15 long-term resightings of humpback whales off Ecuador was reported in SC/64/SH24. One animal was resighted over a 26 year time span. The paper also provided the earliest connection from Ecuador to Antarctica and further supports the findings that waters around the Antarctic Peninsula are the main feeding area of humpback whales migrating to Ecuadorian waters. The Committee **endorses** plans to extend comparison of the Ecuadorian catalogue with animals from around South Georgia and Area II and looks forward to receiving a report at next year's meeting.

SC/64/O15 discussed observations from small boats during 2006-12, within the Golfo Duce, Costa Rica and the surrounding area of Osa Peninsula. It was shown the area is an important wintering ground, where the whales' distribution was determined by bathymetry, water temperature and possibly currents. For example, whales seem actively to avoid areas with eddies. The area seems to be used mainly by singing adults and there were competitive groups present in depths less than 60m, suggesting that mating occurs there.

The Committee **endorses** the view that spatial distribution information obtained from this study should be taken into account in establishing guidelines for appropriate management of this important Costa Rican marine coastal habitat.

10.2.2.6 FEEDING GROUNDS

SC/64/SH21 presented new information about abundance, population structure, demographic, and reproductive trends of humpback whales from the Strait of Magellan feeding area using long-term data on sightings, photo-ID and molecular analysis. The waters of Chilean Patagonian fjords and the Strait of Magellan remain today as the only recorded Southern Hemisphere feeding area for humpback whales of breeding stock G outside Antarctic waters.

The Committee thanked the authors for bringing this new information forward. It noted that it could not fully evaluate the abundance estimates with the information provided in the document and looked forward to seeing additional documentation next year. The Committee **expresses concern** regarding the potential for ship strikes and habitat displacement if the coal mining development results in a substantial increase of ship traffic in the region. It **recommends** that potential impacts are carefully assessed and that effective mitigation measures are adopted where necessary.

10.2.2.7 ANTARCTIC HUMPBACK WHALE CATALOGUE

SC/64/SH1 provided an update on the Antarctic Humpback Whale Catalogue (AHWC). The recent submissions bring the total number of catalogued whales identified by fluke, right dorsal fin/flank and left dorsal fin/flank photographs to 4,635, 414 and 409, respectively. Opportunistic data represent a significant portion of the AHWC. Progress continues in efforts to stimulate submission of opportunistic data from eco-tourism cruise ships in the Southern Ocean and from research organisations and expeditions working throughout this region and the Southern Hemisphere.

The Committee thanked the authors for their hard work and **recommends** that the AHWC continue. This item has financial implications as discussed under Item 23.

10.2.3 Work plan

The work plan for the assessment of Southern Hemisphere humpback whales is described in table 2 of Annex H and will be furthered by an intersessional Working Group (Annex Q12). The Committee's discussions of the work plan are discussed under Item 21 and financial implications under Item 23.

10.3. Southern Hemisphere blue whales

10.3.1 Review new information

10.3.1.1 PHOTO-ID CATALOGUES

SC/64/SH8 provided an update on the Antarctic Blue Whale Photo-ID Catalogue (ABWPIC), which includes photographs collected during 20 years of IWC IDCR/SOWER cruises (1987/88 to 2009/10). In 2011 and 2012 the photographs of eight new whales and one re-sighted whale (2007-10) were added. Currently the catalogue contains a total of 227 identified whales. Seven whales were re-sighted in multiple years. Mark-recapture analysis of Area III in the 3-year time period 2004/05-2006/07 yielded estimates of abundance ranging from 818 to 1,097 whales.

The Committee welcomed this update and recognised that the data have also been submitted to the Southern Hemisphere Blue Whale Catalogue. Photographs of blue whales from the JARPA programme has not yet been included in the ABWPIC but have been submitted to the IWC Secretariat. The Committee **reiterates** that the photographs should be added to the catalogue and reconciled and a proposal to achieve this has been developed. This is discussed further under Item 23.

SC/64/SH20 presented an update on the Southern Hemisphere Blue Whale Catalogue that holds photo-ID catalogues of research projects from major areas off Antarctica, Eastern South Pacific and the Eastern Tropical Pacific (ETP). A total of 822 and 826 individual blue whales photographed from left and right sides respectively are held in this Catalogue. Left-side comparisons have been completed and right-side comparisons are underway for ETP and the other areas. There are re-sightings both within Chile and in the Southern Ocean. However, none of the 84 whales photographed off ETP have been re-sighted within or outside of the ETP.

The Committee **encourages** contributions of regional catalogues not yet in the Southern Hemisphere Blue Whale Catalogue (e.g. eastern and western Australia) to facilitate full reconciliation of the catalogue for the Southern Hemisphere blue whales and a proposal to achieve this has been developed. This is discussed under Item 23.

10.3.1.2 ANTARCTIC BLUE WHALES

SC/64/SH14 reported methodological developments for estimating relative abundance from historic Antarctic whaling records using catch per unit effort data (CPUE). Once the work has been completed and accepted by the Scientific Committee, the Committee welcomed the commitment of the authors to submit the datasets and script to the IWC Secretariat.

SC/64/SH11 summarised two voyages conducted by the Australian Antarctic Division off southeastern Australia to refine acoustic tracking methodologies to address the aims of the Southern Ocean Research Partnership's Antarctic Blue Whale Project (see Item 19 and Annex H, item 3.1.2.1). The primary aim of this project is to estimate the circumpolar abundance of Antarctic blue whales using mark-recapture methods. The passive acoustic tracking system, using DIFAR sonobuoys, operated continuously during the voyages recording nearly 500 hours of audio, while acousticians processed over 7,000 blue whale calls in 'real-time'. The two voyages yielded 52 sightings (104 animals) of blue or like-blue whales; 48 animals were identified photographically (one on both voyages). Some blue whales that had been seen were not heard.

SC/64/SH12 summarised the methodological development of the use of DIFAR sonobouys for real-time tracking of blue whales. The results indicate that acoustic surveys may offer increased effective range over purely visual surveys of blue whales.

SC/64/SH26 presented an exploration into what encounter rates are plausible using acoustic-assisted tracking of whales, as opposed to a traditional visual-only survey (such as IDCR/SOWER). Given the lack of data, and the number of assumptions, abstractions, and approximations required in this simulation exercise, the authors stressed that the estimates in the paper should not be considered accurate or precise.

SC/64/SH10 presented a great advancement on the feasibility study of methods to obtain a new estimate of circumpolar abundance of Antarctic blue whales. Using the seasonality and location of sightings and acoustic detections from IWC-SOWER surveys, and historical catch data, it was concluded mark-recapture surveys should target putative hotspots and make use of passive acoustic tracking to increase encounter rates. With a reasonable level of effort a viable estimate of circumpolar abundance could be obtained for Antarctic blue whales within a ten-year period (and see Item 19).

The Committee recognises that the longer-term timeline to estimate abundance of Antarctic blue whales is more appropriate and logistically more feasible than the shorter periods considered earlier in the project's development. It **welcomes** the suite of papers linked to the Antarctic Blue Whale Project and the considerable advancement in the project's development. Further mark-recapture simulation studies may be valuable to investigate the effects of variability in effort between years within the suggested ten year timeframe and also to investigate the interaction between spatial variability in effort and possible population structure. This simulation could assess the consequences of only targeting 'hotspots' and the potential heterogeneity in capture probability potentially generated through this approach.

Further the Committee **encourages** ships contributing to the ABWP to, whenever possible, also collect environmental data for habitat modelling and data on other whale species sighted. In some circumstances environmental data can be collected through remote sensing but this is often problematic around Antarctica due to extensive cloud cover. Gliders and floats may provide another opportunity to collect high resolution water column data.

10.3.1.3 PLANNING OF FUTURE RESEARCH

The Committee was pleased to receive a number of papers on future blue whale research (see Annex H, item 3.1.2.2 for full discussion of these).

SC/64/SH13 presented a preliminary plan for an Australian funded voyage to contribute to the SORP Antarctic Blue Whale Project. The aim of the Antarctic Blue Whale Project is to develop technologies and collect data that will ultimately deliver a new circumpolar abundance estimate for Antarctic blue whales. The voyage will focus on blue whales in waters west of the Ross Sea (i.e. 135-175°E), an area that has been associated with higher densities of blue whales. The plan will be further developed and reviewed once the project management structure for the Antarctic Blue Whale Project is established which includes the formation of technical committees on passive acoustics, individual identification, and survey design.

The Committee **emphasises** the importance of collecting opportunistic data on other whales (sightings, faecal collection, biopsies) and environmental data, while recognising the value of clear priorities, particularly when the number of days 'on-site' in good weather can be few, even for longer Antarctic voyages.

SC/64/O16 presented the South African Blue Whale Project which is intended to initiate a long-term monitoring programme of blue whales in the Antarctic sector east of the Greenwich meridian, coupled with investigations of their seasonal pattern of abundance at lower latitudes. Acoustic technology will be combined with traditional line transect sighting survey and mark-recapture methodology to study the distribution, abundance and movements of blue whales in the southeast Atlantic. This joint study is conducted by the University of Pretoria and the University of Washington, and has received funding for 3 years from the South African National Antarctic Programme, starting in 2012/13. One team member will receive training in AAR deployment during a cruise off Greenland this summer (SC/64/O17) under the SORP programme. Although data valuable to the SORP Antarctic Blue Whale Project will be collected on this voyage (photo-ID and biopsy samples), the project is more closely linked with another SORP project 'Acoustic trends in abundance distribution and seasonal presence of Antarctic blue whales and fin whales in the Southern Ocean (see SC/64/O13).

SC/64/SH25 proposed a project on the genetics of Antarctic blue whales in part using IWC samples. The contemporary Antarctic blue whale has been described by a relatively high mitochondrial DNA (mtDNA) haplotype diversity, and may have escaped a greater loss of genetic diversity due to its long life span, overlapping generations and the brief period of the bottleneck. The impact of 20th century commercial whaling on genetic diversity can be explored through a comparison of historic and contemporary genetic diversity. The Committee **recommends** that access to the samples continues for this work and encourages further sampling in South Georgia.

The Committee **endorses** these research projects and looks forward to reviewing the results.

10.3.1.4 PYGMY BLUE WHALES

SC/64/SH27 presented a study on the identity of blue whales that are regularly sighted in the Geographe Bay region of Western Australia. Preliminary results based on measures of genetic structure indicate that the whales were all of the pygmy subspecies. Further samples from Geographe Bay are required to clarify whether these blue whales have fine scale genetic differentiation.

The Committee **welcomes** this paper which is discussed fully in Annex H, item 3.1.3, noting the contribution made by IDCR/SOWER samples to the study.

10.3.1.5 CHILEAN BLUE WHALES
The Committee was pleased to receive three papers on blue whales in Chilean waters and a full discussion can be found in Annex H, item 3.1.4.

Galletti Vernazzani *et al.* (2012) described the results of a collaborative research programme (the Alfaguara Project) conducted by Centro de Conservacion Cetacea on Chilean blue whales. From 2004 to 2010, eight aerial and 85 marine surveys were conducted off Isla de Chiloe, southern Chile, where a total of 363 individual blue whales were photo-identified. Recapture data support the hypothesis that the feeding ground off southern Chile is extensive and dynamic. Blue whale distribution off southern Chile was assessed and relative abundance, using sighting per unit effort and kernel density estimators was obtained.

SC/64/SH18 provided an update on the 2012 blue whale field season that reported the occurrence of a shift in blue whale distribution during 2012 from the southern Chile feeding area (Isla de Chiloe), as reported in previous years, to an additional feeding aggregation of blue whales in northern Chile (Isla de Chanaral). The Committee recognised the value of such long-term datasets for understanding blue whale populations and **recommends** that they continue.

SC/64/SH19 presented an abundance estimate of Chilean blue whales by mark-recapture and line-transect techniques.

The Committee recognised that the area covered by the line-transect survey does not include the entire range of the population and so will underestimate the total population size. There are also issues related to possible structure among feeding groups and sampling that require further consideration with respect to mark-recapture estimation. The Committee **encourages** further work on this and looks forward to receiving additional analyses.

10.4 Western North Pacific gray whales
10.4.1 New scientific information
Results regarding mixing of western (WNP) and eastern (ENP) North Pacific gray whales illustrate the great conservation and management importance of a more comprehensive examination of gray whale movement patterns and population structure in the North Pacific. At last year's meeting the Committee noted that for such an effort to be successful it must be international and collaborative (Weller *et al.*, 2012). To facilitate this, and noting the existing safeguards for collaborators provided under the Committee's Data Availability Agreement, it recommended that a collaborative Pacific-wide study be developed under the auspices of the IWC, recognising that *inter alia* this will contribute to the Committee-endorsed Conservation Plan for Western North Pacific Gray Whales and incorporate previous recommendations made by the Committee. Appendix 7 of Annex F provides an update on progress made to date.

The Committee **commends** the highly collaborative, international research effort for the progress made to date and look forward to future updates. The Committee also received several papers on stock structure and movements of north Pacific gray whales that resulted from this or other related programmes. Details can be found in Annex F, Item 4.1.

10.4.1.1 SATELLITE TAGGING
Mate summarised results regarding the recent collaborative efforts between Russian and US scientists to satellite track western gray whales under a programme undertaken with guidance from the IWC Scientific Committee and the IUCN WGWAP (Western Gray Whale Advisory Panel). The main goal of the project was to determine migration routes and breeding areas of tagged gray whales from the western North Pacific in order to develop improved conservation measures for this very small population. A total of seven whales were tagged in 2010 and 2011. The three longest tracked whales moved east across the Bering Sea and into the northeast Pacific where they overlapped with the range of eastern gray whales. Each animal followed a different route. The transmitter for a whale tagged in 2011 has lasted almost a year and continues to transmit. It travelled to near the southern tip of Baja California, Mexico during the winter and returned to near Sakhalin Island, Russia this spring. The autumn and spring migratory routes differed. These results, along with those from photo-ID matches from the eastern and western Pacific have caused the Committee to examine overall stock structure of gray whales in the North Pacific and to initiate the ocean wide research programme referred to above.

Mate also presented information on a plan for the A.N. Severtsov Institute of Ecology and Evolution of the Russian Academy of Science (IPEE) and Marine Mammal Institute of the Oregon State University to continue tagging western gray whales following the guidelines already developed by the IWC (IWC, 2012k). It is intended to tag up to 20 animals off Kamchatka (there is some interchange between animals off Kamchatka and Sakhalin) beginning in early July. The objective is to provide additional information on stock structure and to assist in developing conservation measures. The programme will also involve photo-ID and biopsy work. Photos will be made available to all catalogues and genetic samples will again be submitted to the IWC archive.

There was some discussion about whether tagging in Kamchatka was as beneficial as further tagging off Sakhalin as detailed in Annex F. The Committee **agrees** on the value of future telemetry work off Kamchatka and Sakhalin and **reiterates** its previous guidelines for such work (IWC, 2012k). Advice from the IWC/IUCN Steering Group chaired by Donovan on the full proposal will be provided to the research team in sufficient time to assist preparations for the field programme. The Committee also **recommends** that an evaluation of healing of the wounds caused by the satellite tags be undertaken and provided at next year's meeting.

The Committee also received information on plans for telemetry work on eastern gray whales. Quakenbush and her colleagues plan to tag up to 10 gray whales near Barrow and Saint Lawrence Island in 2012. The main goal is to document the distribution, movements, and feeding areas of gray whales relative to oil and gas activities in the Chukchi Sea. The project will include the collection of photographs and biopsies. Data will be shared with other gray whale research groups. Mate plans to tag some additional PCFG gray whales in 2012 in Oregon and northern California. The objective is to investigate if the variable migratory timing, routes, and Baja California destinations are similar to those found in 2009 and 2010.

10.4.1.2 PHOTO-IDENTIFICATION
SC/64/BRG13 provided results from a photographic comparison of gray whales off Sakhalin Island, Russia with animals in lagoons of Baja California, Mexico. Additional information about another match was reported subsequent to the submission of SC/64/BRG13. In total, photographs of 217 identified gray whales were obtained from the Sakhalin Island feeding grounds and compared with 6,546 photo-

identified individuals from the Baja California breeding lagoons. The research team found a total of 14 matches from the 217 Sakhalin whales, including six males, six females and two animals of unknown sex. Thirteen whales had sightings in Russia prior to and after their respective sighting in Mexico. Five females with calves were sighted in the winter in Mexican waters and in the next summer off Sakhalin, three of them without calves suggesting that these females had either separated from their calves or that their calves did not survive. The matches made between whales sighted off Sakhalin and the Mexican Pacific are the first results of the multinational collaboration.

The Committee **thanks** the authors and their colleagues for reconciling the Mexican photo catalogue. This will be a useful tool to address many questions, such as the relationship between Sakhalin and Mexico gray whales. The Committee also **acknowledges** the collaboration among the international group of gray whale researchers as a great example of how scientists can work together to address questions of great importance.

Another example of the multinational collaboration involves the photo comparisons being conducted among three catalogues: the Russia-US Sakhalin catalogue; the Institute of Marine Biology (IBM) Sakhalin catalogue; and the IBM Kamchatka catalogue (Appendix 9 of Annex F presents preliminary results from this study).

Updated information on research and conservation in Japan was presented in SC/64/O8. In March 2012, a gray whale was sighted on the Pacific coast of Aichi Prefecture, in the middle of Japan and some photographs of the animal were taken. No stranding or entanglement of this animal occurred. The Committee was also informed that there are some photographs (and genetic samples) in Japan that might contribute to a better understanding of stock structure of north Pacific gray whales. Japan expressed interest in joining the international collaboration and named Kato as the contact person. The Committee welcomes this news and **encourages** sharing of photographs and genetic samples with existing catalogues and genetic databases.

The Committee **commends** the above highly collaborative, international research effort for the progress made to date and **encourages** enhanced collaboration, if at all possible. The Committee **strongly recommends** the continuation of the IWC collaborative programme as outlined in Annex F, especially the plans to collect additional biopsy samples for genetic comparisons and photographs for catalogue comparisons. It was suggested that analyses be conducted to assess whether any patterns in the genetic data could be identified when Sakhalin whales known to have overwintered in the Eastern North Pacific are compared to the other sampled animals off Sakhalin as well as to those sampled in the Eastern North Pacific. The Committee also **recommends** that existing data be used to attempt to estimate the proportion of animals that regularly feed off Sakhalin and also migrate to the eastern North Pacific in the winter.

10.4.1.3 OTHER

SC/64/BRG10 provided a summary of past and current records of gray whales off the coasts of Japan, China and Korea. There are only 13 known sighting or stranding records in Japanese waters between 1990 and 2007 (Nambu *et al.*, 2003). Observations of gray whales in China are also exceptionally rare. Gray whales were once common and hunted off the coast of the Korean Peninsula but the last reported commercial catches were in 1966 and the last known sighting off Korea was in 1977. This suggests that they have abandoned the migration corridor along the Korean Peninsula or that a subpopulation using the Korean Peninsula is now extinct. The evidence that some Sakhalin animals migrate to the west coast of North America during the winter/spring, along with observations off Japan, Korea and China during the winter/spring, in combination with significant genetic differences between the eastern and western populations (Lang *et al.*, 2011) suggest that the number of whales in the western North Pacific population is potentially smaller than the currently estimated ~150 whales that use the Sakhalin summer feeding area.

This paper stimulated considerable discussion as can be seen in Annex F. The Committee emphasises the importance of the collaborative oceanwide programme and the need to review stock structure of gray whales throughout the North Pacific. It was noted that photographs (albeit low quality) of a gray whale that died in fishing gear in China in November 2011 have been compared with several catalogues (i.e. the Russia-US, IBM Sakhalin, and IBM Kamchatka) but no matches have been made.

In conclusion, the Committee **welcomes** all of the information on this critically endangered population and the broader question of stock structure. It **encourages** further work and as in previous years, **re-emphasises** the importance of continued long-term monitoring. Recognising some difficulties of interpretation given the new information on movements, the Committee also **encourages** Cooke to complete and publish his assessment of the gray whales feeding off Sakhalin using the combined photo-ID datasets. This rich dataset can provide valuable information for assessing possible anthropogenic impacts on animals feeding in the area.

10.4.2 Conservation advice

As in previous years, the Committee **acknowledges** the important work of the IUCN Western Gray Whales Advisory Panel. This year's update on the panel's activities is given in Appendix 10 of Annex F. The Committee **re-emphasises** its view of the importance of the Panel's work and reiterates its support. Furthermore, the Committee **recommends** that appropriate monitoring and mitigation plans be implemented for all oil and gas activities that occur in the range of western gray whales, especially if another platform is to be built or installed off Sakhalin.

The Committee again **recognises** that the problem of net entrapment of western gray whales is a range-wide issue. It **welcomes** Japan's administrative actions related to conservation of gray whales (SC/64/O8) and the efforts of other range states to reduce mortality, such as net entrapments that occur in other range states, including Canada, the USA and Mexico on the eastern side of the Pacific. Continued international collaboration to elucidate population identity and stock structure, as emphasised above, will provide valuable information for future management advice.

10.5 Southern Hemisphere right whales

10.5.1 Review report from intersessional Workshop

Bannister introduced the report of Workshop, held in Buenos Aires, Argentina, from 13-16 September 2011 (see SC/64/Rep5). He noted that although substantial progress had been made on much of the agenda, additional work was needed on some sections, especially the completion of analyses related to abundance and assessment. It was also noted that subsequent revisions of some analyses meant that sections of the report required clarification or amendment. As a consequence, two groups (an assessment group and a drafting group) were established to complete this work.

The Committee recognises the substantial work undertaken at the Workshop and **welcomes** the report, thanking particularly the Chair, rapporteurs and the host. It noted the large number of recommendations the report contained and prepared the following consolidated version incorporating additional comments and recommendations from the Committee as appropriate.

10.5.1.1 LONG-TERM POPULATION MONITORING

The Committee has long recognised the value of long time-series in informing, prioritising and evaluating conservation and management actions for whales, including monitoring the effectiveness of mitigation measures and Conservation Management Plans. In particular, it stresses the value of maintaining annual data sets, especially those that include information on the calving intervals of individual females, for their potential importance in analysing the influences of climate and environmental variables on southern right whale reproduction. The Committee therefore **strongly recommends** that all existing southern right whale data sets of this nature (e.g. in Argentina, Australia and South Africa) be continued on an annual basis and that similar programmes be established wherever possible for other areas.

In this connection, the Committee received a proposal requesting interim relief funding for the 2012 aerial survey off South Africa (Annex F, Appendix 2) and **recommends** its support (see Item 23). In addition, the Committee **recommends** that the annual CENPAT programme of aerial surveys around Península Valdés, which is independent of the long-term aerial photo-ID programme and substantially increases the areal and temporal survey coverage, should be continued on an annual basis.

10.5.1.2 POPULATION STRUCTURE AND LINKAGES

The population structure and stock identity of southern right whales remain incompletely described. A particular challenge is to distinguish adjacent stocks with different demographic histories and apparent rates of recovery. To address this, the Committee **recommends** that a circumpolar collaboration proceed to assemble standard genetic information from all available samples (see SC/64/Rep5, table 5), that could *inter alia* update the previous analysis by Patenaude *et al.* (2007) of the genetic structure of southern right whales on their calving/nursery grounds.

A number of standard genetics protocols are **recommended,** including standardisation of mtDNA preparation and nomenclature, standardisation of microsatellite loci and the exchange of samples between laboratories to establish allelic standards and provide quality control (see SC/64/Rep5). Further tissue sampling is also **strongly recommended** in a number of areas including Australia, Chile/Peru, Southern Africa and Brazil (see Annex F and SC/64/Rep5 for more details). In addition, to investigate relationships with other southern populations, further analysis of existing genetic samples from South Africa (n=~600) is **recommended**.

Recognising the importance of being able to allocate offshore ('pelagic') catches in the Southern Ocean and in low-latitude areas to the appropriate calving/nursery/breeding grounds, the Committee **recommends** that genetic (biopsy), photo-ID and satellite tagging data are applied to identify linkages. Further investigation is **recommended** of: (a) connections between whales in the New Zealand sub-Antarctic and those in mainland New Zealand; and (b) philopatry to mainland New Zealand (for details see Annex F and SC/64/Rep3). It is also **recommended** that biopsy samples, satellite tagging data and photo-ID data be linked, where possible.

While recognising the value of genetic analyses in solving the problems of population structure and linkages, the Committee also **recommends** other approaches such as inter-catalogue comparisons. Similarly, the value of strategically deployed satellite tags in depicting movements has already been demonstrated for southern right whales, and the Committee **recommends** that such studies continue.

10.5.1.3 MODELLING

The Committee **recommends** further investigation of the conversion factor used to estimate total population size from the estimated adult female component. Such investigation needs to consider that there has been only a relatively short period of recovery and that therefore the age distribution is unlikely to be steady and the estimated survival rate is likely to be biased upwards from the average that would apply in a steady situation.

10.5.1.4 JOINT ARGENTINA/BRAZIL ASSESSMENT

Noting the preliminary nature of Cooke's analyses, the Workshop had decided not to append the results to their report. It had recommended that progress towards the 'joint assessment', using data from both Argentina and Brazil, be made as quickly as possible and that an update also be presented on this work at the 2012 Scientific Committee meeting. Cooke provided an assessment of the 2010 Argentine population including a rate of increase from 2000-10 to the meeting (Annex F, Appendix 3). The Committee **welcomes** this and **agrees** to include the results in the Workshop's assessment of the status of the southern right whale population in 2009, appreciating that until a joint Argentine/Brazilian assessment had been completed these results must be considered preliminary in nature. The Committee **recommends** that the joint Argentine/Brazilian assessment be completed as soon as possible, and the results presented to the 2013 Annual Meeting.

10.5.1.5 ASSESSMENT OF THE CHILE/PERU POPULATION

In order to obtain information on the distribution and abundance of this Critically Endangered population, to clarify its status and identify any threats and possible mitigation actions, the Committee **recommends** that surveys, photo-ID and genetic studies should be conducted as a priority. Specifically, the following steps should be taken:

(1) determine geographical/temporal areas where quantitative studies can best be conducted, through analysis of existing historical whaling and sighting data and appropriate temporal/geographical spatial modelling;
(2) design a systematic survey programme (aerial surveys may be the most efficient) to cover potential calving or nursery areas, bearing in mind logistical and practical limitations; and
(3) further consider stock structure issues by examining existing genetic samples (including museum specimens where possible) and collect new samples in southern Chile/Argentina.

10.5.1.6 IDENTIFICATION OF CONCERNS AND THEIR MONITORING

Given that there was evidence of continuing direct removals via entanglements in fishing gear and ship strikes, the Committee **recommends** all countries to include reports of ship strikes and entanglement events in their annual Progress Reports to the IWC through the new online portal (see Item 3.2).

The Committee **strongly reiterates** the research and management recommendations made at the Workshop on the Southern Right Whale Die-off (IWC, 2011k). In addition, in view of the severe impacts of gull attacks documented at Península Valdés and the risk that this learned behaviour on the part of gulls could proliferate, the Committee **recommends** that Brazilian authorities consider taking immediate action if and when similar gull behaviour is observed. Some members felt that this action should specifically include the removal of attacking gulls, following similar steps being undertaken by Argentina in the Península Valdés area.

The Committee noted that some concerns have been raised about the potential effects of fishing and climate change on krill and hence on krill predators. The Committee also noted that the CCAMLR Scientific Committee was investigating these matters and encourages further collaboration between IWC and CCAMLR on the development of relevant ecosystem models.

10.5.1.7 DEVELOPMENT OF CONSERVATION MANAGEMENT PLANS (CMPS)

The Committee **recommends** that any draft CMPs take into account the recommendations made at the Buenos Aires Workshop and the Workshop on the Southern Right Whale Die-off and use these as the basis of action development (IWC, 2011k). The Committee was pleased to note that this was the case for the two draft CMPs it received (see below).

10.5.1.8 CONCLUSION

The Committee noted that the Workshop Report (SC/64/Rep5) had reached conclusions on the current status of the overall Southern Hemisphere right whale population based on a modelling exercise undertaken during the Workshop using the best available parameter values. However, the Workshop had recognised that the calculations were very dependent on: (1) the results of the as yet incomplete analysis of the Argentinian/Brazilian population to be provided by Cooke; and (2) on different conversion factors from mature female to total population size derived from the Argentine and South African populations.

Cooke advised that the parameter values for Argentina he had provided during this meeting (Annex F, Appendix 3) still required some updating. However, he agreed that he would forward them by 1 July 2012 to Butterworth and his colleagues so that a revised circumpolar analysis using the same approach as in Buenos Aires could be completed. It was agreed that the updated analysis would be incorporated into the Buenos Aires Workshop report with an appropriate editorial note. This full report would then be circulated to Workshop participants for any final comments and included in the published version in the *Supplement* to *J. Cetacean Res. Manage.*.

Cooke reported that it was impossible to undertake the recommended joint Argentina/Brazilian assessment until matching between photo-ID catalogues had been completed. However, he confirmed that excluding Brazil from the overall assessment was unlikely to have a major effect on the resultant circumpolar estimate because of its relatively small size (some other small populations for which no estimates exist are also excluded from the assessment). It was also noted that updated calculations using the Argentina and South African data had resulted in a convergence of conversion factors (Annex F, Appendix 3) so that these are no longer a major issue in estimating total population size for use in the assessment.

10.5.2 Review new information

10.5.2.1 SOUTHWEST ATLANTIC

The Committee received three papers on this population. They are briefly summarised below but a full discussion can be found in Annex F, item 3.3.2.

SC/64/BRG12 presented updated information on the southern right whale die-offs at Península Valdés, Argentina for the 2010/11 seasons. Systematic efforts to study the strandings have continued since 2003. A total of 482 dead whales were recorded at Península Valdés between 2003 and 2011. At least 55 whales died in 2010 and 61 died in 2011. As in previous years, the vast majority of strandings were calves of the season.

SC/64/BRG7 reported an analysis of metal levels in the skin of living southern right whales at Península Valdés, Argentina, as part of efforts to investigate the recent die-offs. The levels of non-essential and essential metals in the skin of 10 animals were on the low end of the spectrum of measured concentrations when compared to other studies. The authors cautioned that these low levels should not necessarily be interpreted as being safe since the effects of metals in marine mammals are largely unknown.

There was lengthy discussion on the possible reasons for changes in the observed calving interval. In conclusion, the Committee **reiterates** the recommendations of the southern right whale die-off Workshop (IWC, 2011k) and **encourages** the continuation of the studies presented in SC/64/BRG7 and SC/64/BRG12 to better understand the mechanism(s) behind the observed mortality.

SC/64/BRG20 presented an abundance estimate of southern right whales by aerial line-transect surveys for a bay area of Bahía San Antonio, Argentina, from late summer to autumn in 2009-11. A corrected abundance estimate using $g(0)$ is 207 (CI=99-315) in 2010, which is the maximum among the three years. These aerial surveys resulted in the first specific estimates of southern right whale abundance in this north Patagonian bay although more consistent aerial surveys should be conducted.

10.5.2.2 SOUTHERN AFRICA

SC/64/BRG24rev applied the three-mature-stages (receptive, calving and resting) model of Cooke *et al.* (2003) to photo-ID data available from 1979 to 2010 for southern right whales in South African waters. The 2010 mature female population is estimated to be 1,309, the total population is 4,725, and the annual population growth rate 6.8%. Information from re-sightings of grey blazed calves as adults with calves allows estimation of first year survival rate of 0.914 and an age at 50% maturity of 6.4 years. In contrast, the relative proportions of grey blazed animals amongst calves and amongst calving adults suggest rather a value of 10% (SE 8%). If the proportion losing markings is in fact 10%, first year survival rates estimate drops to [0.859] and the population growth rate to [6.6%] per year.

Best presented an analysis in which he had assembled data from foetuses, biopsied calves and stranded calves to test the assumption that the neonatal sex-ratio in southern right whales was 50:50. The most appropriate data set suggested a ratio closer to 46 male:54 female (Annex F, Appendix 4). The base case model of SC/64/BRG24 with this alternative sex ratio of 54:46 resulted in the total population 4,359 (Annex F, Appendix 5). The main differences in the parameter estimates were a lower first year survival rate with a corresponding higher value of the estimate for the probability that a grey-blazed calf maintains its markings until becoming an adult.

10.5.2.3 SOUTHWEST PACIFIC AND NEW ZEALAND

Carroll (2012) provided results on paternity assignment and 'gametic recapture' to examine the reproductive autonomy of southern right whales on their New Zealand calving grounds. The 'gametic mark-recapture' estimate of male abundance was 1,001, directly comparable with the 'census estimate' of male abundance, n=1,085, for the stock, based on standard genotype mark-recapture modelling. Simulations indicated the assumption of equal reproductive success amongst males was not violated. Power analyses suggested that these findings would be highly unlikely if the population was open to gene flow from other, larger populations in the Indo-Pacific region. The authors concluded that these findings are consistent with the hypothesis that southern right whales returning to the New Zealand calving ground are reproductively autonomous on a generational timescale, as well as isolated by maternal fidelity on an evolutionary timescale.

10.5.2.4 AUSTRALIA
SC/64/ProgRepAustralia provides information on southern right whales obtained on survey flights off the southern Australian coast between Cape Leeuwin and Ceduna in August 2011. The most recent updated increase rate for this Australian 'southwest stock' for 1993-2011 is 6.82% for all animals (CI 4.24-9.47), and 7.21% for cow/calf pairs (CI 3.70-10.85) with current population size *ca* 2,900; including the much smaller 'south east' Australian stock, the Australian population as a whole is likely to number *ca* 3,500.

10.5.2.5 SOUTH EAST PACIFIC RIGHT WHALES
Off northwestern Isla de Chiloe, four sightings of the critically endangered Chile/Peru 'sub-population' between September and November 2011 were documented, including the first incidence of reproductive behaviour and the first resighting of a known individual in Chile. In addition, some 30km north, the southernmost record of a mother-calf pair was recorded. These observations suggest that northwestern Isla de Chiloe is part of a breeding area with undetermined boundaries. This highlights the importance of these coastal waters and the need to continue long-term studies, both dedicated and opportunistic, to monitor this critically endangered population.

10.5.2.6 GENETIC RESEARCH
SC/64/BRG15 reported on progress with the investigation of the worldwide genomic diversity and divergence of right whales. Through collaborative agreements, the investigators have obtained representative samples from all three oceanic species. The investigators have used next-generation sequencing technology to develop genomic profiles by sequencing the complete mitochondrial genomes and multiple nuclear genes for each individual. To date, the results provide greatly increased resolution of the divergence between the three recognised species, and the diversity within each oceanic population.

The Committee noted that the project was generally methodologically sound and the objectives of the study were likely to be achieved. Although some concerns were expressed about limited number of samples and a possible need for more emphasis on the nuclear aspect of the survey, the Committee **recommends** funding the final stage of the project (see Item 23).

10.5.2.7 REVIEW OF 'DRAFT CONSERVATION MANAGEMENT PLANS FOR SOUTHERN RIGHT WHALES'
The Commission has agreed that southern right whales of South America should be candidates for IWC Conservation Management Plans (IWC, 2012b). As discussed in Annex F, two draft plans were available, one for southwest Atlantic southern right whales (IWC/64/CC7rev1) and one for southeastern Pacific southern right whales (IWC/64/CC9).

The Committee examined these draft CMPs for their scientific content and related actions and found them to be in accord with the results and recommendations from the IWC Workshops on the status of southern right whales (SC/64/Rep5) and the southern right whale die-off (IWC, 2011k).

10.6 Other stocks of right whales and small stocks of bowhead whales
An update was provided on North Atlantic right whales for the period November 2010-October 2011, reflecting the work of North Atlantic Right Whale Consortium, 2011. A collaborative photographic catalogue suggested that there were 490 North Atlantic right whales in 2010. Five right whale deaths were documented during the report period. Additionally, there were 11 new entanglement cases documented. The Committee **thanks** the authors for this update and looks forward to receiving further information next year.

SC/64/ProgRepJapan reported that in February 2011, a right whale was found dead in a set net in Oita prefecture. A skin sample was sent to the Institute of Cetacean Research (ICR), where DNA was extracted and it was confirmed as a right whale. However, the ICR branch in the Tohoku region was hit by the tsunami on 11 March 2011 and the sample was lost.

SC/64/O6 reported sighting information for North Pacific right whales from sighting surveys conducted in May 2011 in the western North Pacific. A total of 13 schools (20 individuals) was sighted, from which 19 individuals were photographed and 14 biopsied successfully.

The Committee **welcomes** new information on North Pacific right whales, noting that such sightings were rare. It looks forward to receiving a fuller report of the sighting survey at the next meeting.

No update was available for the small stock of bowhead whales in the Sea of Okhotsk.

Moore *et al.* (2012) provided results of a year-long acoustic study of the Spitzbergen stock of bowhead whales from September 2008 to September 2009 in western Fram Strait (79°N, 5°W). The rate of bowhead whale call detection was high from September 2008 through May 2009, including calls detected on every day of the month from November through February when sea ice was 90-100% surface cover.

The Committee continues to **reiterate** its grave concern over these small stocks and **encourages** continued or expanded research on these small populations.

10.6.2 Work
The Committee's views on the work plan for these stocks are given under Item 21.

10.7 Arabian Sea humpback whales
10.7.1 Review intersessional progress
The Scientific Committee has in the past (most recently in IWC, 2012m), recommended further research to help address the serious conservation status of the Arabian Sea humpback whale which is recognised as an isolated resident sub-population of humpback whales with an estimated population size of 82 (95% CI 60-111; Cerchio *et al.*, 2008; Minton *et al.*, 2011).

SC/64/SH30 provided details of surveys, shore-based observations, and passive acoustic monitoring conducted in Oman during October 2011-March 2012. A total of 36 humpback whales was encountered, 33 of which were photographed and 16 were newly identified individuals. No feeding was observed in the southern survey site and there were nearly three times fewer whales encountered this year. Differences in relative density and feeding may be due to annual fluctuations in food availability as a result of variable oceanographic conditions. Three mother-calf pairs were recorded in Oman during 2011-12, one of which entered the newly operational multi-purpose Port of Duqm. These are the first documented records of humpback whale calves in Oman since 2000. Two mortalities were recorded in January and April 2012. An adult female floating at sea was photographed by local fishermen and a juvenile that stranded live on a remote stretch of shoreline and was subsequently buried by the local municipal authority before scientific investigation could be conducted.

Observations of severe entanglement scarring, as well as coastal road development, operation of a large new port at Duqm, and the planned inauguration of several fast ferry routes through known humpback whale habitat are cause for concern. Efforts are underway to highlight the population's conservation needs with local, national and regional governments as well as the general public, and progress is being made toward the formation of a network of researchers and managers responsible for the design and implementation of a Conservation Management Plan, as recommended last year (IWC, 2012f, p.25).

The Committee **expresses concern** over the relatively large number of strandings from this small population (9 over a 12-year period). Given its endangered status under the IUCN red list and the potential for growth of unregulated whale watching in the region, the Committee **recommends** that whalewatching vessel operator training Workshops should be conducted with a view to promoting best practice for whalewatching and to support the need for development of whalewatching guidelines (see Item 23).

The Committee further noted plans to produce an updated mark-recapture estimate of population size. It **reiterates** its earlier recommendation (see IWC, 2011i), regular abundance surveys to be repeated on a regular basis, with assistance in planning and analysis from relevant experts.

10.7.2 The development of a CMP

The Committee has previously noted that this population is a likely candidate for an IWC Conservation Management Plan (CMP). An intersessional Working Group was formed at last year's IWC meeting to facilitate this process in accordance with the guidelines adopted last year by the Commission (IWC, 2012b). A key component of any plan is that it is supported by a broad range of stakeholders including range state governments. The Committee welcomes the progress that has been made in assembling the documentation required to submit a proposal to the IWC for a candidate CMP. It **strongly recommends** that discussions between scientists and relevant range state governments continue to further progress the CMP process.

10.7.3 Work plan

The Committee's views on the work plan are given under Item 21.

10.8 Cruises

10.8.1 The IWC-POWER programme

10.8.1.1 PLANNING THE IWC-POWER[14] PROGRAMME

The Scientific Committee has been discussing the objectives and priorities of the IWC-POWER programme since 2009 (e.g. IWC, 2012v) and this culminated in the discussions given in IWC (2012l).

[14]North **P**acific **O**cean **W**hale and **E**cosystem **R**esearch programme.

The Committee and the Commission agreed the long-term objectives for the programme in IWC (2012l).

> 'The programme will provide information to allow determination of the status of populations (and thus stock structure is inherently important) of large whales that are found in North Pacific waters and provide the necessary scientific background for appropriate conservation and management actions. The programme will primarily contribute information on abundance and trends in abundance of populations of large whales and try to identify the causes of any trends should these occur. The programme will learn from both the successes and weaknesses of past national and international programmes and cruises, including the IDCR/SOWER programme.'

IWC (2012v) provided an extensive review of current knowledge in the region, and a list of medium-term priorities by species for the programme was developed.

SC/64/Rep1 presents the report of a meeting of the Technical Advisory Group (TAG) established last year. The report builds upon the extensive work already undertaken to provide an overall strategy and detailed 5-year plan for the IWC-POWER programme, including statistical power calculations. The TAG workshop initially focused on methodological issues to investigate distribution, abundance and trends. It made a number of practical recommendations for visual methods (SC/64/Rep1, item 3.1) regarding survey mode, track design, and angle and distance experiments. Initial power analyses suggest the need for increased future effort (at present only one vessel is available) to be able to detect trends. The results of the short-term programme (see below) will allow improved power analyses and a better determination of required effort for the medium-long-term. Other techniques examined included mark recapture and acoustic methods and recommendations for further investigative and collaborative work were made. It also examined past data to investigate the amount of effort required to obtain photo-IDs and biopsy samples; this information is valuable for both short- and medium-term planning.

After reviewing the available information, an integrated short-term strategy (for the years up to 2015) was developed in light of the medium-long-term objectives (SC/64/Rep1, item 7.1). The objective is to complete an initial survey of the remaining poorly covered areas (SC/64/Rep1, fig. 1) to facilitate choice of appropriate survey blocks and strata for a long-term monitoring plan along with the essential undertaking of a more specific power analysis of the effort required to detect trends in abundance should they occur.

The TAG also made recommendations on the need for improved data collection systems, archiving of all kinds of data collected during the programme and a mechanism to ensure prompt collaborative analyses of the data collected (SC/64/Rep1, item 6). A detailed proposal for how to address these issues will be made at the 2013 Annual Meeting.

The Committee welcomes this report and **endorses** its recommendations. Noting the valuable contributions already made by Japan, Korea, the USA and Australia, it **strongly encourages** range states and others to consider more active participation in the IWC-POWER programme.

10.8.1.2 REPORT ON THE 2011 IWC-POWER CRUISE

The 2nd annual IWC-POWER survey was successfully conducted from 11 July to 8 September 2011 in the eastern North Pacific (north of 40°N, south of the Alaskan Peninsula, between 170°W and 150°W) using the Japanese Research Vessel, the *Yushin-Maru No.3*. The cruise had five main objectives:

(1) to provide information for the proposed future in-depth assessment of sei whales in terms of both abundance and stock structure;

(2) to provide information relevant to *Implementation Reviews* of whales (e.g. common minke whales) in terms of both abundance and stock structure;
(3) to provide baseline information on distribution and abundance for a poorly known area for several large whale species/populations, including those that were known to have been depleted in the past, but whose status is unclear;
(4) to provide biopsy samples and photo-ID photos to contribute to discussions of stock structure for several large whale species/populations, including those that were known to have been depleted in the past but whose status is unclear; and
(5) to provide essential information for the intersessional Workshop to plan for a medium-long term international programme in the North Pacific.

Plans for the cruise were endorsed by the Committee (IWC, 2011f) and the Committee agrees that it was duly conducted following the guidelines of the Committee.

On behalf of the Committee, Kato thanked the Cruise Leader, researchers, captain and crew for completing the second cruise of the POWER programme. The Government of the USA had granted permission for the vessel to survey in its waters, greatly contributing to the success of the cruise. The Government of Japan generously provided the vessel and crew for the survey.

Recognising the tremendous effort and expense in conducting the IWC-POWER survey, the Committee was yet again disappointed that potentially valuable data on stock structure was not able to have been collected as it had not been possible to resolve CITES permit issues regarding collection of biopsy samples collected outside of Japanese waters. The Committee **strongly recommends** that these issues are resolved. In planning for the 2013 survey, Hiruma reported that some initial progress on this front had been made, and would continue. He hoped to be able to report a positive outcome to ongoing talks between the governments of Japan and the USA in the near future. Brownell explained that the Japanese research vessel with biopsy samples collected on the high seas can enter and exit the US EEZ without a CITES permit, but biopsy samples cannot yet be collected in the USA.

10.8.1.3 THE 2012 IWC-POWER CRUISE

SC/64/Rep7 presented the report of the detailed planning meeting for the 2012 IWC-POWER cruise that had been endorsed last year (IWC, 2012l). The cruise will take place north of 40°N to the north American coast between 140°W and 135°W. The vessel kindly supplied by Japan will depart on 13 July 2012. The Committee **endorses** the report and looks forward to receiving the report of this cruise next year.

10.8.1.4 PLANS FOR THE 2013 IWC-POWER CRUISE

SC/64/O7 presented the research plan for the fourth survey in the IWC-POWER programme. The research area will be from the area from 160°-135°W, between 30°-40°N latitude. The plan was drawn up following guidelines agreed at the 2010 and 2011 Tokyo Planning Meetings (IWC, 2012v and SC/64/Rep1) and in light of the objectives developed in SC/64/Rep1. The cruise will collect line transect data, to estimate abundance, and biopsy/photo-ID data. Biopsy sampling will be undertaken on priority species (sei, fin, right, blue and humpback whales) and on other species on an opportunistic basis. Some dedicated research time will also be allocated to photo-ID and/or video-taping of fin, right, blue and humpback whales. Final planning will take place at a planning Workshop to be held in Tokyo in October 2012.

The Committee thanks the Government of Japan for its generous offer of providing a vessel for this survey.

10.8.2 Other North Pacific cruises (and see Item 6)

10.8.2.1 REPORT OF JAPANESE CETACEAN SIGHTING SURVEYS IN THE NORTH PACIFIC IN 2011

Three systematic dedicated cetacean sighting surveys were conducted in 2011 by Japan (ICR) as a part of JARPN II to examine the distribution and abundance of large whales in the Western North Pacific. The total searching distance was 4,060.3 n.miles. The sei whale was the main species sighted. The plans for these surveys were endorsed in the last year (IWC, 2012f) and the surveys were conducted as planned (SC/64/O6).

10.8.2.2 PLANS FOR JAPANESE CETACEAN SIGHTING SURVEYS IN THE NORTH PACIFIC IN 2012

SC/64/IA6 reports on plans for three systematic dedicated sighting surveys by Japan (ICR) as a part of JARPN II in the North Pacific in 2012, the first of which is currently underway. The main objective is to examine the distribution and estimate the abundance of common minke and Bryde's whales for the management and conservation purposes. Distance and angle estimation experiments will be conducted on all cruises. Biopsy skin samples of blue, fin, humpback and right whales will be collected on an opportunistic basis. Photo-ID experiments on blue, right and humpback whales will be also conducted opportunistically. Reports of the three sighting surveys will be submitted to the 2013 Annual Meeting.

10.8.3 Cruises in the Antarctic Ocean

10.8.3.1 PROGRESS ON IDCR-SOWER CRUISES PUBLICATIONS

An intersessional email correspondence group (IWC, 2012u, Annex R) worked by correspondence and also met at this meeting. Its terms of reference were to consider:

(a) updating the IWC website; and
(b) creating a special volume of the *Journal of Cetacean Research and Management.*

Plans are already underway with respect to (a) including inclusion of photographs, video, acoustic recordings and links to key publications and reports. Pertaining to (b), the Group prepared a proposed outline for the volume, with suggested authors/lead persons for each topic identified (see Annex G).

The Committee endorses the approach proposed. It **agrees** to the appointment of Bannister to lead the creation of the commemorative volume. An Editorial Board was nominated and tasked with responsibility for the volume's preparation.

The Committee **agrees** that the work contributing to the volume would be greatly facilitated by the preparation of some standard sighting datasets (for species other than Antarctic minke whales). The Secretariat kindly agreed to prepare such datasets from DESS in collaboration with knowledgeable scientists.

10.8.3.2 REPORT OF THE 2011/12 CETACEAN SIGHTING SURVEY IN THE ANTARCTIC

Plans for a dedicated sighting survey in the Antarctic in the 2011/12 austral summer season were presented last year and subsequently endorsed by the Committee (IWC, 2012f). The research vessels *Yushin-Maru No 2* and *Yushin-Maru No 3* were to survey in Area IIIE, Area IV and western part of Area V. The survey methods were to be the same as in IWC-SOWER surveys, and trackline design was improved to provide approximately uniform coverage probability. Furthermore, the planned sighting procedure was in accordance with the guidelines agreed by the Scientific Committee (IWC, 2012x). Unfortunately no research activity could be conducted due to external violent interference by an anti-whaling group (SC/64/IA8).

The Committee **expresses regret** that these actions had prevented the sighting survey from being conducted as reportedly planned. Following the cessation of the IDCR/SOWER programme in 2009, these surveys now provide the only dedicated cetacean sighting data in this region of the Southern Ocean that might be used for abundance estimation, and as such are extremely valuable to the work of the Scientific Committee.

10.8.3.3 PLANS FOR CETACEAN SIGHTING SURVEYS IN THE ANTARCTIC IN THE 2012/13 SEASON

A systematic two-vessel sighting survey for abundance estimation is planned in the Antarctic in the 2012/13 season (SC/64/IA7) as part of JARPA II. The research area is south of 60°S in the Antarctic, in the eastern part of Area III, throughout Area IV and in the western part of Area V, between 35°E and 175°E from December 2012 to March 2013. Details of the cruise, which also incorporates biopsy sampling and photo-ID work are incorporated in Annex G, item 6.5. The cruise report will be prepared by researchers and submitted to next year's Annual Meeting.

The Committee reviewed and endorses the plans for the proposed sightings survey. Noting the insight gained in SC/64/Rep4 on internally-estimated cue rates, it suggests that efforts be taken to ensure accurate times of sightings in IO mode, so that delayed and simultaneous duplicates could be more readily distinguished. The Committee **agrees** that this will be useful for estimating abundance from these data, and also invited any further suggestions for improved survey protocols from the developers of the methods described in SC/64/IA2 and SC/64/IA13, based on lessons learned in completing their analyses.

10.9 Progress towards an in-depth assessment of North Pacific sei whales

SC/64/IA11 presented an abundance estimate of North Pacific sei whales using data from the 2011 IWC-POWER cruise. Standard line transect methodology was applied to estimate abundance, assuming $g(0)=1$. In order to examine the robustness of the abundance estimate to alternative stratification options and detection functions, a sensitivity analysis was conducted. The abundance estimate for the surveyed area in the eastern North Pacific (north of 40°N, south of the Alaskan Peninsula, between 170°W and 150°W), was 6,587 (CV=0.420). When data from recent cruises become available, a revised abundance estimate for North Pacific sei whales will be presented using the IWC-POWER sighting data from the period 2010-12.

The Committee also received the report of the intersessional Working Group that had been appointed last year to prepare for the assessment. The group saw no impediment to conducting the In-Depth Assessment (IDA) as planned in 2013. It is anticipated that analyses of sei whale sightings from the POWER surveys through 2012 will be available for the assessment. The IDA will not address the question of suitability of data for use in the RMP.

Work on the historical catch series has proceeded. Allison has received new data on Canadian historic catches that is being entered into the IWC database. The findings of a new analysis of Soviet North Pacific catch records are also being incorporated. Sei whale catches in the IWC database are higher than the true catches because protected species like fin and humpback whales were reported as sei whales.

The Committee was informed that Mizroch and Ohsumi have recently analysed a sample of Japanese coastal whaling log books, and found that the catches of sei and Bryde's whales are differentiated in the log books, while this is not the case in the IWC individual catch database, although the total numbers agree. The Committee **recommends** that this work be extended, in collaboration with Allison, to cover the years for which the IWC and Japanese figures differ. The Committee also **recommends** that the Secretariat be requested to consolidate other historical catch series for this species, and together with the Working Group, begin collating all available information in order to complete this assessment.

The Committee **recommends** that the sei whale IDA proceed as planned at the 2013 Annual Meeting. An intersessional Steering Group was appointed to oversee preparations (Annex Q14).

11. STOCK DEFINITION

This Agenda Item was established in 2000, when a Working Group was established (IWC, 2001c). This year, updated Terms of Reference were adopted by the Working Group to reflect the evolving needs of the Committee (Annex I, Appendix 2). Continuing its original purpose, the Working Group will develop a reference glossary of stock related terms, to aid consistent definition of 'stocks' in a management context for the Committee (see Item 11.4). The Working Group will also continue to develop guidelines for preparation and analysis of genetic data within an IWC context (see Item 11.1), and software that evaluates the management utility of various population genetic analyses (see Item 11.3). A major change stems from the Committee's request for the Working Group to discuss high-priority Committee papers related to population structure. The Working Group will now provide the Committee with feedback and recommendations concerning stock structure related methods and analyses used in those papers (see Item 11.2). The Report of the Working Group is given as Annex I.

11.1 Guidelines for DNA data quality and genetic analyses

Two sets of reference guidelines have been developed and endorsed by the Committee (IWC, 2009e) and form 'living documents' that can be updated as necessary. The first set addresses DNA validation and systematic quality control in genetic studies (SC/64/SD2). The second set provides guidelines for some of the more common types of statistical analyses of genetic data used in IWC contexts, and contains examples of management problems that are regularly faced by the Committee. Substantial progress on these latter guidelines was made during a small Workshop in April, and this document will now be completed intersessionally (see Item 11.5). Both guidelines will also be published in the peer-reviewed literature.

11.2 Statistical and genetic issues related to stock definition

A number of stock related papers were discussed by the sub-group at the request of the following sub-committees and Working Groups: Revised Management Procedure (Annex D), Aboriginal Whaling Management Procedure (Annex E), *pre-Implementation Review* of western North Pacific common minke whales (Annex D1), and Other Southern Hemisphere Whale Stocks (Annex H). Technical comments on these papers are given in Annex I.

Some general comments were made which are relevant to many papers submitted to the Scientific Committee. Firstly the Committee noted that uncertainty around point estimates is not always considered and urged that, where available, confidence intervals should always be reported in order that precision of estimates can be evaluated. Secondly, failure to reject a hypothesis, e.g. panmixia, is not equivalent to support for that hypothesis; strong statements of support should not be given to any null hypothesis that has not been rejected. Thirdly, there is often inconsistent treatment and interpretation of the genetic differentiation metric 'F_{ST}' amongst papers. Simplistic interpretations of this statistic should be avoided, such as conversion into migration rates, as these can misinform management scenarios.

The Committee **agrees** to compile results from past RMP trials of various species intersessionally, in order to try to identify where there were 'tipping points' in inter-population migration rates which made significant differences to trial outcomes, i.e. at what level does migration make a difference for each species? Such information may help to better define the parameter space over which inter-population migration rates are informative to management. This work will be presented at the 2013 Annual Meeting (see Item 11.5) and can be carried out in conjunction with projects being undertaken by the sub-committee on the RMP and the SWG on the AWMP (see Annexes D and E respectively).

11.3 Progress on the Testing of Spatial Structure Models (TOSSM)

The aim of TOSSM (IWC, 2007a) is to facilitate comparative performance testing of population structure methods intended for use in conservation planning. From an IWC perspective, the TOSSM software package allows evaluation of methods for detection of genetic structure, in terms of how well the methods can be used to set spatial boundaries for management. It is available for all to use and simulated datasets exist for three of the five stock-structure Archetypes previously proposed by the Committee (IWC, 2010d, p.51).

TOSSM is also a flexible simulation tool for investigating how certain observed genetic phenomena might arise among animals such as whales whose life histories are not well described by classical genetic theory. A practical example of this is provided by the Pacific Coast Feeding Group (PCFG) of eastern gray whales (see Annex E), which appears to be genetically different from the northern Aleutian feeding ground, yet also receives immigrants from it (which would be expected to influence observed genetic differentiation). Simulation testing of various immigration scenarios in the TOSSM framework was carried out in SC/64/AWMP4 (Annex E). The Committee welcomes this paper and noted its value in exploring the range of scenarios compatible with the observed differentiation, as it investigates a range of factors, including the degree and timing of isolation and effective population size of the PCFG. The results have informed the current *Implementation Review* of gray whales (Annex E, item 2.2.2). Some longer term work items were suggested for this study: (1) to incorporate a minimum female calving interval into the most realistic (9-stage) life history model; (2) to report results using summary statistics that are as independent as possible (and therefore provide multiple checks on the similarity between the simulations and the observed data); and (3) to identify research needs for future field surveys in order to improve current parameterisation of the models.

11.4 Terminology and unit-to-conserve

Defining and standardising the terminology used to discuss 'stock issues' remains a long standing objective of the Working Group, in order to help the Committee report on these issues according to a common reference of terms. A suite of definitions for Committee terms such as 'population', 'subpopulation', 'stock', 'sub-stock' and 'management unit' was provided in SC/64/SD3 as a first effort to build a 'living' glossary of stock related terms, with reference to past discussions within the Working Group and to terminology applied in other management contexts. This glossary will be developed intersessionally by members of the Committee, who will also try to come up with a series of agreed criteria for classifying population units by these terms, with reference to their usage in other management and conservation contexts (see Item 11.5).

11.5 Work plan

The Committee's view of the work plan is given under Item 21.

12. ENVIRONMENTAL CONCERNS (E)

The Commission and the Scientific Committee have increasingly taken an interest in the possible environmental threats to cetaceans. In 1993, the Commission adopted resolutions on research on the environment and whale stocks and on the preservation of the marine environment (IWC, 1994a; 1994b). A number of resolutions on this topic have been passed subsequently (e.g. IWC, 1996; 1997a; 1998; 1999a; 1999b; 2001b). As a result, the Scientific Committee formalised its work on environmental threats in 1997 by establishing a Standing Working Group that has met every year since then. Its report this year is given as Annex K.

12.1 State of the Cetacean Environment Report (SOCER)

SOCER provides an annual update, requested by the Commission, on: (a) environmental matters that potentially affect cetaceans; and (b) developments in cetacean populations/species that reflect environmental issues. It is tailored for a non-scientific audience. The 2012 SOCER (SC/64/E2) was restricted to the Indian Ocean as the regional focus, due in part to reduced funding. A primary source of information was the International Indian Ocean Cetacean Symposium, held in 2009 in the Maldives[15]. Overall, the awareness of environment-related threats to cetaceans is high in the region, but implementation and control measures are poor. However, this provides an opportunity to introduce best practices, state-of-the-art procedures for critical issues such as fisheries interactions, ship strikes, whalewatching, and new, well-thought-out Marine Protected Areas.

During discussion, it was noted that marine research in the Indian Ocean region is focused in a few locations, despite having expanded over the past five years. Cetacean, or indeed environmental, research is scant or absent in many areas and there are few peer-reviewed reports from the region. The Committee was pleased to learn that the next issue of *J. Cetacean Res. Manage.* (published this year) contains 15 peer-reviewed papers from the Indian Ocean.

Highlighting specific issues in the region, there are clearly 'hotspots' in terms of pollution, fisheries bycatch and environmental degradation (e.g. Arabian Gulf). Reports of mass mortality events (152 small cetaceans in Iran in

[15]*http://www.mrc.gov.mv.*

September 2007, spinner dolphins and striped dolphins in two events, and 200-250 pantropical spotted dolphins in Pakistan in March 2009) on the northern coast of the Indian Ocean are particularly concerning because these three species do not usually mass strand in these numbers and the latter event occurred the day after the commencement of a multi-national naval exercise (AMAN 09) in Pakistani waters.

Next year the focus of the SOCER will be the Atlantic Ocean region and the SOCER editors request Committee members provide input, preferably in the form of pdf files, of papers published between 2011 and 2013.

12.2 Pollution

POLLUTION 2000+ is a long standing programme of the Committee. Three goals were identified at the IWC Intersessional POLLUTION 2000+ Phase II Workshop (IWC, 2011e):

(1) develop integrated modelling approaches and risk assessment framework for evaluating the cause and effect relationship between pollutant exposures and cetacean populations;
(2) identify data needs and available datasets or case studies that would be appropriate for the models that are exposure driven, source driven or effects driven; and
(3) develop a prioritisation framework to evaluate the broad number of environmental pollutants.

12.2.1 Update on POLLUTION 2000+ Phase II progress

At the intersessional POLLUTION 2000+ Phase II Workshop held in 2010 (IWC, 2011e), four objectives for the cetacean pollutant exposure and risk assessment modelling component were agreed: (1) improve the existing concentration-response function for PCB-related reproductive effects in cetaceans (completed in 2011); (2) derive additional concentration-response functions to address other endpoints (e.g. survival, fecundity) in relation to PCB exposure; (3) integrate improved concentration response components into a population risk model (individually-based model) for two case study species: bottlenose dolphin and humpback whale (completed in 2011); and (4) implement a concentration-response component for at least one additional contaminant of concern. The authors of SC/64/E5, funded by the IWC, investigated how contaminant-induced effects on immune function could be incorporated into the existing individual-based population framework constructed to assess the impact of polychlorinated biphenyls (PCBs) on cetacean populations (Objective 2).

By determining how the blubber PCB annual accumulation rates relate to concentrations in breeding females, comparisons with empirical data can be made and predictions about effects on various populations formulated. For example, based on the current blubber PCB concentrations determined in breeding females from two bottlenose dolphin populations in Sarasota Bay and St Joseph Bay, Florida, the model predicts that these populations would remain stable or increase slightly over the 50-100 year timescales projected. Conversely, the bottlenose dolphin population in Brunswick, Georgia, where PCB levels in breeding females are 10 times higher, is predicted to decline over the same period without external population inputs through immigration.

In the future, impacts on other populations and species, such as humpback whales from the Gulf of Maine will be investigated (e.g., Hall *et al.*, 2011), as additional contaminant data for females become available. In addition, future developments of this model will include a sensitivity analysis; incorporation of a bioaccumulation model to estimate blubber concentrations for populations or species in which only levels in prey are known; and making the model available online with a user-friendly interface.

During discussion (see Annex K), it was noted that body condition of cetaceans may have a significant effect on susceptibility to impacts from contaminant exposure. For example, body condition could affect immune function independently so when food is limited and animals are in poor condition this will further affect their ability to fight off pathogens. Furthermore, if PCBs are released from the blubber during periods of increased energy demand then more may be bioavailable. Although the current model does not account for body condition, the final phase of the project will incorporate a toxicokinetic model that will include body condition parameters, similar to an approach taken by Hickie *et al.* (1999).

The Committee **recognises** that cetaceans are exposed to a mixture of environmental contaminants. It **suggests** that, if possible, mixtures of contaminants should be added to the model. Due to the extremely high levels of PCBs measured in the bottlenose dolphins in Brunswick, Georgia, USA, the Committee **strongly recommends** the continued monitoring of this population. The Committee **commends** the authors for the most recent results from the IWC's POLLUTION 2000+ programme and **strongly supports** their continued work to develop the necessary tools for analyses of pollutant exposure risk to cetaceans.

12.2.2 Oil spill impacts

12.2.2.1 UPDATE ON RESPONSE TO DEEPWATER HORIZON OIL SPILL IN THE GULF OF MEXICO

An update on the 2010 Deepwater Horizon (DWH) oil spill in the Gulf of Mexico was provided, where the injury assessment for cetaceans continues. The Natural Resource Damage Assessment (NRDA), a formal process in the USA to assess damages to natural resources, has included photo-ID, remote biopsy, live capture health assessments and evaluation of stranding data for common bottlenose dolphins in nearshore waters. Analyses of tissue, blood, and urine samples from cetaceans in the Gulf of Mexico for PAHs and PAH metabolites have also continued, as outlined in the NRDA plans.[16]

In addition to the NRDA, an Unusual Mortality Event (UME) is ongoing in the northern Gulf of Mexico principally involving bottlenose dolphins[17]. The UME involved 745 cetacean strandings in the Northern Gulf of Mexico from 1 February 2010-10 June 2012, which started before the DWH oil spill. The historical average (2002-09) for this area is 74 dolphins per year. The vast majority (95%) of stranded dolphins have been found dead; however, 35 stranded alive and seven were taken to facilities for rehabilitation. The UME is still ongoing, however stranding rates in the Northern Gulf in April and May 2012 were near-average.

Although it is typical to see strandings of dolphins less than 115cm (perinates) in the spring, there was a marked increase in strandings of this age class in spring 2011. Of these perinatal dolphin strandings, most were found to have died *in utero*. Twelve of 51 cases targeted for testing were positive for *Brucella,* and 8 cases were confirmed to have died of brucellosis. Compared to 2011, the number of stranded perinatal dolphins was lower during the spring of 2012. Three additional cetacean studies related to the DWH

[16]*http://www.gulfspillrestoration.noaa.gov.*
[17]*http://www.nmfs.noaa.gov/pr/health/mmume/cetacean_gulfofmexico 2010.htm.*

spill are underway in the Gulf of Mexico, including two passive acoustic surveys and one tagging study of sperm whales.

The Committee **commends** this research related to the DWH oil spill and **strongly recommends** continued investigations into the impacts of the DWH oil spill on cetaceans, including exposure to oil spill related contaminants, biomarker investigations and health assessments. Furthermore, it **encourages** the early and full reporting of the findings of DWH studies into the public domain.

12.2.2.2 CAPACITY BUILDING REGARDING OIL SPILL IMPACTS ON CETACEANS

In 2011, the Committee agreed that there was significant need and interest in cross-training between the oil spill and marine mammal communities and established an intersessional e-mail group to evaluate the possibilities for such training (Annex Q19; IWC, 2012o). As part of an effort to better understand and be prepared for oil spills and their impacts on marine mammals particularly cetaceans, workshops and planning exercises are underway or have taken place including: (1) an oil spill response workshop held at the International Conference on Marine Mammal Protected Areas (ICMMPA)[18]; and (2) dissemination of information and data on marine mammals at international meetings on oil spill response or with oil spill responders.

The ICMMPA workshop included presentations from the Regional Marine Pollution Emergency Information and Training Centre (REMPEITC) in the Wider Caribbean Region and the Oiled Wildlife Care Network, industry, oil spill responders, and marine mammal scientists and managers. A number of recommendations developed at the workshop were reviewed and found similar in nature to those discussed last year (IWC, 2012o), in particular the desirability of companies, agencies, stakeholders and international organisations to work in cooperation with marine mammal specialists on oil spill response plans.

In discussion, the Committee noted that some response plans that are currently under development, especially those related to the Arctic, focus on identifying sensitive areas for marine mammals. However, in most areas, important baseline data are lacking and the Committee **recommends** that these data gaps be filled. It also **recommends** that oil spill response efforts throughout the world should include pelagic as well as coastal areas; further information on current capacities and mechanisms of oil spill recovery will be valuable. Last year, the Committee noted that a review of the capacity for oil spill response in the Arctic was an urgent priority in the aftermath of the DWH oil spill (IWC, 2012o). The Committee **agrees** that the recommendations from the 2011 MMPA workshop in Martinique will provide guidance on oil spill prevention and response in the Arctic at the upcoming intersessional Arctic Anthropogenic Impacts Workshop (see Item 12.5.3).

12.2.3 Other pollution related issues

Fossi provided information on Mediterranean odontocetes exposed to environmental stressors, in particular to persistent organic pollutants, emerging contaminants, polycyclic aromatic hydrocarbons (PAHs) and trace elements. In Panti *et al.* (2011), the response of 'gene expression biomarkers' was evaluated in Mediterranean striped dolphin in three sampling areas: the Pelagos Sanctuary (Ligurian Sea), the Ionian Sea, and the Strait of Gibraltar. The mRNA levels of five putative biomarker genes were measured for the first time by quantitative real-time PCR in cetacean skin biopsies. Striped dolphins from the Pelagos Sanctuary are more exposed to ecotoxicological hazards than those inhabiting the Ionian Sea and the Strait of Gibraltar. This evidence focuses attention on the potential risk to cetaceans inhabiting the largest pelagic MPA in Europe and the Committee **stresses** the importance of effective and long-term management of MPAs in order to preserve species in their habitats.

The sources of these contaminants in the study areas are unknown. The Committee **recommends** that the sources be identified, particularly for animals within the Pelagos Sanctuary, to enable the development and implementation of mitigation measures.

In 2005, the Conservation Committee agreed that a research programme to address the issue of inedible 'stinky' gray whales caught by the Chukotkan aboriginal subsistence hunters should be established (IWC, 2006a). This year, the Committee examined IWC/64/CC10, which presented information on the various chemical compounds measured in tissues of malodorous ('stinky') and clean gray whales collected from 2005 through 2011. These included PAHs, persistent organochlorines, benzene derivatives and chlorinated PAHs. The authors commented that the odorous carbonyl compounds measured in tissues of 'stinky' whales may be a result of slow metabolism of petroleum hydrocarbons that occur in the Pacific Ocean. They also noted concentrations of persistent organochlorines in the gray whale tissues were low or not detected (DDT).

It was noted (see Annex F) that the finding of non-detectable DDTs is in contrast to the finding of measurable DDT levels in gray whale calves and mothers sampled in the lagoons in the Baja California region reported in SC/64/E4. Differences in DDT levels among these gray whales are most likely due to differences in contaminant levels on their feeding grounds although levels are generally low. The Committee **emphasises** that a clearer indication of which samples were 'stinky' and which samples were controls would make the information provided easier to interpret. Due to the lack of clarity in this regard (IWC/64/CC10), no new conclusions could be drawn regarding 'stinky'gray whales. The Committee **reiterates** its previous **recommendations** (e.g. IWC, 2006c; 2007f; 2008j; 2009f) that futher efforts be made to determine the cause of the 'stinky' whale condition.

12.3 CERD (Cetacean Emerging and Resurging Disease)

In 2007, the Committee recognised the need for increased research and standardised reporting in a wide range of disciplines dealing with cetacean health (IWC, 2008j), which led to the creation of the Cetacean Resurging and Emerging Disease (CERD) Working Group.

12.3.1 Update from CERD Working Group

An update to the CERD Work Plan agreed last year (IWC, 2012p) was presented. This work plan included:

(1) identification of regional and national experts/points of contact via Steering Committee membership;
(2) creation of a listserve and a website;
(3) creation of a Framework Document; and
(4) identification of and contact with organisations synergistic with the goals of CERD.

The CERD working group (WG) made significant progress on all tasks, except on the Framework Document, where work is now underway to better define the long-term vision and goals for the CERD working group.

[18]*http://www.second.icmmpa.org.*

12.3.2 Progress on CERD website

The CERD website is being developed in two phases. The first phase focuses on large cetacean species and relies on a 'consultation and sharing' approach. The second phase is intended to include all cetacean species and incorporate a potential 'reporting' role. This website will have 'public' and 'registered user' levels. The public level will provide basic information on diseases in cetaceans, as well as access to selected discussion forum content. Registered users will have full access to the site, including in-depth information on cetacean disease, as well as to discussion forums with posting ability. On the main page, a 'map it' feature will allow registered users to record geographic locations of disease incidents, while a 'current events' header will alert website visitors to recent events in cetacean disease and facilitate international communication. Links will be provided for quick access to discussion boards that can be shared with groups focused on other topics such as pollution, ship strikes and marine debris.

It was noted that researchers examining photographs on the website may be able to distinguish between wounds from entanglements, ship strikes or marine debris and this discussion underlined the overlap among these areas. The Committee **agrees** that it will be useful to incorporate standardised tissue collection protocols on the CERD website. The Committee thanked the CERD WG and the Secretariat for their efforts on developing the website and **encourages** continued development of this tool.

12.3.3 Other disease related issues

SC/64/E1 presented the results of a study of six *Morbillivirus*-infected cetaceans stranded along the Italian coastline between 2009 and 2011. The authors concluded that: (1) *Morbillivirus* infection continues to represent a major threat to cetacean health and conservation in the Mediterranean Sea with an increasingly expanding 'host range' of the virus; and (2) the cases of morbilliviral infection characterised by an apparently exclusive involvement of the animal's brain tissues are a matter of concern, both from the conservation and from the comparative pathology standpoints, thereby underscoring the role of cetaceans as models for the study of their human neurological disease counterparts.

Discussion (Annex K) focused on the types of tests and assays performed on these animals and the need for increased surveillance for neurologic diseases in cetaceans. The Committee welcomed this study and **encourages** further studies on these pathogens in cetaceans.

The Committee also noted that there was worldwide press coverage over the recent (February-May) unusual mortality event (UME) of about 900 dead long-beaked common dolphins, *Delphinus capensis*, in Peru, but based on these press reports there remains considerable uncertainty about the cause of this UME. However, no scientific reports were available on this UME for the Committee to review, but the they look forward to receiving reports on the UME next year.

In SC/64/E4 preliminary results were presented on contaminant levels (Organochlorine Compounds - OCs) and biomarkers from biopsies in the San Ignacio Lagoon (Mexico). These preliminary data reveal an accumulation of OCs in gray whale calves resulting from the lactational transfer of these compounds from their mothers. Exposure to OCs (such as DDTs) at early life stages may have toxic impacts on their developing endocrine, immune and neural systems. The paper is discussed fully in Annex K.

The Committee welcomed this paper, noting its relevance to the IWC's POLLUTION 2000+ programme and **encourages** continued studies.

SC/64/E8 provided a review of diseases and micro-organisms, as well as the public health and conservation impacts from cetaceans that stranded in Costa Rica during 2004-11. Humans and cetaceans affected by marine *Brucella* can develop severe disease such as neurobrucellosis and osteomyelitis, and the authors concluded that conservation policies should support research that investigates incidence, prevalence, geographic distribution and host range of *Brucella* infection in cetaceans. The paper is discussed fully in Annex K.

The Committee **welcomes** this paper, noting that data obtained from studies such as this are part of 'The One Health' concept - a worldwide strategy for expanding interdisciplinary collaborations and communications in all aspects of health care for humans, animals and the environment[19]. The Committee recognised *Brucella* as an important zoonotic pathogen and **encourages** additional research on this disease agent.

12.4 Anthropogenic sound

In 2010, the Committee reviewed evidence of masking of cetacean calls from anthropogenic sound, with an emphasis on low-frequency sounds (<1kHz) from commercial shipping and airguns used during seismic surveys (IWC, 2011j). It had recommended that: (1) the masking potential of anthropogenic sources be quantified and acoustic measurements be standardised; and (2) IWC member governments work to develop a quantitative approach for assessing cumulative impacts of anthropogenic sound on cetaceans.

12.4.1 Mitigation of effects of anthropogenic sound on cetaceans

US federal regulations require scientists and representatives of offshore industries to acquire incidental harassment authorisations for activities that may disturb marine mammals, but the potential impacts of sound are often considered on a project-by-project basis in isolation from one another. This precludes meaningful analysis of cumulative impacts from multiple sources. In response to consideration of offshore industrial activities in the Alaskan Arctic, Moore *et al.* (2012) proposed a three-step assessment framework based development of *acoustic habitats*, which constitute the aggregate sound field from multiple sources compiled at spatial and temporal scales consistent with the ecology of Arctic marine mammals. Assessment framework steps include: (1) the development of acoustic habitat maps depicting anticipated sound fields from multiple sources; (2) an overlay of acoustic-habitat maps with marine mammal seasonal distribution and density maps to identify areas or periods of concern and data gaps; and (3) development of precautionary measures to protect marine mammals from potential impact and a prioritisation of data gaps and research needed to address those gaps.

In the US, the Cetaceans and Sound (CetSound) project is now working toward mapping products envisioned in the first two steps of this framework[20]. The CetSound project consists of two working groups convened to develop mapping tools: the Underwater Sound-field Mapping (SoundMap) and the Cetacean Density and Distribution Mapping (CetMap). The overarching objective of the SoundMap group is to create maps depicting the temporal, spatial and spectral characteristics of both chronic (e.g. shipping) and episodic

[19]*http://www.onehealthinitiative.com/index.php* and *http://www.oie.int/en/.*
[20]*http://www.cetsound.noaa.gov/index.html.*

(e.g. seismic survey) underwater noise. The overarching objective of the CetMap group is to create regional cetacean density and distribution maps that are time- and species-specific, using survey data and models that estimate density using predictive environmental factors. To augment the more quantitative density mapping and provide additional context for impact analyses, the CetMap group is also identifying known areas of specific importance for cetaceans, such as reproductive areas, feeding areas, migratory corridors, and areas in which small or resident populations are concentrated. The Committee **commends** the initial development of these powerful mapping tools, **endorses** this work and **strongly recommends** support for further development and improvement of these tools.

The Committee also **welcomes** the information on work being undertaken regarding noise by IUCN's Western Gray Whale Advisory Group and especially its Noise Task Force[21] (see Annex F).

12.4.2 Other anthropogenic sound related issues

Underwater noise from commercial shipping is chronic (IWC, 2011j). The IMO has established a correspondence group (CG) to develop non-mandatory guidelines to address noise from commercial ships; the IWC Secretariat participates in this group (IWC/64/4G). The IMO CG will finish the first draft of their report by the end of 2012 and it will be presented to the IMO in early 2013. The Committee **commends** the continued discussions between the IMO and IWC regarding efforts to reduce noise of newly built vessels. Further, it noted the importance of identifying ship acoustic signatures and **encourages** the collection of these data, as well as the coupling of this information with the appropriate automatic identification system data.

At past meetings, the Committee has received updates on the development of a modelling effort to determine the Population Consequences of Acoustic Disturbance (PCAD) on marine mammals initially proposed by the US National Research Council in 2005. In 2009, the US Office of Naval Research supported a Working Group whose objectives included building a formal mathematical structure for the framework, which led to key adaptations to the original framework, including the incorporation of other sources of disturbance, physiological change and the use of health as the primary metric through which changes in individuals can potentially impact the population. Combined, this led to the framework being renamed the Population Consequences of Disturbance (PCoD). The SWG noted that PCoD is a significant improvement on the PCAD model. Although the current model focuses on single stressors, accumulative effects, behavioural responses and other factors (e.g. acoustic masking) that could potentially affect health could also be added to the model. The SWG **strongly encourages** further work on this model and looks forward to progress updates.

12.5 Climate change

12.5.1 Progress on recommendations from the 2nd climate change Workshop

At the 2nd climate change Workshop (IWC, 2010k), three themes were recommended with regard to the study of cetaceans in the Arctic: (1) single species-regional contrast; (2) trophic comparison; and (3) distribution shift. With regard to the first theme, results of passive acoustic sampling in 2008/09 provided a means to compare seasonal patterns in call detection from bowhead whales in the B-C-B and Spitzbergen stocks, providing a contrast in seasonal occurrence for this species between the Atlantic and Pacific sectors of the High Arctic (Moore *et al.*, 2012). Details of this work are discussed in Annex K.

As also discussed in Annex K, an overview of a new programme was received which was called the Synthesis Of Arctic Research (SOAR). It is a US-based activity, which aims to bring together a multidisciplinary group of Arctic scientists and Alaskan coastal community representatives to explore and integrate information from completed and ongoing marine research in the Pacific Arctic sector[22]. While SOAR is not focused specifically on cetaceans, eight projects under its auspices will focus on aspects of beluga and bowhead whale ecology, which are related to the three study themes of the 2nd climate change Workshop.

The Committee **welcomes** these updates on cetacean-related science in Arctic waters, **endorses** the work undertaken thus far and requests future updates.

12.5.2 Small cetacean restricted habitats Working Group

Building upon the work of an intersessional working group to further recommendations made at the IWC Climate Change Workshop in 2010 (IWC, 2012w), the Committee **agrees** to the following definition:

The spatial extent of the range occupied by these populations may vary by orders of magnitude, but one or more of the following conditions apply: (1) the species/population has narrow habitat requirements; (2) the habitat is bounded by physiographic or oceanographic barriers; and (3) other suitable habitat which the population might be able to access is unavailable because it is occupied by competitors. The first two conditions might apply to fixed populations, such as the vaquita - the third condition in particular requires further consideration and development. These conditions may also apply to populations of large whales (e.g. fin whales in the Mediterranean Sea and the Gulf of California) and it was agreed that large whales would be considered in future discussions on this topic.

The Committee **welcomes** this effort to further advance our understanding of the potential impacts of climate change in cetaceans. However, it also **urges** caution with regard to which populations and species should be focused upon with respect to climate change, so as not to detract from efforts to address more imminent threats and stressors such as bycatch. Creating a list of species or populations to which this definition might apply was suggested as one way to further develop the topic. The Committee also noted the importance of integrating and considering the findings of climate change-related analyses that have been conducted for other marine mammal species (e.g. polar bears and ice seals) when considering the issue for cetaceans.

12.5.3 Planning for an intersessional arctic anthropogenic impacts Workshop

In 2010, the Commission asked the Committee to develop an agenda for a Workshop on Arctic Anthropogenic Impacts on Cetaceans (IWC, 2011a). Last year, a draft agenda was completed and a Steering Group formed (IWC, 2012q) to further develop a plan for the Workshop. A revised agenda that focused on anthropogenic activities related to oil and gas exploration, commercial shipping and tourism was developed intersessionally. The Committee noted that the Workshop agenda should be expanded to include consideration of other anthropogenic activities such as commercial fishing and scientific research. Given rapid

[21] *http://www.iucn.org/wgwap/wgwap/task_forces/.*

[22] *http://www.arctic.noaa.gov/soar/.*

environmental changes and increasing human activities in the Arctic, the Committee **encourages** the continued development of an arctic anthropogenic impacts Workshop focused on climate change, but **strongly recommends** that it:

(1) carefully define the geographical area to be addressed;
(2) focus only on Arctic cetacean species (i.e. bowhead whales, white whales, and narwhals);
(3) consider a broad suite of anthropogenic activities; e.g. oil and gas development, commercial fishing, commercial shipping, tourism, continental shelf mapping and scientific studies;
(4) specifically include possible impacts from underwater sounds, spilled oil, dispersants, invasive species and discharges (including dumping of ballast water) related to exploratory drilling and shipping; and
(5) include a discussion about assessing the cumulative and synergistic impacts of anthropogenic activities.

The topic of anthropogenic impacts to cetaceans in the Arctic is broad and complex and the Committee **recommends** that the process should involve an initial scientific Workshop followed by a more inclusive Commission meeting that addresses management and policy aspects of arctic anthropogenic impacts on cetaceans. It is anticipated that final specification for the scope, agenda and schedule for the Workshop will be undertaken jointly by the Workshop Steering Group and representatives of the IWC and Secretariat.

12.5.4 Other climate change related issues

The IMO is working to develop a mandatory Polar Code to manage the increases in ship traffic in Arctic and Antarctic waters anticipated with the reduction of sea ice associated with climate change (IWC/64/4). The Polar Code work is coordinated by the sub-committee on Ship Design and Equipment, as is the work regarding ship quieting (see Item 9.2). The IWC's endorsement of noise reduction goals (i.e. 3dB in 10 years; 10dB in 30 years) advanced at an international Workshop on shipping noise and marine mammals (Wright and Okeanos Foundation for the Sea, 2008) were re-iterated in a document entitled *Status on Implementation of the Arctic Marine Shipping Assessment 2009 Report Recommendations*, available on the Arctic Council website[23]. The Committee **welcomes** this information, **reiterates its endorsement** of noise reduction goals and looks forward to continued collaborations between the IWC and the IMO on this topic.

12.6 Interactions between MREDs and cetaceans

Given information and a review provided last year, the Committee had endorsed a proposal for a Workshop on interactions between marine renewable developments (MREDs) and cetaceans. That Workshop was held immediately prior to the present Annual Meeting and its report is given as SC/64/Rep6.

Simmonds presented the report and noted that a variety of MREDs are now being deployed worldwide, with the highest concentrations in the Northern Hemisphere, especially in northern Europe. The three main forms of MREDs at this time are: (1) wind farms; (2) tidal-stream driven devices; and (3) wave energy converters. Each of these, as well as their supporting infrastructure, has the potential for interaction with cetaceans during the construction, operation and decommissioning phases (Simmonds *et al.*, 2010).

[23]*http://www.arcticcouncil.gov/pame/amsa/.*

The Workshop received detailed reports on the current state of development and management of marine renewable energy in waters of Germany, the UK, Belgium and the USA, including trans-boundary issues now arising in the busy waters of Europe (SC/64/Rep6, fig. 1). The Workshop focused on the three main types of MREDs and considered potential impact to cetaceans on aspects of 'supporting infrastructure' for MREDs. A number of papers and websites informed discussions throughout the Workshop (SC/64/Rep6, Appendix 2); of particular use was a special synthesis of the work on MREDs conducted by ICES (Murphy *et al.*, 2012).

The Committee noted that MREDs may well play a major role in the mitigation of climate change, which may profoundly affect cetacean populations as discussed at prior climate change Workshops (IWC, 1997b; 2010k). The Committee thanked Simmonds for the successful Workshop. In particular it **endorses** the Workshop's conclusions and recommendations (see especially SC/64/Rep6, item 5). These are briefly summarised below.

1. Strategy to minimise risk

Risks from both lethal and sub-lethal effects can be minimised via a series of actions; the collection, collation and analysis of appropriate baseline cetacean data and appropriate industrial data will allow the identification and quantification of threats and their potential implications for conservation objectives. All stakeholders need to be involved from the outset such that impacts from all factors are considered, ensuring that appropriate mitigation measures and associated monitoring programmes are developed. Suitable scientific evaluation and compliance mechanisms are needed to ensure that mitigation and monitoring are adequate.

2. Broad management

Governments, managers and other stakeholders need to co-operate in strategic planning for MREDs taking into account the trans-boundary nature of cetaceans. Uncertainties over the level of impacts require a staged approach to developments taking into account lessons learned from other developments and other human activities that affect cetaceans, in order to be adequately precautionary. IWC member governments can assist in encouraging the development of international collaboration in this regard, and in particular, they can assist in emphasising the importance of incorporating consideration of cetaceans from an early stage and the value of following the broad strategy and principles outlined in the Workshop report and summarised in Fig. 3.

3. 'Fundamental' research

International collaboration will be required to determine population structure, status, distribution and procedures for assessing impacts. The Committee can assist with design and evaluation of population and impact assessments. While there are established methods for assessing lethal takes, data on the effects of (sub-lethal) stressors on cetaceans are also needed.

4. Evaluation of threats

All lethal and non-lethal impacts of human activities should be considered in an integrated manner, e.g. using modelling approaches that take into account the cumulative impacts from all threats when evaluating whether conservation objectives are likely to be met.

The Committee has considerable expertise in developing management frameworks and testing their performance against specified objectives.

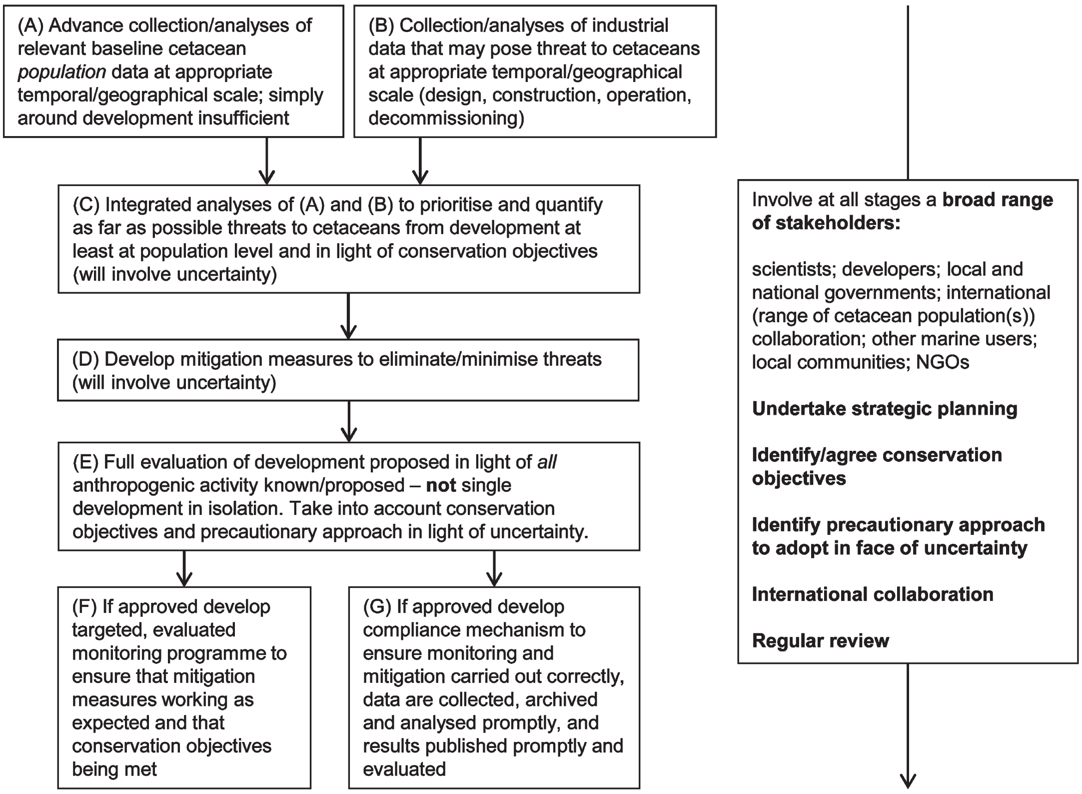

Fig. 3. Simplified schematic summary of a general strategy and principles to minimise environmental threats posed by MREDs. Some stages will occur in parallel and will involve feedback. See report for details.

5. Monitoring
Monitoring should be designed carefully, to assess impacts against pre-determined conservation objectives and to measure the efficacy of any mitigation measures that are implemented.

6. Data sharing and the future role of the IWC Scientific Committee in the consideration of MREDs
Improved information and data-sharing were identified as key and the Workshop encouraged the Committee to continue to act as a forum to review the development of MREDs and their implications for cetaceans, including promoting the sharing of data. Countries were encouraged to help in this by providing appropriate information.

In addition to the Workshop report, the Committee received information from two papers on the topic of interactions between cetaceans and MREDs focused on waters offshore of Scotland (SC/64/E3) and a preliminary assessment of the effectiveness of small Marine Protected Areas (MPAs) to protect dolphins in offshore Wales (SC/64/E6).

It also received an update on Chilean renewable energy projects (SC/64/E12) and noted that consideration should be given on the impacts of coastal wind farms, particularly in regions that support critical habitats for cetaceans. The Committee **strongly recommends** urgent development of environmental impact studies in this area of Chile and urges that a precautionary approach should be used with regard to critical cetacean habitats.

The Committee also **agrees** that there is an urgent need to develop or improve effective noise mitigation measures or quieter foundation installation methods, as noted in past reviews of anthropogenic sound (e.g. IWC, 2010g; IWC, 2012o).

12.7 Other habitat related issues
Primary papers submitted on topics related to other habitat related issues, included potential impacts of marine debris, cumulative impacts and results of a large-scale aerial survey programme in the French tropical EEZ.

12.7.1 Cetaceans and marine debris
In addition to receiving five papers on the topic of marine debris (SC/64/E7, SC/64/E10, SC/64/E13, SC/64/E15 and Fossi *et al.*, 2012), the SWG received the results from an intersessional Working Group (Debris WG) that had considered the issue of both ingestion and entanglement of cetaceans in marine debris. The intersessional group offered the following conclusions and recommendations:

(1) marine debris is a growing concern for marine wildlife in general, but its interactions with cetaceans are poorly understood;
(2) to better evaluate the potential impacts of marine debris on cetaceans and to provide a forum where relevant data can submitted, a Workshop on marine debris and cetaceans should be convened; and
(3) the primary aim of this Workshop would be to determine how to best investigate quantitatively the ways in which marine debris is affecting cetaceans and how best to monitor and mitigate for these effects. The Workshop could also consider how best to develop a centralised database to collate cases of debris interactions, including the development of standardised criteria for data to allow more certain identification of the types of debris and the interactions involved.

Two key issues fundamental to assessing impact of marine debris on cetaceans were identified: (1) how to distinguish cetaceans that have died in active fishing gear versus those entangled in debris (including abandoned, lost, discarded - or 'ghost' - fishing gear) and the need to identify the 'worst culprit' types of fishing gear causing entanglement; and (2) how to investigate the potential accumulation of debris in the deep sea feeding areas of beaked and sperm whales. In addition, more effort is needed to investigate the impacts of microplastics on cetaceans, including baleen whales, which potentially ingest micro-litter by filtration feeding (see Fossi *et al.*, 2012).

The Committee **recommends** that a Workshop on marine debris and cetaceans be held (Annex K, Appendix 3) noting also its relevance to the Working Group on Bycatch with regard to entanglement issues (see Item 7.8). A number of potential data sources for data on marine debris were identified including those of international bodies such as CCAMLR and well as national and local bodies in several countries. SC/64/Rep1 noted the work being undertaken by the USA, Korea and Japan and the Steering Group for the IWC-POWER cruises who are investigating how those cruises can contribute to international efforts to gather information on marine debris (see also Annex G).

12.7.2 Issues related to the March 2011 tsunami in the northwestern Pacific

Concerns have been raised with regard to increased marine debris transport to the eastern Pacific Ocean, as well as radioactive contamination of marine debris a result of the 2011 tsunami in Japan. Modelling efforts estimate that the bulk of the debris related to this event is probably dispersed north of the main Hawaiian islands and east of Midway Atoll[24]. Furthermore, as predicted by these modelling efforts, some buoyant debris reached the east Pacific coast from Oregon to Alaska during winter 2011-12 and continues to occur in the region. It is highly unlikely that debris transported from Japan to the eastern North Pacific poses a radioactive risk. However, transport of non-native, invasive species or pathogenic micro-organisms on tsunami-released debris could occur and pose a threat to eastern Pacific coastal ecosystems. Details of potential impacts of the tsunami-released marine debris on marine mammals and the potential increase in either ingested marine debris or risk of entanglement are summarised in Annex K. Discussion of some Japanese work related to the effects of the tsunami on the marine ecosystem also occurs under Item 17.

12.7.3 Cumulative impacts of anthropogenic activities

SC/64/E11 reported on cumulative impacts of several anthropogenic activities on cetaceans. While there are a number of quantitative processes for assessing the combined impacts of multiple stressors being developed, some are active and used in management. For example, five actions to mitigate cumulative impacts were developed during the permit cycle of the Greenland Bureau of Minerals and Petroleum for the mitigation of cetacean exposures to disturbance from seismic surveys, as given in Annex K.

The Committee **welcomes** information on efforts to develop effective tools to address concerns regarding cumulative impacts of anthropogenic activities on cetaceans. It was noted that the effects of climate change on marine ecosystems may compound the cumulative impacts of anthropogenic stressors, such as chemical pollutants and noise.

12.7.4 REMMOA aerial surveys in the French EEA

The Committee received an update of the REMMOA project (Mannocci *et al.*, Submitted; SC/64/E14), aimed at providing maps of hot spots for pelagic megafauna in the French tropical EEZ and some EEZs of neighbouring countries. The long-term objective of the REMMOA surveys are to establish a baseline of information on cetaceans and other pelagic megafauna diversity and relative abundance and to build up a monitoring strategy to be implemented in the future. Mannocci *et al.* (Submitted) presented analyses of the Caribbean-Guiana survey where the aim of the study was to document top predator communities in terms of encounter rates, composition, abundance and spatial distribution and to compare them between these two contrasting ecosystems. SC/64/E14 presented the analysis of the southwest Indian Ocean survey with a focus on comparing cetacean and other pelagic megafauna communities in areas characterised by contrasted oceanographic conditions. The Committee **welcomes** these updates and **encourages** the results of their work to be presented next year.

12.8 Work plan

The Committee expressed its great appreciation to Moore for her superb guidance and chairing of the SWG over the 5-year period of her service as Chair.

The Committee discussions of the work plan developed in Annex K are given under Item 23.

13. ECOSYSTEM MODELLING

The Ecosystem Modelling Working Group was first convened in 2007 (IWC, 2008i). It is tasked with informing the Committee on relevant aspects of the nature and extent of the ecological relationships between whales and the ecosystems in which they live. This advice is important to a number of other responsibilities of the Committee and the Commission has stated their interest in such work in a number of resolutions (IWC, 1999a; 2001b; 2002).

The Working Group's topics to address at this year's meeting were:

(1) review of ecosystem modelling efforts undertaken outside the IWC;
(2) explore how ecosystem models contribute to developing scenarios for simulation testing of the RMP; and
(3) review of other issues relevant to ecosystem modelling within the Committee.

The report of the Working Group on Ecosystem Modelling is given as Annex K1.

13.1 Review of ecosystem modelling efforts undertaken outside the IWC

13.1.1 Ecosystem modelling in the context of ecosystem-based fisheries management

SC/64/EM1 outlined several ecological questions relevant to whale populations that can be addressed by ecosystem models. These included: (1) what species and fisheries can potentially compete with whale feeding? (2) how would one evaluate the potential magnitude of such competition? (3) what are the potential indirect food web effects on whales? (4) what are the ecosystem tradeoffs that most warrant evaluation? (5) what are the best scenarios (to model) to mitigate any of these concerns? and (6) how well do such (simulated) scenarios perform? The author also provided a review of the major classes of ecosystem model being employed globally in an ecosystem-based management context, provided a map of ecosystem models as they relate to these and similar questions, and described how global best practices are being adopted in the use of these ecosystem models. A key message was that the choice of

[24] *http://www.marinedebris.noaa.gov/info/japanfaqs.html.*

model depends strongly on the questions being addressed. It is probably better to start with the simple multi-species models (with few components) or extended single-species models. The more complex multi-species models, food-web models or whole-system models are more suited to addressing broader questions.

SC/64/EM2 reported on efforts to place initial quantitative bounds on consumption estimates for a suite of marine mammals in the northeast US large marine ecosystem, including baleen whales, odontocetes and seals. Daily individual consumption rates were compiled from the literature and explored with sensitivity analyses to derive feasible ranges for each species which then could be raised to annual population-level consumption based on existing population abundance estimates. The results indicated that marine mammal consumption in this region might be similar in magnitude to commercial fishery landings for small pelagic and groundfish prey groups, although previous studies have indicated that targeted sizes may differ. Marine mammals probably consume as much prey as finfish predators, thus meriting continued evaluation despite the inherently wide confidence intervals of their consumption estimates.

The Committee **welcomes** this information, noting that with the move toward ecosystem-based management, consumption by marine mammals warrants inclusion as a source of natural mortality in assessments of mammal prey stocks. It also noted that reference points for marine mammal management, such Optimum Sustainable Production, had yet to be suitably defined in a multi-species context.

13.1.2 Ecosystem models of the effect on predators of fishing forage fish

Recent studies (Cury *et al.*, 2008; Fulton *et al.*, 2011; Pikitch *et al.*, 2012) have addressed the effects of exploitation of forage fish on their predators in several ecosystems, indicating that fishing of forage fish down to their MSY level can have major impacts on predators, including birds and marine mammals. In view of the importance of this issue to cetaceans, the Committee **agrees** that this should be a priority topic for next year.

13.1.3 Status update on NAMMCO ecosystem modelling

At last year's meeting, the Committee received an update on NAMMCO's initiative to implement a series of ecosystem modelling exercises in the Barents Sea and the waters around Iceland. This year, the Committee was informed that the efforts have been delayed due to a lack of funding. However, the Committee remains interested in receiving information on these exercises as it becomes available.

13.2 Explore how ecosystem models contribute to developing scenarios for simulation testing of the RMP

Recent discussions in the sub-committee on the RMP (e.g. IWC, 2011g) on variation of *r* and *K* values in the face of environmental variability has shown that it can be useful to try to model the effects of food availability more explicitly, because this can have implications for the effects of prey abundance on whale population dynamics. The Committee **emphasises** the value of implementing this in small steps rather than going immediately to complex models and **agrees** that consideration of simple models of whales and prey should be a priority issue for next year.

13.3 Review of other issues relevant to ecosystem modelling within the Committee

13.3.1 Update on Antarctic minke whale body condition analyses

Last year, the Committee discussed issues regarding the statistical significance of a decline (of about 0.2mm per year) in mean blubber thickness of Antarctic minke whales over the 18-year JARPA period reported by Konishi *et al.* (2008). The issues had been raised by de La Mare (2011), who found that the methods used by Konishi *et al.* (2008) could result in spurious apparent significance of trends because the nature of the sampling process and the associated components of the variance structure of the data were not taken into account. A reanalysis of the data at last year's meeting by Skaug (2012) using mixed-effect regression models to account for some of the additional variance structure resulted in a much higher variance of the estimated trend, but the point estimate changed little, and the estimated trend was still significant. Given the relevance of body condition indices to its work, the Committee agreed that further analysis of the data was warranted to determine: (1) whether the models fitted so far captured all the main features of the data; and (2) whether the estimate of trend (whose confidence limits using the best fitting model ranged from near zero to values that could be of appreciable biological significance) could be made more precise. The Committee requested, *inter alia*, results from analysing the two sexes separately and the inclusion of slopes by latitudinal band as a random effect. It also suggested that the authors of de la Mare (2011) and Konishi *et al.* (2008), apply for access to the data under Procedure B of the Data Availability Agreement, so that further analyses of these data could be reviewed by the Committee this year.

This year, de la Mare reported that he had applied for access to data through the Data Access Group but that a mutually satisfactory agreement was not reached. The generic data access questions raised in this case is discussed under Item 24. Pastene noted that Japan had offered to make available all data that had been requested by the Committee last year under the conditions of Procedure B (see Attachment B of SC/64/SCP1). De la Mare responded that conditions attached to the offer were in his opinion not in accordance with Data Access Agreement Protocol B and so were unacceptable.

In SC/64/EM3, he also presented an analysis of sex ratio and female length at 50% maturity using the JARPA data available in the IWC's catch database that showed unlikely trends and much higher levels of variability than would be expected in these parameters from a biological population. He noted that this indicated the presence of 'lurking variables' that had important effects on the dependent variable but that were not included in the predictor variables under consideration. Similar adverse effects could be present in the analyses of body condition described above, with possible sources of unaccounted variance including inter-annual variability in the locations and dates on which whales were taken, the spatial distributions of one or more biological populations and the co-effects of seasonality by sex and reproductive state. Using a statistical simulation of catches along random transects, SC/64/EM3 further showed that standard errors calculated using individual animals as the sample size underestimates the true variability because of spatial/temporal pseudo-replication, and that transects are the basic sampling units, not the individual catches.

There was considerable discussion of SC/64/EM3 and the implications for inferences on biological parameters derived from JARPA data. Some members emphasised that failing to estimate the variance associated with random transect placement means that the variances in the analyses of biological parameters will be underestimated such that hypothesis tests will be invalid. They further noted that the reported catch locations in the IWC database show that clearly identifiable transects that can be treated as replicates have not been realised and where transects are identifiable they have not been traversed in random time order. Consequently these members considered that the conditions for the appropriate analysis of the data have not been met.

Other members considered that non-independence can be accounted for by using jack-knife methods, as was done during last year's meeting with the blubber thickness data, using one year as the jack-knifing unit (IWC, 2012n). This approach showed that while the estimated SE increased from 0.0225 to 0.0836 on the regression slope (-0.213 mm/yr^{-1}), the slope estimate itself did not change and thus was still significantly different from zero at the 5% level. This jack-knife result should, according to these members, take care of concerns about dependence between observations. In addition, as mentioned above, mixed-effects models were also applied during last year's meeting to account for some of the additional variance structure resulting in a best model (based on the AIC criterion) with a slope of -0.19mm/yr^{-1} and SE=0.07; (Skaug, 2012, pp.259-62). In discussion, these members understood de la Mare to have claimed that these results did not take care of all possibilities for statistical dependence between whales (e.g. whales sampled on the same track line), but they considered it highly unlikely that such dependence could be so large as to destroy the findings of negative trends in blubber thickness, fat weight, girth or weight of stomach contents.

The Committee noted that valid conclusions can often be drawn from non-random samples as long as this is accounted for in the analysis. It further **recommends** that the authors of Konishi *et al.* (2008) investigate independence issues by using mixed-effects models with trackline as a random effect to address the concerns raised above. These authors will consider carrying out such analyses before next year's meeting.

13.3.2 Other issues

A decline in energy storage in Antarctic minke whales over almost two decades (Konishi *et al.*, 2008) suggests that food availability may have been declining recently. To test this hypothesis, at this year's meeting Konishi presented a paper (Konishi *et al.*, In review) that examined whether there was any annual trend in the stomach contents of the whales using catch data from 20 seasons in JARPA and JARPA II (1990/91-2009/10). Results from linear mixed-effects analyses showed a 39% (95% CI 3.2-47.3%) decrease in the weight of stomach contents over the 20 years. A similar pattern was found in both males and females, except in the case of females sampled at higher latitude (particularly in the Ross Sea), suggesting a decrease in the availability of Antarctic krill for Antarctic minke whales in the lower latitudinal range of the JARPA/JARPA II research area. However, prey availability has not changed in the Ross Sea, where both Antarctic krill (*Euphausia superba*) and ice krill (*E. crystallorophias*) are available. The decrease in Antarctic krill availability could be due to environmental changes or to an increase in the abundance of other krill-feeding predators. The latter appears more likely, given the rapid recovery of the humpback whale in the area and the fact that humpback whales are not found in the Ross Sea, where no change in prey availability was observed for minke whales.

There was considerable discussion of this paper, focusing on two main areas:

(1) statistical issues, similar in nature to those discussed above with respect to the blubber thickness analysis, in particular as to whether the analysis takes account of all components of variance and whether the statistical significance of the apparent trends is reliable; and
(2) the biological issues associated with the relationship between stomach fullness and food intake and between stomach fullness and prey availability.

With respect to the statistical issues, members repeated many of the points summarised above with respect to the blubber thickness analysis and made a number of suggestions regarding additional statistical treatment of the data (see Annex K1). The Committee **recommends** that these analyses be conducted if possible.

With respect to the biological issues, some members noted the importance of considering the stomach evacuation rate and its relationship to the timing of feeding. The strong decline in mean stomach contents over the day, as shown in the results, is indicative that most feeding is occurring at night. It is possible to envisage a situation where high food abundance would lead to whales being satiated relatively early in the night, such that by the next day their stomachs are not very full. Conversely, during periods of lower food abundance, feeding may be spread over a longer period, such that more food tends to be found in the stomach during the day. Thus, the direction of the relationship between food availability or intake and observed stomach content weight is not obvious *a priori*. In response, other members drew attention to information such as the negative trend in blubber thickness, which supported the lower food availability hypothesis. Data collected during JARPA on the freshness of food in the forestomach may provide further information on the timing of feeding, and the Committee **recommends** that these data be analysed.

The Committee **agrees** that for an understanding of the possible relationships between food intake and stomach fullness, analyses of the consequences of the diurnal patterns of food intake should be reported. Furthermore, alternative models for stomach evacuation (such as linear and exponential models) should be examined. The Committee **agrees** to keep the issue on the agenda for next year and **encourages** submissions on this issue.

13.4 Review new information on ecosystem model skill assessment

No new information was available for discussion on this topic.

14. SMALL CETACEANS (SM)

The Committee has been discussing issues related to small cetaceans since the mid-1970s (IWC, 1976). Despite the differences of views over competency (IWC, 1993a, p.31), the Commission has agreed that the Committee should continue to consider this item (IWC, 1995a).

14.1 Review status of ziphiid whales in the North Pacific and northern Indian Ocean

The last worldwide assessment on the status of ziphiids was in 1988 (IWC, 1989). Last year the Committee reviewed the status of ziphiids in the North Atlantic and adjacent waters (IWC, 2012r, Annex L). At this meeting, the priority is to review the status of the ten beaked whale species in the North Pacific and northern Indian Ocean (see text table over page). Considerable information was submitted for the review and details can be found in Annex L (see table overleaf for agenda items). Only a general overview is given here.

Ziphiids in the North Pacific and northern Indian Ocean.

Beaked whale species	Distribution	Item in Annex L
Cuvier's	Worldwide except polar waters	3.1
Blainville's	Tropical and warm-temperate waters worldwide	3.5
Baird's	Cold-temperate waters of the North Pacific Ocean	3.2
Hubbs'	Cold-temperate waters of the North Pacific Ocean	3.4
Stejneger's	Cold-temperate waters of the North Pacific Ocean	3.9
Pygmy	Mainly in the Eastern Tropical Pacific (ETP)	3.8
Perrin's	Poorly known – few California specimens	3.7
Ginkgo-toothed	Poorly known – tropical and warm-temperate Indian and Pacific Oceans	3.6
Longman's	Poorly known – tropical and warm-temperate Indian and Pacific Oceans	3.3
Deraniyagala's	Poorly known – tropical and warm-temperate Indian and Pacific Oceans	3.10

SC/64/SM21 analysed passive archival acoustic data from across the North Pacific. Species-specific frequency modulated (FM) echolocation pulses made by Baird's, Blainville's, Cuvier's, Longman's and Deraniyagala's beaked whales at Palmyra Atoll, have been recorded and described, with visual confirmation of species identity. The species-specific features appear to be consistent within all sequences labelled to signal type level, making possible the discrimination of species. It was agreed that Cross Seamount was a good site to identify ginkgo-toothed beaked whale call signatures.

The Committee **welcomes** the report on the spatio-temporal distribution of species-specific acoustic echo-location signals of beaked whales in the North Pacific. Future research using visual sightings with biopsies in conjunction with acoustic recordings will be necessary to link several species and signal types.

SC/64/SM11 provided estimates of abundance and trends for Baird's beaked whale, Cuvier's beaked whale and *Mesoplodon* spp. in the California Current from 1991-2008 using a Bayesian hierarchical modelling approach. The analysis indicated declining abundance for Cuvier's beaked whale (2.9% per year) and *Mesoplodon* spp. (7.0% per year) in the study area but no evidence of a trend for Baird's beaked whales. The Committee **agrees** that these results should be interpreted cautiously given the variability in ocean conditions in the region since the early 1990s. In the 1990s, both *M. stejnegeri* and *M. carlhubbsi* occurred as far south as San Diego, but since the late 1990s, previously rare warm-water ziphiids appear to have moved into the area which is thought to be near the northern end of their range. An analysis of the pattern of strandings of *Ziphius* along the US west coast might be informative for evaluating the apparent decline suggested in SC/64/SM11.

SC/64/SM13 summarised records of five documented ziphiid species in the EEZ of Costa Rica. There are only a few scattered records of all species except Cuvier's beaked whale, which is sighted relatively frequently, and *Mesoplodon* sp. A (almost certainly *M. peruvianus*), which could mean Costa Rican waters are a significant part of the range of this poorly known mesoplodont.

14.1.1 Cuvier's beaked whale (Ziphius cavirostris)

SC/64/SM34 reviewed current knowledge of Cuvier's beaked whale in the North Pacific and northern Indian Ocean. It occurs in deep waters worldwide and ranges from equatorial tropical to cold-temperate waters in the North Pacific, north to the Gulf of Alaska, along the Aleutian and Commander Islands in the Bering and Okhotsk Seas. It is commonly found where the steep continental slope occurs close to shore, such as around the Hawaiian Islands, San Clemente Island (California), Isla de Guadalupe (Mexico – see SC/64/SM18) and the Aleutian Islands.

Few estimates of density or abundance are available, primarily due to the rarity and difficulty of detecting and identifying beaked whales. In addition large-scale cetacean abundance surveys are often focused in areas such as continental shelf waters where beaked whales usually do not occur.

14.1.1.1 CONCLUSIONS AND OTHER CONSIDERATIONS OF STATUS

Cuvier's beaked whale is classified in the IUCN Red List as of Least Concern. Abundance estimates are available only for the Eastern Tropical Pacific, the Hawaii EEZ and the west coast of the USA (to 300 n.miles offshore). Numbers in the California Current appear to have declined in recent years. Some anthropogenic mortality is known from fisheries in waters off California and Japan and probably occurs elsewhere (e.g. in driftnet fisheries off Mexico). This species is vulnerable to noise produced by naval sonar and seismic research. Research priority should be given to understanding population trends off California and studying population structure. The Committee **agrees** that there is no basis for revising the status of Cuvier's beaked whale at the species or population level at this time.

14.1.2 Baird's beaked whale (Berardius bairdii)

Reviews of published (and some unpublished) information on Baird's beaked whales in the North Pacific were provided in SC/64/SM8 and by Brownell and Allen. Additional information on distribution and abundance was provided in SC/64/SM5, SM11 and SM21 and by Wade.

Baird's beaked whale is endemic to the cold temperate waters of the North Pacific. It appears to be more abundant in the western than the eastern part of the basin despite the long history of exploitation in the west and relatively little exploitation in the east.

SC/64/SM5 reported on a study of Baird's beaked whales at the Commander Islands in the western Bering Sea. Baird's beaked whales were found within about 12km of the coast, and mostly on the continental slope at depths of 100-1,000m (maximum depth at sighting about 3,000m). A total of 78 individuals was identified. Photo-ID confirmed associations over several years and the authors suggested that Baird's beaked whales live in a fission-fusion society. Evidence of killer whale predation was provided. More than half of the whales had marks the authors attributed to fishing gear and 3/75 had scars of possible anthropogenic origin, one apparently from harpooning.

Wade provided information on Baird's beaked whale sightings (n=25) made during nine killer whale surveys in nearshore waters of the Aleutian Islands, between 2001 and 2010. Baird's beaked whales were seen on every survey, generally close to the continental shelf edge break, in deeper waters on the continental slope. The extent of predation by killer whales on beaked whales might be considerable and ongoing stable fatty acid analyses may elucidate the importance of beaked whales in their diet.

14.1.2.1 LIFE HISTORY PARAMETERS

There are considerable data on life history parameters obtained from carcasses of whales taken on the Chiba ground and processed at the Wadaura station in the 1975 and 1985-

87 summer seasons (Kasuya *et al.*, 1997). This information has been interpreted assuming annual deposition of tooth growth layers (Kasuya, 1977). Full details are given in Annex L, item 3.2.4.

14.1.2.2 ABUNDANCE AND TRENDS
Abundance estimates for Baird's beaked whales are given in table 2 and item 3.2.5 of Annex L.

14.1.2.3 TAKES INCLUDING BYCATCH
Baird's beaked whales have been hunted by hand harpoon in Japan since around 1600 and by Norwegian-type whaling since 1907. Kasuya (2011) reviewed published information on the Baird's beaked whale fishery in the Chiba Prefecture.

Recent catch statistics by Japanese small-type whaling are summarised in Annex L, table 3. Official statistics since 1932, except 1943-46, are given in Annex L, Appendix 2. The reported statistics for the 1950s may be unreliable because of the likely inclusion of illegally caught and misreported sperm whales at Wadaura, Chiba between 1959 and 1974 (Kasuya, 2011). Similarly, illegal catches of sperm whales by small-type whalers in Ayukawa on the Pacific coast of northern Honshu (Kondo and Kasuya, 2002) may have been reported as Baird's beaked whales, thus contributing to the surprisingly high numbers of the latter reported in the catch statistics in the 1950s and 1960s. The reported annual take of Baird's beaked whales in Japan (mostly along the Pacific coast) ranged between 107 and 322 during the period 1950-69 (3,896 animals in 20 years).

The number of catcher boats operating for Baird's beaked whales off Chiba has been regulated by the prefectural government since 1920. The government introduced a licensing system to the small-type whale fishery in 1947 to limit the total number of boats operating. A voluntary quota system was introduced for Baird's beaked whales in 1983. The initial quota of 40 has since been increased to 66 (Annex L, table 3). In 1985, the Committee noted (IWC, 1986) that such a catch level represents about 1% of the estimated population size but was unable to determine whether this was sustainable. To investigate this question further it was agreed that studies on school structure would be desirable (IWC, 1986) - see above regarding the study in the Commander Islands. The Government of Japan has increased the quota several times and whaling operations have expanded since the late 1990s into the Sea of Japan (Appendix 1 and table 3 in Annex L).

In the eastern Pacific, small numbers of Baird's beaked whales were taken by whaling stations in California (15) and British Columbia (29) between 1956 and 1970 (Rice, 1974).

Five cases of stranded Baird's beaked whales in Japan were categorised as incidental fishery takes (table 4 in Annex L).

14.1.2.4 OTHER ACTUAL AND POTENTIAL THREATS
High concentrations of mercury, HDBPs and/or PCBs have been found in this species (Endo *et al.*, 2005; Endo *et al.*, 2003; Haraguchi *et al.*, 2006; also see SC/64/SM3). Concern has been raised since the accidents at Fukushima No.1 nuclear power plant but there is no evidence yet for exposure to Baird's beaked whales. Their range is mainly to the north of Fukushima.

14.1.2.5 CONCLUSIONS AND OTHER CONSIDERATIONS OF STATUS
The species is classified in the IUCN Red List as Data Deficient. Abundance estimates for the US west coast reported in SC/64/SM11 showed no trend for the period 1991-2008. The three populations off Japan have been assessed as Rare by the Japan Fisheries Agency and Mammalogical Society of Japan. The Committee **agrees** that there is no basis for revising the status of the Baird's beaked whale at the species or population level at this time.

The Committee **recommends** the following.

(1) It is especially important to clarify population structure and geographical boundaries of the stocks off Japan, particularly as long as hunting continues there.
(2) Improved and updated abundance estimates are needed for each population, and trends in abundance should be assessed. These needs particularly apply to exploited stocks.
(3) Better understanding is needed of the movements of animals from the respective stocks into and out of the three sea areas of Japan (Sea of Japan, Sea of Okhotsk, Pacific coast).
(4) The study in the Commander Islands (SC/64/SM5) should be expanded to include biopsy sampling for determination of sex and paternity and maternity in order to support studies of social and population structure, as well as satellite tagging to learn about movements and stock relations.
(5) The limited information suggests a peculiar life history and social structure - it is uncertain whether the characteristics of Baird's beaked whales are common, rare or even unique among the *Ziphiidae*, but further studies such as those recently initiated in the Commander and Aleutian Islands are encouraged to continue.

14.1.3 Longman's beaked whale (Indopacetus pacificus)
Published information on this species was reviewed in SC/64/SM26. It is probably endemic to tropical waters of the Indian and Pacific Oceans. The west- and southernmost record is Natal, South Africa, the northernmost is Hakodate, Hokkaido, Japan, and the easternmost is Maui, Hawaii.

Two stranded specimens in northeastern Taiwan on 22 July 2005, provided the first genetic and external morphological descriptions in the western Pacific (SC/64/SM32).

14.1.3.1 CONCLUSIONS AND OTHER CONSIDERATIONS OF STATUS
Longman's beaked whale is classified in the IUCN Red List as Data Deficient. The Committee **agrees** that there is no basis for revising the status of Longman's beaked whale at either the species or population level as no abundance estimates are available, except around the Hawaiian Islands, and there is no information on trends. The species is best known from the western North Pacific. Some anthropogenic mortality is known to have occurred in fisheries around Sri Lanka and strandings in Taiwan may have been associated with naval activities. Ingestion of plastic debris and exposure to morbillivirus are also of concern.

No high-priority research needs were identified but efforts are needed to better document the species' overall range, especially in the Indian Ocean. Continued efforts are encouraged to investigate and sample stranded animals at every opportunity following standardised protocols for beaked whale necropsy. Necropsy results should be made available in the literature and in relevant publicly accessible databases as quickly as possible.

14.1.4 Hubbs' beaked whale (Mesoplodon carlhubbsi)
SC/64/SM27 reviewed published information on Hubbs' beaked whale from the seas around Japan and from North America (<60 records). It is endemic to the North Pacific

and found in cold temperate currents off Japan and along the west coast of the USA and southern British Columbia, Canada. It has rarely been reported at sea.

14.1.4.1 CONCLUSIONS AND OTHER CONSIDERATIONS OF STATUS

Hubbs' beaked whale is classified in the IUCN Red List as Data Deficient. The Committee **agrees** that there is no basis for revising the status of Hubbs' beaked whale at either the species or population level. Some concern was expressed at the apparent decline of mesoplodonts off the US west coast (SC/64/SM11) as this probably includes Hubbs' beaked whales. No species-specific abundance estimates are available. Some anthropogenic mortality is known to occur in fisheries off both Japan and the USA and these whales may be vulnerable to anthropogenic noise from naval sonar and seismic research.

The Committee **agrees** that priority should be given to studies of possible population differences between Japan and the USA (genetics primarily but also external and internal parasites and cookie-cutter sharks scars). Acoustic studies (e.g. SC/64/SM21) may help to better determine the range of Hubbs' beaked whale, if a species-specific signal is found.

14.1.5 Blainville's beaked whale (M. densirostris)

Published information on this species (primarily from strandings) was reviewed in SC/64/SM33. This has the most extensive distribution of any *Mesoplodon*. Its acoustic signal type (the same as in the North Atlantic) was the predominant signal type in the Pacific Islands region (SC/64/SM21). It is found in tropical and warm temperate waters of all oceans, including deep offshore waters, tropical oceanic archipelagos and continental or insular coasts bordered by warm waters. There are no records from polar or other high latitude regions. It is reported infrequently at sea and positive field identification can be difficult unless key diagnostic characters of the head are observed.

14.1.5.1 CONCLUSIONS AND OTHER CONSIDERATIONS OF STATUS

Blainville's beaked whale is classified in the IUCN Red List as Data Deficient. The Committee **agrees** that there is no basis for revising the status of Blainville's beaked whale at either the species or population level. Some anthropogenic mortality is known to occur in fisheries off both Japan and the USA and this species may also be vulnerable to anthropogenic noise from naval sonar and seismic research.

In addition to the general recommendations under Annex K, item 3.12, the Committee **recommends** expanded photo-ID and tagging efforts in Hawaii to monitor movement patterns (seasonal as well as ranges) to determine whether there is site fidelity to specific types of habitat.

14.1.6 Ginkgo-toothed beaked whale (M. ginkgodens)

There is only limited information on this species which is found in warm temperate and tropical waters of the Pacific and westward into the Indian Ocean. It is classified in the IUCN Red List as Data Deficient. The Committee **agrees** that there is no basis for revising the status of the ginkgo-toothed beaked whale at either the species or population level. No abundance estimates exist. Some anthropogenic mortality is known from fisheries in at least Japan, Sri Lanka, Taiwan and Micronesia, and from anthropogenic noise from naval sonar (Wang and Yang, 2006). It is important to confirm the species identifications of all available specimens because a number have been misidentified in the past. Its status and abundance in its apparent 'hotspot' around southern Japan and Taiwan should be investigated.

14.1.7 Perrin's beaked whale (M. perrini)

SC/64/SM30 reviewed the existing information on Perrin's beaked whale. Very little is known about this species that was described in 2002 by Dalebout *et al.* (2002) based on five stranded specimens from south and central California – it remains known only from strandings in California and may have the most restricted range of any species of *Mespolodon*. Many or most of the unidentified mesoplodonts observed in ship surveys off California (SC/64/SM11) may be Perrin's beaked whales.

The species is classified in the IUCN Red List as Data Deficient. The Committee **agrees** that there is no basis for revising the status of Perrin's beaked whale at either the species or population level. As with all of the beaked whales, Perrin's beaked whales are probably at risk from anthropogenic noise produced by military sonar and seismic surveys as well as to fishery bycatch in areas of overlap. There is a need is to determine distribution and abundance in the eastern North Pacific including opportunistic biopsy sampling and correlated acoustic sampling.

14.1.8 Pygmy beaked whale (M. peruvianus)

SC/64/SM30 reviewed the existing information on pygmy beaked whales, which appear to be endemic to the eastern tropical Pacific. Most sightings are from the 'Eastern Pacific Warm Pool', an area with sea surface temperatures >27.5°C (Fiedler and Talley, 2006). It may be particularly abundant in the southern Gulf of California, Mexico (e.g. Ferguson *et al.*, 2006). There are a few records from Mexico (Urban-R, 2010) and it may be relatively common off Costa Rica (SC/64/SM13). The northernmost record is Moss Landing, California, the southernmost record in the eastern Pacific is from northern Chile (Sanino *et al.*, 2007) and the only record outside the eastern Pacific was from South Island, New Zealand (Baker and van Helden, 1999). Whether this latter specimen is indicative of a wider distribution for this species, or just an errant individual, is uncertain.

14.1.8.1 CONCLUSIONS AND OTHER CONSIDERATIONS OF STATUS

This species seems be fairly common within its range (Ferguson and Barlow, 2001). It is classified in the IUCN Red List as Data Deficient. The Committee **agrees** that there is no basis for revising the status of pygmy beaked whale at either the species or population level given the sparseness of information. Confirmation is needed that *Mesoplodon* sp. A is *M. peruvianus*; while biopsy samples (male) seem unlikely, a colour-pattern description of a freshly stranded adult male *M. peruvianus* would suffice. The southern Gulf of California seems to be a promising region for either of these events.

14.1.9 Stejneger's beaked whale (M. stejnegeri)

SC/64/SM25 reviewed information on this species, mainly from waters around Japan but including data from North America. It is endemic to the cold temperate North Pacific and has not been reported from any of the central Pacific islands. Four mass strandings occurred in Kuluk Bay, Alaska between 1975 and 1989 (Walker and Hanson, 1999). It is the most commonly stranded ziphiid in Japan although rare on the Pacific coast of Japan (Brownell *et al.*, 2004). Park (1999) reported five strandings and two incidental catches along the east coast of South Korea (35° to 38°N).

The presence of cookie-cutter shark bites on animals around the Aleutian Islands but not the Sea of Japan, suggest some population structure in the central and western North Pacific. Brownell *et al.* (2004) suggest that the northern Sea of Japan should be considered as a provisional management unit.

14.1.9.1 CONCLUSIONS AND OTHER CONSIDERATIONS OF STATUS

Stejneger's beaked whale is classified in the IUCN Red List as Data Deficient. The Committee **agrees** that there is no basis for revising the status of Stejneger's beaked whale at either the species or population level. No species-specific abundance estimates are available. Some anthropogenic mortality is known to occur in fisheries off both Japan and the USA and at least one case of a ship strike has been confirmed. The mass strandings in the Aleutian Islands were suspected of being related to naval sonar.

In addition to the general recommendations under Item 14.1.11, the Committee **recommends** regular and extensive sample collection from stranded or bycaught specimens (especially off Japan) in order to better understand the species' ecology, life history and vulnerability to threats. Genetic research is needed to determine whether western and eastern populations can be differentiated. Better understanding of its biology and abundance in the apparent 'hot spot' in the Sea of Japan off Honshu could be accomplished by: (1) strengthening the stranding programme in order to collect specimens in fresher condition; (2) acoustic monitoring; and (3) small-scale surveys to assess abundance.

14.1.10 Deraniyagala's beaked whale

SC/64/SM3 presented new genetic and morphological data supporting the recognition of a previously described but unnamed *Mesoplodon* sp. in the tropical Indo-Pacific. Genetic identification has related new specimens, including those initially described by Baker *et al.* (2007), to a type specimen in Colombo, Sri Lanka described as *M. hotaula*, in 1963. Known from at least seven specimens it is genetically distinct but closely related to (and possibly conspecific with) *M. ginkgodens.* Its distribution seems to be tropical in both the Indian and Pacific Oceans. SC/64/SM3 argued that available evidence was sufficient to accept the revised taxon as a new subspecies of *M. ginkgodens* and that further characterisation could result in the resurrection of *M. hotaula* Deraniyagala, 1963 as a full species. The Committee suggested the provisional common name 'Deraniyagala's beaked whale' for this taxon, in recognition of the original description.

Further genetic investigation, including biopsy sampling of live animals, is required to clarify the systematics and taxonomy. Visual and acoustic reports from around Palmyra Atoll have been attributed to this new taxon (see SC/64/SM21) and this area clearly provides the opportunity to collect fresh tissue samples for genome-level analyses.

SC/64/SM4 reported on the species identity and local use of Deraniyagala's beaked whales (and Blainville's and Cuvier's beaked whales) in the Gilbert Islands, Republic of Kiribati. This investigation, conducted with the help of government agencies, visited several of the outer Gilbert Islands in June-July 2009 and collected bones and artefacts.

It is important to obtain new specimen material from oceanic islands and atolls in the central tropical Pacific and and to confirming the identities and provenances of existing museum specimens attributed to *M. ginkgodens*. Consideration should be given to the possibility that there are island-associated nearshore populations that are geographically and demographically isolated or semi-isolated from offshore populations of both Deraniyagala's beaked whales and ginkgo-toothed beaked whales, as is the case with Blainville's beaked whales.

Almost nothing is known about overall distribution, population structure, life history, abundance or takes of Deraniyagala's beaked whales, with the exception of those in Kiribati (SC/64/SM4). The five beaked whale strandings from Palmyra Atoll and Kingman Reef between 2002 and 2007 is high for such a small area and high compared to the number of beaked whale strandings reported on other Pacific Islands.

14.1.10.1 CONCLUSIONS AND OTHER CONSIDERATIONS OF STATUS

No IUCN Red List entry has been made for Deraniyagala's beaked whale at either the species or population level. The Committee **agrees** that there was insufficient data to assess this status at either the species of population level. The Committee expressed concern about the apparently high numbers of strandings around Palmyra Atoll in recent years. Deraniyagala's beaked whales are probably vulnerable to sound from naval sonar and seismic research, similar to other beaked whales. Assuming that the beaked whale recorded both acoustically and visually around Palmyra Atoll is Deraniyagala's beaked whale, the first priority is to make this determination genetically.

14.1.11 Common issues and threats

14.1.11.1 MILITARY SONAR AND OTHER NOISE SOURCES

Evidence of gas bubble lesions (gas embolism) and fat emboli have been reported at necropsy in beaked whales from atypical mass stranding events (MSEs), which were coincidental with nearby use of mid-frequency sonar (Fernandez *et al.*, 2004). Exposure to sonar may alter the behaviour and/or physiology of beaked whales, potentially resulting in decompression sickness (DCS) in some circumstances.

Bernaldo de Quirós and Fernandez Rodriguez (2011) studied gas presence and composition in order to compare decompression vs. decomposition gases present at necropsy. Bubbles alone cannot be used to determine cause of death and it is important to differentiate between gas embolism and putrefaction gases. They recommended scoring gas bubble presence and sampling bubbles for gas composition analysis within 24 hours, but preferably within 12 hours, to minimise the masking effects of putrefaction gases.

The Committee **recommends** that groups working on mass strandings make all reasonable efforts to examine dead animals within 12 hours (or at most 24 hours) after death. Response teams should, if at all possible, include a veterinarian, a veterinary pathologist or a responder with experience in necropsy and sample collection. Routine necropsy protocols should include examination of bubbles present in tissues, scoring relative prevalence and sampling for gas composition analysis, particularly to detect and describe intravascular and peri-renal subcapsular emphysema bubbles.

The Committee took note of the latest investigations of MSEs in the Canary Islands, Spain associated with the use of naval sonar (Fernandez *et al.*, 2004). No further atypical MSEs have occurred since international naval exercises ended in 2004 following a recommendation of the parliament of the European Union and a Spanish government resolution banning the use of military sonar around the Canary Islands. This supports the inference that the atypical MSEs before the ban were caused by mid-frequency sonar.

Noting the ample evidence about the vulnerability of beaked whales to military sonar and seismic surveys and the potential for impacts at the population level (including not only animals that strand and are detected but also the potentially large number that die at sea and do not strand), the Committee **strongly recommends** that military exercises and seismic surveys should avoid areas of important habitat for beaked whales; that further effort should be made to mitigate their impacts; and that further efforts should be made to identify such areas (MacLeod and Mitchell, 2006; Cañadas *et al.*, 2011).

The Committee also reiterates two previous recommendations.

(1) The continuation and expansion of studies of how anthropogenic noise, especially from naval sonar and seismic survey airguns, affects ziphiids. These should include efforts to determine if and how vulnerability differs between species, habitat types, animal activities (e.g. travelling, foraging) etc.
(2) Collaborative arrangements with military and industry authorities should be made to ensure researchers have advance notice of sonar exercises, seismic surveys and other activities so that the possibility of beaked whale stranding events can be anticipated with enhanced beach surveillance etc.

14.1.11.2 MARINE DEBRIS
Available data from the North Pacific and northern Indian Ocean (SC/64/E10; Simmonds, 2012) indicates that beaked whales may be especially vulnerable to the ingestion of plastics and other marine debris; this can cause pathology and mortality. The population-level and long-term implications of the ingestion of plastic debris are unknown. The Committee **recommends** that this issue is further investigated via the collection, collation and analyses of relevant data from around the world concerning ingestion rates, debris types and associated pathology. It also **recommends** that standardised protocols are developed for pathology investigations. Consideration should also be given to investigating marine debris accumulation and associated processes in areas of important habitat for small cetaceans.

14.1.11.3 GENERAL RECOMMENDATIONS
The Committee **recommends** that for all North Pacific and northern Indian Ocean ziphiid species, further efforts are made to define population structure, delineate population boundaries, obtain estimates of abundance and identify and rank threats. Attention should be given to populations known or suspected to be small and/or exploited. The available evidence suggests that most ziphiid species occupy relatively narrow ecological niches and occur as local, largely isolated groups, which should be regarded as putative subpopulations (in the IUCN Red List sense).

The Committee **recommends** that more effort be made to investigate and validate methods of estimating population size for ziphiids, including those that incorporate passive acoustics for application in areas where the local species are acoustically distinguishable. Further data are needed to adjust density estimates from line transect surveys to account for visibility bias (given that these deep-diving whales spend relatively little time at the surface and species are difficult to distinguish) and for responsive movement. Consideration should also be given to interrupting line transect surveys (closing mode) in order to obtain photographs and biopsies as a way of reducing the 'unidentified ziphiid' component of abundance estimates.

Initial efforts have been made to map high-use areas for ziphiids on a global scale (MacLeod and Mitchell, 2006) to provide guidance for mitigation measures to reduce the risks from naval sonar and seismic survey operations. However, a more detailed examination is needed of these 'hotspots', including fine-scaled habitat characterisation and predictive habitat modelling. The Committee **recommends** that collaborative efforts similar to those described last year in Cañadas *et al.* (2011) be made by the relevant scientists and research groups in the North Pacific and northern Indian Ocean where anthropogenic sound is considered a problem.

Ziphiids are at risk of entangling in nets, especially pelagic driftnets, which tend to be deployed in or near their habitat. They are also known to get hooked or entangled in longline gear. The Committee **recommends** that methods be developed and applied to estimate fishery-related mortality, giving special attention to areas where there is direct evidence of incidental mortality as well as to areas where driftnetting and longlining operations overlap known concentrations of ziphiids.

Evidence of beaked whale population decline along the North American coast (SC/64/SM11) raised concern that beaked whales, and particularly resident populations, may be negatively affected by large-scale environmental change. The Committee **recommends** efforts be devoted to understanding impacts of changes in habitat on the distribution and abundance of beaked whales. This could involve pursuing an improved understanding of beaked whale feeding ecology and deep-water oceanographic processes as well as prey-community dynamics.

The Committee further **recommends** broad-scale collaborations to generate integrated results from analyses of genetic material, photograph collections and survey data. Particularly for *Mesoplodon* species, biopsies should be obtained from live animals to verify species identification. This is especially important for females and young males. Efforts are also needed to validate acoustic signatures of *Mesoplodon* species by collecting biopsies (and good photographs) along with acoustic recordings at sea.

14.2 Report on the voluntary fund for small cetacean conservation research

14.2.1 Status of the voluntary fund for small cetacean conservation research
In 2009, Australia made a generous donation toward the IWC Small Cetacean Conservation Research Fund of about £250,000 which enabled eight grant awards to research and conservation projects on small cetaceans (IWC, 2012r). At the Commission meeting in 2011 and during the interessional period, France, Italy, the UK and a number of NGOs provided extra funding of £73,000 which allowed: (1) the full funding of the two remaining projects recommended by the Committee in 2011; (2) support for invited participants in 2011 and 2012; and (3) a chance to start rebuilding the Fund. The Committee **thanks** the above governments and the NGOs for their generous contributions to the fund and hopes that the next Conservation Committee and Commission meetings will generate new funding that will allow another call for projects by the end of 2012.

14.2.2 Review on progress on funded projects
The Committee reviewed brief project reports on five of the nine projects selected in 2011 and received more extensive reports on three of them, which are presented in Annex L (Solomon Islands, under this item; franciscana, Item 14.3.3; Atlantic humpback dolphin, Item 14.3.5).

SC/64/SM23 presented preliminary results of an assessment of dolphins in the Solomon Islands where there is a long history of exploiting dolphins through traditional drive-hunts. More recently, the Indo-Pacific bottlenose dolphin (*Tursiops aduncus*), has been live-captured for export, with a current annual export quota of 50. This Committee as well as several intergovernmental bodies (CITES, CMS, IUCN, SPREP) have expressed concern in the past about the potential conservation implications of these removals.

The Committee expresses its appreciation for this work and acknowledges the constructive involvement of the Solomon Islands Fisheries and Environment Ministries in collaborating and providing support. The preliminary results reinforce previously expressed concerns regarding the sustainability of past and ongoing live-capture removals of *T. aduncus* from what appear to be small island-associated populations. The Committee **encourages** the authorities responsible for conservation management (e.g. under CITES) to carefully consider the information from this study. It recommends that efforts to integrate the current and historical photo-ID catalogues be pursued as a priority.

14.3 Progress on previous recommendations

14.3.1 Vaquita

The Committee has expressed its grave concern over the status of this species and its continuing decline over many years. Last year, the Committee was informed about the pilot phase of implementation of an acoustic monitoring programme to track future changes in vaquita abundance in the Upper Gulf of California (IWC, 2012y). SC/64/SM19 provided further information on the implementation of the scheme in the first full sampling season. An overall loss rate of 44% of the detectors resulted in data being available for 38 sampling sites within the refuge. Deployment of buoys is the only way to obtain year-round information so an alternative method of deployment that reduces loss must be found. An analysis of the acoustic encounter rates in 2008 (0.74 encounters/day, CV 0.44) compared to those from the current study in 2011 (0.58 encounters/day, CV 0.05) is indicative of further decline of the population since 2008, i.e. when strategies to reduce fishing effort by the Federal Government were already being implemented.

Jaramillo-Legorreta noted that redeployment of the array in late spring of 2012 was delayed because the presence of 87 boats fishing illegally within the refuge at that time presented too great a risk of loss of equipment; deployment was underway at the time of the Committee meeting.

The sub-committee considered the report[25] of the fourth Meeting of the International Committee for the Recovery of Vaquita (CIRVA) held in Ensenada, Mexico from 20-23 February 2012. The role of CIRVA has been recognised by the Government of Mexico in the agreement for the creation of the Vaquita Protection Refuge and in the current federal Action Program for the Conservation of Vaquita (PACE-Vaquita). Hence, the recommendations of CIRVA are important in terms of driving recovery actions. The report notes that the population has continued to decline, with an estimated reduction of nearly 60% between 1997 and 2008 and possibly as few as 220 porpoises remaining in 2008 (CIRVA, 2012). The report is discussed in detail in Annex L.

CIRVA's assessment of progress is that switch-out programmes (conversion to vaquita-safe gear) have been poor with only a very small proportion of the total fleet using such gear. Fishermen using such alternative trawl gear would have great difficulty operating safely in the middle of the large gillnet fleet. A working group has been engaged in a public process to amend the Mexican Official Standard 002-PESCA that regulates shrimp fishing. A three-year process beginning in 2013/14 to ban shrimp gillnets and exchange them for the new small artisanal trawl net design has been approved but not yet published in the Federal Register.

Details on the CIRVA recommendations are given in Annex L and the Committee **strongly endorses** these recommendations.

At last year's meeting the Committee concluded, as it has in several previous meetings, that the only reliable solution for vaquita conservation is to eliminate vaquita bycatch by replacing gillnets with alternative fishing gear. In a detailed recommendation, the Committee strongly supported robust gear trials to assess alternative gear effectiveness and economic viability (IWC, 2012r).

The Committee again **reiterates its extreme concern** for the status of this species and, as stated in 2011 (IWC, 2012r), **reaffirms** that the only reliable approach for saving the species is to eliminate vaquita bycatch by removing entangling gear from areas where the animals occur. It **strongly recommends** that, if extinction is to be avoided, all gillnets should be removed from the upper Gulf of California immediately. This is in accord with the Committee's strong recommendation made in 2009 (IWC, 2012f, p.66) regarding the extinction of the vaquita.

In light of reports on the successful development of an alternative shrimp trawl and the CIRVA recommendations summarised in Annex L, the Committee also **recommends** that vaquita conservation efforts focus on:

(1) expedited approval and adoption of the small shrimp trawls as an alternative to gillnets and prohibition of shrimp fishing with gillnets throughout the entire range of the vaquita; and
(2) continued research on technologies to replace gillnetting for finfish or otherwise to remove all gillnets from the vaquita's entire range.

In this regard the Committee **notes** the ongoing project funded under the Voluntary Fund for Small Cetacean Conservation Research 'Supporting the assessment of alternative fishing gears for replacing gillnets that cause bycatch of vaquita (*Phocoena sinus*) in the Upper Gulf of California, Mexico' and **looks forward** to a progress report at next year's meeting.

14.3.2 Harbour porpoise

In 2001, the Committee acknowledged the efforts by ASCOBANS to address serious harbour porpoise bycatch problems in the Baltic, Kattegat/Belt and North Sea areas and encouraged further efforts in that regard (IWC, 2010h). Since then, the ASCOBANS Jastarnia Group has met and considered new analyses of survey and bycatch data, which have had the effect of reinforcing and increasing concern about sustainability of bycatch as well as other factors potentially affecting the porpoise populations in the region, including declines in availability of prey, ship traffic, construction work, seabed exploitation, contaminants, and diseases.

The Committee remains concerned about the status of harbour porpoises in the western Baltic, the Belt Seas and the Kattegat ('Gap' area, also known as Belt Sea stock according to the ASCOBANS Jastarnia Group). Although the abundance estimates for harbour porpoises from SCANS

[25] *http://www.iucn-csg.org/index.php/downloads/.*

and SCANS II were almost identical for the wider North Sea area, there was a southward shift in density distribution of porpoises between SCANS and SCANS II. However, there are indications of a possible decline in abundance in the Gap area. Bycatch is the major source of anthropogenic mortality and should be monitored and mitigated. EC Regulation 812/2004 does not adequately protect harbour porpoises from bycatch in this area because it requires bycatch monitoring only on boats >15m and pinger use only on boats >12m.

In the current state of scientific uncertainty, the Committee looks forward to receiving the results of a planned dedicated shipboard survey to be conducted in the Gap area in the summer of 2012 with the intention of obtaining a new abundance estimate.

The Committee recommends with regard to the Gap area to:

(1) assess porpoise bycatch levels;
(2) monitor porpoise abundance on a regular basis;
(3) introduce measures to mitigate bycatch and other anthropogenic mortality;
(4) monitor the health status of the porpoises;
(5) ensure all bycaught and stranded animals are reported and delivered to qualified institutions for necropsy and sampling; and
(6) implement the recovery plan for harbour porpoises which is currently being developed by ASCOBANS for the Gap area.

The Committee also repeats its longstanding concern regarding the critically endangered harbour porpoise population in the inner Baltic ('Baltic proper') and encourages all possible efforts to eliminate the bycatch there and address other factors that may be preventing this very small population's recovery. The current process of developing management plans for Special Areas of Conservation under the European Habitats Directive, offers a concrete chance to implement monitoring and mitigation as foreseen by the Jastarnia Plan. The Committee urges that effective monitoring and mitigation measures focusing on harbour porpoises be included in such national management plans.

14.3.3 Franciscana

SC/64/SM17 describes results of a project conducted with funding from the IWC Small Cetacean Conservation Fund. The main goal of the study was to assess distribution and obtain an abundance estimate of franciscanas inhabiting the region known as Franciscana Management Area I (FMA I), as recommended in IWC (2004a). In December 2011 and January 2012, design-based aerial surveys were conducted to assess distribution and to estimate abundance of franciscanas in FMA I. The fully corrected abundance estimate was 1,998 (CV=0.48, 95% CI: 796-5,013). The most recent (2001-02) estimate of incidental mortality in FMA I (Di Beneditto, 2003) corresponds to 5.5% of the estimated population size presented here. This indicates high and unsustainable bycatch if current mortality is similar to that in the early 2000s.

The Instituto Chico Mendes para a Conservacao da Biodiversidade (ICMBio) is the government agency responsible for establishing management and conservation strategies for endangered species in Brazil. In 2010, ICMBio published the 'National Action Plan for the Conservation of the Franciscana' (Di Beneditto *et al.*, 2010) and made a series of general recommendations for research and monitoring (summarised in Annex L) which the Committee endorsed.

The Committee further recommends the following with respect to FMA 1.

(1) Additional aerial surveys with increased sampling effort in order to:
    (a) produce more robust (lower CVs, estimates for the northern range of FMA I) population estimates;
    (b) further assess distribution (e.g. offshore limits, discontinuity); and
    (c) evaluate potential habitats that could be protected (e.g. by one or more no-take zones, marine protected areas) to improve conservation.
(2) Resume systematic and long-term bycatch monitoring in northern Rio de Janeiro and Espírito Santo, in order to produce more up-to-date mortality estimates.
(3) Studies should be conducted to assess areas within the range of the species where other human activities could pose a threat to the long-term viability of franciscanas in FMA I.

Melcon *et al.* (2012) illustrated the potential for the use of autonomous acoustic detectors or towed arrays designed specifically for the identification of porpoise-like signals (e.g. C-PODs or A-tags) in franciscana research.

14.3.4 Narwhal and white whale

Bjørge reported on progress towards organising and convening a proposed global review of the monodontids (IWC, 2001d, p. 279). The NAMMCO Secretariat has indicated interest in organising and convening such a review jointly with the IWC Scientific Committee and the intersessional correspondence group has identified a list of scientists interested in attending from four of the five range states (Norway, USA, Canada, Russia). Broader involvement of other scientific groups and individual scientists for a range-wide workshop or symposium on monodontid science may be appropriate. The involvement of groups as disparate as oceanaria and environmental NGOs as co-conveners might bring greater organisational motivation and financial resources to support such a workshop or symposium. The Committee recommends that a steering committee (Bjørge, Reeves, Suydam, a scientist from Canada, Donovan, and Aquarone from the NAMMCO Secretariat) be established to meet intersessionally to discuss these issues and report back at next year's meeting.

14.3.5 Atlantic humpback dolphin

SC/64/SM22 presents a brief update on the project funded by the IWC Small Cetacean Conservation Research Fund for Atlantic humpback dolphins in Gabon and Congo. There have been some challenges and shifts in focus and priorities over the last year, given boat failures and the discovery of a significant bycatch problem in Congo. As the project is ongoing, more complete reporting will be provided next year. The Committee thanks the authors for this preliminary report and expresses its appreciation for their perseverance in the face of the difficult challenges faced to date in this research.

14.3.6 River dolphins

IWC (2001d) recommended that 'scientists with appropriate theoretical and/or analytical skills should be directly involved in river cetacean studies, so that surveys result in statistically robust estimates of abundance'. In 2002, two biologists and two statisticians led a pilot survey (line and strip transect data and some photo-ID data) of boto (*Inia geoffrensis*) and tucuxi (*Sotalia fluviatilis*) in portions of the Amazon in Colombia and Peru (IWC, 2003d). SC/64/SM24 revisited this dataset and reported on preliminary analyses.

Participants drew attention to the existence of both older and more recent abundance estimates for the study area and suggested that a three-way comparison of abundance estimates would be of great value. The Committee expresses its appreciation to the Government of Brazil for supporting a proposed PhD studentship to work on this issue.

14.3.6.1 BOTO AND TUCUXI

Two largely sympatric endemic cetaceans, the tucuxi and the boto, inhabit the Amazon basin and both are increasingly killed for use as bait in the piracatinga (*Calophysus macropterus*) fishery (IWC, 2007g; 2008k; 2009g; 2012r). Catches in this fishery, primarily for export to Colombian markets but also for sale in domestic markets, have increased in Brazil in recent years. Alves *et al.* (2012) reported on an interview study with fishermen and traders, to elucidate interactions between fishermen and river dolphins, including the occurrence of illegal, indiscriminate killing and the growing trade in dolphin carcasses. In the view of fishermen, botos damage gear and steal (and also probably damage) catches. Botos are negatively portrayed in numerous traditional Amazonian folk myths and superstitions. These factors make them extremely unwanted or even hated and they are considered as pests. Now they have also become an economic resource as bait in the increasing piracatinga fishery. Additional information suggests that the true extent of the area of the piracatinga fishery and the area of direct takes is unclear, although the reported expansion of the piracatinga market and fishing effort add to concerns regarding the impacts on dolphins.

As previously noted (IWC, 2001d), the population status of botos and tucuxis has been assessed in only relatively small portions of their Amazonian range. The Committee reiterates its serious concerns with the potential population implications of the intentional killing of botos and tucuxis for use as bait in the piracatinga fishery. It welcomes the information provided at this year's meeting but notes that the true extent of this exploitation throughout Amazonia is poorly understood. It also emphasises that this relatively new and rapidly growing problem is in addition to other historical and ongoing threats to these dolphins, e.g. from incidental mortality in fisheries, vessel traffic, construction of hydroelectric dams, mining and other development.

In view of these concerns and the information gaps, the Committee recommends the organisation of an international scientific workshop involving scientists and managers from the range states, with the goals of addressing research and conservation priorities, standardising methodologies and planning long-term strategies. The following specific topics could be discussed at the workshop:

(1) geographic and temporal extent of the piracatinga fisheries and associated dolphin use;
(2) methods to assess abundance and mortality (rapid assessment as well as longer-term approaches);
(3) improved understanding of dolphin movements and habitat use (including population structure); and
(4) ways to reduce (or preferably eliminate) the pressure on dolphin populations from exploitation as bait for the piracatinga fishery.

The Committee agrees that the status of the boto and tucuxi should be added as a recurrent item on its agenda.

14.3.6.2 INDUS RIVER DOLPHIN

WWF-Pakistan hosted the Indus River Dolphin Conservation Strategy Planning Workshop in Lahore (Pakistan) last April. The objective was to lay the groundwork for development of a ten-year strategic action plan for conservation of endangered Indus River dolphins (*Platanista gangetica minor*), which are restricted to the Indus River system in Pakistan. Details can be found in Annex L, section 5.6.2.

14.3.6.3 MEKONG RIVER POPULATION OF IRRAWADDY DOLPHINS

A Mekong Irrawaddy Dolphin Conservation Workshop was held in Kratie, Cambodia, last January. The workshop was jointly hosted by the Commission for Dolphin Conservation and Development of Mekong River Dolphin Ecotourism, the Fisheries Administration of the Ministry of Agriculture, Forestry and Fisheries, and WWF-Cambodia. Participants reviewed the available evidence on possible causes of mortality of Irrawaddy dolphins in the Mekong in particular, the high and as-yet-unexplained level of calf mortality. Details can be found in Annex L, item 5.6.3.

All freshwater populations of Irrawaddy dolphins (*Orcaella brevirostris*) are listed on the IUCN Red List as Critically Endangered. The Mekong River population is estimated at 85 individuals (95% CI 78-91), excluding young calves (Ryan *et al.*, 2011) with recruitment close to zero. Although births occur, few animals survive to adulthood. The available information, suggests a slow decline (2.2^{-1} during the study period). If confirmed, the current population composition has serious implications for the long-term viability of the Mekong River population.

Last year, the Committee expressed grave concern about the rapid and at least partially unexplained decline of this riverine population. Unfortunately, the high mortality of young calves has continued as has the occasional mortality of adults from entanglement. The Committee **recognises** and **commends** Cambodian government agencies and WWF-Cambodia for making serious, concerted efforts since the last meeting to diagnose the cause(s) of calf mortality and further reduce the risk of entanglement. The Kratie Declaration[26] is a major step forward and the Committee recommended that it be fully implemented as quickly and as effectively as possible.

14.3.7 Killer whales

The Committee was pleased to receive information on the first photo-ID catalogue of killer whales in Adélie Land, East Antarctica (SC/64/SM6) as discussed in Annex L. This catalogue will be augmented in coming years and made available for regional matching and for a global Antarctic killer whale catalogue.

14.3.8 Clymene dolphin

The Committee was pleased to receive information a study underway on the first molecular characterisation of the Clymene dolphin (*Stenella clymene*) a recently rediscovered dolphin species. It has been suggested that the species could have had a hybrid origin, with *S. coeruleoalba* and *S. longirostris* acting as parental species (see Annex L).

14.4 Takes of small cetaceans

Annex L, Appendix 3 presents information on catches and associated quotas for small cetaceans from 1997-2010 obtained by Funahashi from the Japanese National Research Institute of Far Seas Fisheries website. The Secretariat developed the summary of catches of small cetaceans in 2009-11 from this year's national Progress Reports, where available.

[26] *http://www.iucn-csg.org/wp-content/uploads/2010/03/Kratie-Declaration-signed-with-appendices-1.pdf.*

The importance of these reports was noted, but concern was expressed that the Committee was not doing enough to take advantage of the significant information therein. The Committee **agrees** to explore intersessionally more specific terms of reference for evaluating direct take data, including the idea of developing case studies (e.g. assessing sustainability of bycatch in Europe) or other analyses from this information.

The Committee **thanks** Funahashi and the Secretariat for their work in compiling this information for the Scientific Committee each year and reiterated the importance of having complete and accurate catch and bycatch information and encourages all countries to submit data, appropriately qualified and annotated.

The Committee **expresses** its continuing concern about the lack of assessment of the exploited stock or stocks of killer whales in Greenland where reported catches were 14 in 2009 and 15 in 2010.

14.5 Local studies

SC/64/SM20 reported on the presence of long-beaked common dolphins in coastal waters of northern Colombia for the first time. These sightings extend the known range in the Caribbean, previously known primarily from the eastern Caribbean, some 700-800km.

Bolaños-Jiménez reported on: (1) work to gather records and sightings of killer whales in the Caribbean Sea and adjacent waters in collaboration with other North Atlantic killer whale studies and databases; (2) preliminary abundance estimates of Atlantic spotted and common bottlenose dolphins in the State of Aragua, central Venezuela, on the basis of mark-recapture models and photo-ID techniques as part of efforts to provide a stronger foundation for proper management and monitoring of dolphin-watching activities; and (3) new records of common dolphins in central-western Venezuela. Common dolphins have recently been recorded on the Colombian side of the Guajira Peninsula (SC/64/SM20).

SC/64/BC2 reported on unusual strandings of two species of oceanic dolphins on the Pacific coast of Costa Rica. The first was a mass stranding of 38 rough-toothed dolphins in 2002, 34 of which were returned to the sea. The second was of an adult female Fraser's dolphin in 2006. Both strandings are the only ones known for each of these species in Costa Rica.

SC/64/SM10 reported on studies to identify critical habitats for coastal pantropical spotted dolphins in Golfo Dulce, Costa Rica, as the foundation of the design and implementation of Marine Spatial Planning and Marine Protected Areas. The current study investigates the underlying behavioural mechanisms that govern patterns of niche differentiation and the resulting conservation implications.

The Committee expresses its gratitude to the presenters of local research papers and noted that such work to establish baselines, distribution records, and habitat requirements is essential to addressing the concerns of the Committee.

14.6 Hector's dolphins

Slooten reported on a number of recent findings and processes in New Zealand concerning Hector's dolphins. Bycatch in gillnet and trawl fisheries is the most serious threat to this endangered species. A substantial increase in survival rates (5.4%yr^{-1}) has been detected in one of the protected areas created to reduce the overlap between dolphins and these fishing methods (Gormley *et al.*, 2012). The Banks Peninsula population was declining at approximately 6%yr^{-1} before 2008 and is now declining at about 1%yr^{-1} (Gormley *et al.*, 2012; Slooten and Dawson, 2010). The population was predicted to recover if the boundaries of the protected areas were extended to the 100m depth contour. Slooten explained that the survival rate increase demonstrates that protected areas can work if: (1) they are large enough and in the right place; (2) key threats are managed by removing rather than displacing them; (3) no new threats are added (e.g. in this example marine mining, tidal energy generation); and (4) effective monitoring and enforcement is in place.

Bycatch in 'exemption' areas without protection measures, and in areas with incomplete protection, is causing continued population declines and population fragmentation (Davies *et al.*, 2008; DOC and MoF, 2007; Slooten and Dawson, 2010; SC/64/ProgRepNewZealand). Weak protection on the west coast of South Island, a lack of protection on the north coast of South Island and 'exemption' areas in other regions are slowing or preventing species recovery (Davies *et al.*, 2008; Slooten and Dawson, 2010). There is also continued bycatch from illegal setnetting inside protected areas.

Full details are given under item 7.2 of Annex L.

The Committee expresses particular **concern** about the low abundance of Maui's dolphins (North Island subspecies of Hector's dolphin). The latest abundance estimate of 55 individuals over one year old (CV 0.15) was calculated from a genetic mark-recapture analysis (Hamner *et al.*, 2012).

The Committee **recommends** the immediate implementation of the proposal by the New Zealand Ministry for Primary Industries to extend the North Island protected area to approximately 80km south of the latest dolphin bycatch site (Maunganui Bluff to Hawera), offshore to the 100m depth contour, including the harbours, for gillnet and trawl fisheries. This would protect part of an area with high gillnet and trawl fishing effort between the North and South Islands. Further population fragmentation could be avoided by also protecting the north coast of the South Island, providing safe 'corridors' between North and South Island populations (Hamner *et al.*, 2012).

Adequate observer coverage across all inshore trawl and gillnet fisheries is important in order to obtain robust scientific data on continuing bycatch as a means of assessing the effectiveness of protection measures.

14.7 Work plan

The Committee's views on the work plan for the sub-committee on small cetaceans are given under Item 21.

The sub-committee reviewed its schedule of priority topics which currently includes:

(1) status of ziphiids in the Southern Hemisphere; and
(2) systematics and population structure of *Tursiops*.

There is a need for extensive preparatory work for the proposed *Tursiops* review. Therefore the Committee agrees that the review of the systematics and population structure of *Tursiops* should be conducted in 2014 and an *ad hoc* group (Brownell, Perrin, Fortuna) was established to prepare for this. The Committee will need to carefully manage other agenda items to allow sufficient focus on the priority topics.

The Committee agrees that ziphiids of the Southern Hemisphere will be the priority topic at the 2013 Annual Meeting.

The sub-committee on small cetaceans convened an intersessional group evaluating the feasibility of having the so-called 'marine bushmeat' issue as a future priority topic. The group agreed on a number of attributes important for defining and delineating the issue (see Annex L). The Committee agrees to proceed with planning for a workshop characterised along the lines of 'poorly documented hunts of small cetaceans for food, bait or cash' although this may change somewhat at the discretion of the Convenor. It was emphasised that terminology and definitions as well as the scope and purpose of any workshop should be clarified in advance. A Steering Group was established under Ritter (Annex Q26).

15. WHALEWATCHING

The report of the sub-committee on whalewatching is given as Annex M. Scientific aspects of whalewatching have been discussed formally within the Committee since a Commission Resolution in 1994 (IWC, 1995c). The Commission also has a Standing Working Group on Whalewatching (IWC/64/CC6) that reports to the Conservation Committee (see Item 15.4.1).

15.1 Assess the impacts of whalewatching on cetaceans

SC/64/WW1 reviewed recent advances in whalewatching research. Steckenreuter *et al.* (2012a) investigated the impact of vessel interactions on the behaviour of a genetically distinct population of Indo-Pacific bottlenose dolphins; Steckenreuter *et al.* (2012b) examined the effectiveness of two Speed Restriction Zones (SRZs) in a dolphin-watching area; and Harris *et al.* (2012) documented interactions between cruise ships and humpback whales at Glacier Bay National Park (GBNP) in Alaska. Summaries are presented in Annex M, item 5.

SC/64/WW2 reported on a resident population of bottlenose dolphins in Bocas del Toro, Panama, of 100-150 animals. Their predictability and site fidelity has encouraged the development of several dolphin-watching operations. Resolution ADM/ARAP No. 01 (2007) regulates whalewatching activities but few operators are well-informed about the regulations and their importance. This preliminary study found that group size and group presence decrease with increasing number of dolphin-watching boats (although this trend was not statistically significant) and that overall, dolphins interacting with boats showed more avoidance behaviour. Future studies in the region will increase survey effort and include new data collection parameters to better characterise effects of dolphin-watching boats on these animals. Discussion and concerns expressed by some members of the sub-committee regarding SC/64/WW2 are detailed in Annex M, item 5.

The discussion further noted that one factor influencing the high volume of operators watching dolphins at the same time is that all operators have similar tour schedules. This results in competition among boat captains, little compliance with the regulations, and an increased risk of boat strikes (three dolphins were killed by dolphin watching boat strikes in 2011). The Committee **draws attention** to the need for developing strategies that minimise the impact of dolphin watching on the dolphin population, including staggering departure times to even out boat presence at any one time of day.

The Committee thanks the author for her presentation regarding a relevant situation in the host country and expressed concern regarding the intense and uncontrolled dolphin watching in Bocas del Toro. The Committee **strongly recommends** that Panamanian authorities enforce the relevant whalewatching regulation (ADM/ARAP No. 01) and in particular promote adherence to requirements regarding boat number and approach speed and distances. It also **welcomes** the continuation of the Cooperative Agreement between Argentina and Panama to develop and conduct operator training workshops. The Committee **recommends** continued research to monitor this dolphin population and the impacts of tourism on it.

SC/64/WW7 presented a controlled study on the swim-with-whale operations targeting humpback whales in Tonga. Up to five swimmers approached the whales while behaving in one of three ways: quietly slipping into the water and approaching at the surface making minimal noise; approaching whales at the surface making loud vigorous splashes; or, approaching whales with surface swimming and subsurface diving. The control treatment involved the boat approaching whales with no swimmers entering the water. The measure of disturbance was the time until the whales moved from their original location. Preliminary analyses suggest there was no significant difference between the quiet approach and the control, whereas there was a significantly shorter time to departure when the swimmers were loud and splashing, suggesting the management of swimmer behaviour could reduce the disturbance. Discussion is detailed in Annex M, item 5.

SC/64/WW3 presented a modelling approach to examine the potential effects of dolphin watching. Health was used to link individual behavioural changes to vital rates, since health can moderate survival and reproduction. Behaviours had a cost-benefit relationship with dolphin motivations (e.g. foraging reduces hunger), and health was linked to hunger to avoid biologically unrealistic variation. Trade-offs between motivations (e.g. hunger versus fear) then determines behaviour. Application to a bottlenose dolphin population in New Zealand found increased time foraging and decreased time resting leading to a negative shift in the population's health. A theoretical, larger population was then considered, looking at the potential loss of foraging time due to whalewatching vessels. Population-level impacts were dependent on population size and the intensity of whalewatching activities: larger populations required greater disturbance intensity to realise a population-level effect. These results highlight the need to consider whalewatching impacts and management at the population level. Short-term changes in behaviour can be significant, but do not automatically indicate a threat to the population's long-term health. Discussion and concerns over some aspects of SC/64/WW3 are detailed in Annex M, item 5.

The Committee **welcomes** the use of modelling to address the effects of whalewatching on cetaceans. It was suggested that Bocas del Toro, Panama, might be a location where this model could be tested.

15.2 Review whalewatching off Central America

SC/64/SH16 reported on whalewatching operations used as platforms of opportunity in Costa Rica, mainly offering trips to Marino Ballena National Park and Isla del Caño Biological Reserve, areas used by humpback whales during the winter. It was noted that this is a location where, without action, whalewatching could expand without sufficient oversight or control. It was suggested that this could be an important location for future focused work to assess the development and evaluation of regulations, monitoring efficacy and compliance. The Committee **expresses concern** that whalewatching operators appear to target mothers and calves, especially as the season progresses.

A survey investigating whalewatching tourists' attitudes toward cetacean conservation issues was undertaken in Blackbird Caye, Turneffe Atoll, Belize in 2007 and 2008

(Patterson, 2011), an area that provides year-round habitat to approximately 200 coastal bottlenose dolphins. Two main types of whalewatching were identified: dedicated cetacean research and incidental cetacean watching. Information relevant to the Committee is detailed in Annex M, item 6.

Annex M, Appendix 2 presents information summarising the known whalewatching operators, areas and targeted species in Central America. All Central American countries have whalewatching activities, primarily concentrated in the Pacific, but only Costa Rica and Panama have organised their industries with tour operator associations. In the south Pacific coast of Costa Rica, workshops to train and certify operators in best practices are being held twice a year. In Panama, operator training started in 2006 and will continue this year. In Guatemala and Nicaragua, whalewatching operators are becoming organised. Belize, Honduras, and El Salvador do not yet have organised whalewatching operators or associations or whalewatching regulations.

The Committee **welcomes** the information provided in Annex M, Appendix 2. It was noted that more whalewatching may be occurring in the region, but it is likely to be incidental or opportunistic.

15.3 Reports from intersessional working groups

15.3.1 Large-scale whalewatching experiment (LaWE) Steering Group

The Convenor for this intersessional correspondence group was unable to attend this year's meeting. A detailed progress report of this group's intersessional work is provided in the appendix of SC/64/WW6.

SC/64/WW6 introduced a meta-analysis to test for significant changes in speed, activity budget, inter-breath intervals and cetaceans' paths during whalewatching events. These changes could lead to increased energy expenditure and reduced foraging. In a call for participants, 10 ultimately provided data, after accounting for quality assurance and control procedures. A random effects model allowed for incorporation of heterogeneity due to moderators, such as study quality and body size. Only presence versus absence of vessels was modelled due to data limitations. Whalewatching activities had an impact in all studies, although the magnitude of the response varied. The only consistent response across species was path linearity and changes in resting behaviour. The only significant moderator was the effect of body size: smaller species and populations were less likely to rest in whalewatching vessels' presence. Researchers were receptive to suggested protocols meant to improve the quality of data collected.

15.3.2 LaWE budget development group

This intersessional group was unable to make progress. The Convenor sought information on budget requirements from the LaWE principals, but did not receive sufficient information to develop a budgetary framework. The Committee **strongly recommends** that the principal researchers on the LaWE Steering Group provide concrete information on budget requirements to the Convenor of the budget development intersessional group well before the next Annual Meeting, to allow this group's work to progress.

15.3.3 Online database for worldwide tracking of commercial whalewatching and associated data collection

Work continued intersessionally to develop a database to keep track of the details of whalewatching operations worldwide. The database developer is working towards putting the current version on the Commission's server for evaluation by the Committee.

15.3.4 Swim-with-whale operations

The questionnaire for operators (Rose *et al.*, 2007) was field-tested on three companies in the Dominican Republic in early 2012. Their responses indicated that the questionnaire was appropriate and sufficient to present more widely to operators. Further work will be undertaken intersessionally to distribute the questionnaire to more operators. The Committee thanks Rachel Ford, who conducted the field test of the questionnaire and the Pacific Whale Foundation which funded Ford's trip to the Dominican Republic.

15.3.5 In-water interactions

The Committee discussed the issue of human-cetacean in-water interactions in the wild in 2011 and an intersessional correspondence group was established (see IWC, 2012s). In order to examine potential risks to both cetaceans *and* humans, key points will be to identify for whom these in-water interactions are dangerous and what is considered dangerous. Definitions are elaborated in Annex M, item 7. In its work plan, the group proposes to work on a comprehensive list of human-cetacean in-water interactions, based on Scheer (2010), and to elaborate a list of areas and operations where in-water interactions take place.

In discussion, the Committee noted that the Commission's Five Year Strategic Plan for Whalewatching (see Item 15.4.1) may not adequately account for swim-with-whale and in-water interactions as forms of whalewatching. The Committee **recommends** that the Commission address issues that arise uniquely from operations that allow customers to swim with or feed cetaceans. It was suggested that the Commission refer to the Committee's definitions of types of whalewatching, as reported in Parsons *et al.* (2006), as well as the General Guidelines[27] as it progresses its work on whalewatching.

15.4 Other issues

15.4.1 Review scientific aspects of the Commission's Five Year Strategic Plan for Whalewatching

The Committee **agrees** that the goal of its review was to offer the Commission advice that will lead to results that benefit both the work of the Conservation Committee's SWG on whalewatching as well as the Scientific Committee's work. It was clarified that while the Committee focused its input on Objectives 1 (Research) and 2 (Assessment), all five objectives of the Strategic Plan could benefit from further cooperation between the two Committees, particularly in regards to elements such as regulatory frameworks, where this Committee could contribute expertise, data, and other work.

The Committee again recognises the ambitious scale of the science-related work programme found in the Strategic Plan and noted that the Commission should consider which actions would require additional time to address (see Annex M, Appendix 3). A Working Group was convened to formulate the Committee's comments back to the Commission. The Committee **endorses** the results of their consultation, which can be found in Annex M, Appendix 3.

An intersessional correspondence group (see Annex Q29) was established to discuss and develop guiding principles per Action 1.1 in the Strategic Plan. Action 1.2 should be completed intersessionally, with results reported to the next meeting.

[27] *http://www.iwcoffice.org/conservation/wwguidelines.htm.*

15.4.2 Consider information from platforms of opportunity of potential value to the Scientific Committee

The United Nations Environment Programme-Caribbean Environment Programme (UNEP-CEP), through the Specially Protected Areas and Wildlife Protocol and with the support of the National Environmental Authority of the Government of the Republic of Panama, convened a regional Workshop on marine mammal watching on 19-22 October 2011 in Panama City, Panama (Anon., 2011), bringing together marine mammal tour operators and government regulators from across the wider Caribbean region (WCR). The participants concluded that the data collected during marine mammal watching operations have the potential to answer questions about marine mammal populations in the WCR. Furthermore, these data should involve a network of collectors that cover larger field areas and should be archived so that they can be accessed and facilitate collaborations. Acknowledging the importance of standardised data, a template data form was developed. A copy of the proposed data form for the WCR may be found in Appendix V of the Workshop report.

The Committee **welcomes** this report on UNEP-CEP's activities and encouraged the submission of work related to this initiative to future meetings (and see Item 15.4.3)

Sollfrank and Ritter (2012) presented results from a study conducted on La Gomera (Canary Islands). Boat-based studies have been ongoing for several years, but little effort has been made to observe cetaceans systematically from land. This study demonstrated that it is possible to direct whalewatching boats to cetaceans spotted from land, allowing comprehensive and simultaneous data collection from land-based stations and boat-based platforms of opportunity. Land-based observations are the best way to monitor compliance with whalewatching regulations and to measure impacts from whalewatching vessels, as the presence of a research vessel does not influence operators or confound impact results.

M.E.E.R. (2012) laid out a model for a marine protected area (MPA) for sustainable whalewatching in the Canary Islands. Almost 15 years of cetacean data collected exclusively on whalewatching vessels (platforms of opportunity) were used to elaborate a marine protected area model. With anthropogenic threats increasing, the MPA model is especially designed for long-term development of whalewatching and other uses in a sustainable way. It is hoped that this report will contribute to the process of designating effectively managed marine protected areas within the European Union and elsewhere.

The Committee **welcomes** this presentation, as it represents the type of data most relevant to this agenda item and the work of the Committee as it can be applied toward science-based management decisions and actions.

SC/64/O12 reported on the situation in Samaná Bay, Dominican Republic, part of a national marine mammal sanctuary (along with the Navidad and Silver Banks). The Samaná Bay Boat Owners Association provides space aboard whalewatching vessels as platforms of opportunity. Data obtained over a period of 12 years were analysed to determine the spatial and temporal distribution of humpback whales in Samaná Bay. This information has played a vital role in the marine spatial planning of Samaná Bay and the creation of a conservation zone with restricted fisheries and tourism activities during the whale calving season. Details on the results of the study and discussion are found in Annex M, item 8.2

In particular given the expanding development of tourism in Samaná Bay, the Committee **recommends** that monitoring and research continue, especially in light of the increasing number of cruise ships entering the bay during the calving season.

SC/64/SH16 reported that along the South Pacific coast of Costa Rica, whalewatching boats have been used as platforms of opportunity to collect data on distribution and behaviour of humpback whales from breeding stock G from 2009-11. The results indicated a high number of mother-calf pairs and the use of coastal waters as a breeding ground. It was suggested that this location might be a good place to study the efficacy of an MPA by conducting research on the behaviour of animals inside and outside the MPA.

15.4.3 Review whalewatching guidelines and regulations

Carlson noted that the compendium of regulations and guidelines[28] on the Commission website was open, as always, to additions and updates. The Committee thanks Carlson for her committed work in this regard and **agrees** that the compendium is a valuable tool and should be continued. SC/64/WW5 analysed the compendium. The analyses, like the compendium, are intended as a reference, in this case to demonstrate both the diversity and similarities in existing rules. The Committee **agrees** that this analysis would also be a useful reference for the Commission and **recommends** that it also be posted on the Commission website.

The Committee reviewed the General Principles[29] and considers them robust. However, it **recommends** that they be renamed 'General Guidelines' (to avoid confusion with the term 'guiding principles'). It **agrees** to revisit them on a more regular basis to ensure they remain representative of 'best practices' and to address them under the standing agenda item on reviewing whalewatching guidelines and regulations.

SC/64/WW1 reviewed several studies that addressed whalewatching guidelines and regulations: Howes *et al.* (2012) investigated the effectiveness of the Ticonderoga Bay Sanctuary Zone to mitigate pressures of dolphin-swim operations on a small population of bottlenose dolphins; Alves *et al.* (2011) report on tourists swimming with and feeding Amazon river dolphins in Brazil; Ponnampalam (2011) collected baseline data on the nature of whalewatching in the Sultanate of Oman; and Pacheco *et al.* (2011) describe the success rate of sighting humpback whales from a marine wildlife-watching vessel operating in the coastal waters off northern Peru. Summaries are found in Annex M, item 8.3.

A product of the regional Workshop on marine mammal watching held in Panama (Anon., 2011) was the development of overarching principles and best practice guidelines for marine mammal watching in the WCR (UNEP-CEP, 2011a; 2011b). These principles and guidelines take into consideration pre-existing codes of conduct and regulations from countries within, and outside, the WCR and closely follow the steps and language used in the document *Pacific Islands Regional Guidelines for Whale and Dolphin Watching* (IFAW, 2008). All of the principles and guidelines developed for the WCR were agreed upon by the tour operators and regulators present at the Workshop and may serve as the basis upon which each country's own codes of conduct and regulations may be developed.

Galletti reported that the Chilean Government enacted whalewatching regulations in 2012. Many of the

[28]*http://www.iwcoffice.org/conservation/whalewatching.htm#regulations.*
[29]*http://www.iwcoffice.org/conservation/wwguidelines.htm.*

recommendations made by the Scientific Committee in 2007 were included, such as a maximum 300m approach distance for blue whales and allowing only land-based whalewatching for critically endangered southern right whales. Regulations will be translated into English and submitted for the compendium. The Committee **welcomes** this news.

15.4.4 Review of collision risks to cetaceans from whale-watching vessels

No new information was presented under this item.

15.4.5 Swim-with-whales operations

SC/64/WW1 presented information on swim-with programmes: Mangott *et al.* (2011) reported on swim-with dwarf minke whales on the Great Barrier Reef. The summary is found in Annex M, item 8.5. The Committee **reiterates its recommendation** from Item 15.3.5.

15.4.6 Emerging whalewatching industry in Oman

Oman's whalewatching industry has experienced gradual growth over the last 10 years, reflecting a steady increase in tourism and a growing awareness of cetacean fauna. The Arabian Sea humpback whale has recently become a target of opportunistic and unregulated whalewatching in southern Oman. The Committee has previously expressed concern over the status of this population which is discussed further under Item 10.7; unregulated whalewatching represents an additional potential threat to this population.

Existing, unofficial whalewatching guidelines in Oman are now over 10 years old. Progress has been made on updating these guidelines as well as gathering data on whalewatching operations, but further technical support is required to finalise the new guidelines as well as to assist with the training of operators.

The Committee **strongly recommends** that operator training workshops should be conducted with a view to promoting best practice for whalewatching and to aid the interpretation and implementation of revised whalewatching guidelines (see also Item 21).

15.5 Work plan

This is discussed under Item 21.

15.6 Other matters

It was noted that the development of general data requirements on the effects of whalewatching would be valuable in situations where a country is considering whether it would be sustainable to increase the level of whalewatching (e.g. a proposed increase in whalewatching permits for Kaikoura, New Zealand). The concept of assessing 'whalewatching carrying capacity' is of interest in the management and scientific communities and the Committee **encourages** presentation of a paper outlining the situation in New Zealand at the next meeting of the Committee to facilitate its discussions of the broader issue.

16. DNA TESTING

The report of the Working Group on DNA is given as Annex N. This particular agenda item has been considered since 2000 in response to a Commission Resolution (IWC, 2000).

16.1 Review genetic methods for species, stock and individual identification

No documents were presented this year. The Committee encourages the preparation of technical documents on methods for species, stock and identification for discussion at the next year meeting (see also Item 16.5).

16.2 Review results of the amendments of sequences deposited in GenBank

During the first round of sequence assessment (IWC, 2009h, p.347) some inconsistencies were found that appeared to be due to a lag in the taxonomy recognised by *GenBank* or uncertainty in taxonomic distinctions currently under investigation: 23 labelled as *Balaenoptera acutorostrata* in *GenBank* were identified as *B. bonaerensis*, 9 labeled as *B. edeni*, and 10 labeled as *Eubalaena glacialis* were identified as *E. australis* and *E. japonica*. The Committee had recommended notifying the original submitter about the inconsistency and encouraging an amendment to be made to the entry.

Following 2010/11 intersessional work, amendments were made for four cases of Bryde's whale and one case of minke whale, respectively (IWC, 2012f, p.52). In view of the limited responses, the Committee had requested that an official letter be sent from the Secretariat requesting the submitters to make the amendments in *GenBank*. This was done for three scientists for which addresses were available, involving nine cases of right whale (one scientist), one case of right whale (one scientist) and one case of Bryde's whale (one scientist). Unfortunately no responses have yet been received and thus no amendments have been made in *GenBank* during the intersessional period.

In view of this, for the next period, the Committee **reiterates** its previous suggestion on the addition of a field in *GenBank* where comments on taxonomy updates of the entries can be made (IWC, 2012f; p.52). The Committee **agrees** that Cipriano should make a request to *GenBank* and that he should inform the IWC Secretariat and the Convenor of the DNA Testing Group if a more formal request is required.

16.3 Collection and archiving of tissue samples from catches and bycatches

Last year, the Committee endorsed a new format for the updates of national DNA registers to assist with the review of such updates (IWC, 2012f, p.53). The updates of the DNA registers by Japan, Norway and Iceland this year were based on this new format.

The collection of tissue samples in Japan is from special permit whaling in the North Pacific (JARPN-JARPN II) and Antarctic (JARPA-JARPA II), and from bycatches. It includes coverage for 1994-2011 (JARPN-JARPN II), 1987/88-2011/12 (JARPA-JARPA II). In the case of bycatches it includes coverage for 2001-11 (see Annex N, Appendix 2).

The collection of tissue samples in Norway is from the commercial catches of North Atlantic common minke whales. It includes coverage for the period 1994 to 2011 (see Annex N, Appendix 3).

The collection of tissue samples in Iceland is from scientific whaling and from commercial catches. It includes coverage for 2003-07 (permit whaling) and 2006-11 (commercial whaling) (see Annex N, Appendix 4).

16.4 Reference databases and standards for diagnostic registries

In the Japanese register, almost all common minke whale sampled by JARPN-JARPN II in 1994-2011 were screened for mtDNA and microsatellites. Almost all minke whales bycaught in 2001-10 were screened for mtDNA and microsatellites. For animals bycaught in 2011, the percentage for microsatellite is lower (77.8%). This lower percentage is a result of the loss of 26 samples after the 2011 tsunami in Japan (see Annex N, Appendix 2).

Almost all Bryde's whales sampled by JARPN II in 2000-11 were screened for mtDNA and microsatellites. Genetic work for mtDNA and microsatellite was completed for four whales bycaught in 2001-10. Almost all sei whales sampled by JARPN II in 2002-11 were screened for mtDNA and microsatellites (see Annex N, Appendix 2).

Almost all sperm whales sampled by JARPN II in 2000-10 were screened for mtDNA and microsatellites. The single animal sampled in 2011 was screened for mtDNA. Microsatellite work has not been completed yet. All sperm whales bycaught in 2001-10 were screened for mtDNA and microsatellites (see Annex N, Appendix 2).

In the case of Antarctic minke whales, 16.5% and 92.3% of the whales sampled by JARPA in 1987/88-2004/05 were screened for mtDNA and microsatellites, respectively. Work for mtDNA is ongoing. Many of the samples of JARPA II (2005/06-2010/11) were lost after the 2011 tsunami in Japan. DNA work is ongoing on the recovered samples. For animals sampled in 2011/12, the mtDNA and microsatellite work has not yet been completed. For Antarctic fin whales, the 17 samples collected by JARPA II in 2005/06-2010/11 were screened for mtDNA and microsatellites. The DNA work on the single animal sampled in 2011/12 is ongoing (see Annex N, Appendix 2).

All North Pacific humpback whales bycaught in 2001-11 were screened for mtDNA and microsatellites. Two North Pacific right whales and three North Pacific fin whales bycaught from 2001-10 were screened for both mtDNA and microsatellites (see Annex N, Appendix 2).

Almost all samples in the Japanese DNA registry have been sexed (see Annex N, Appendix 2).

A suggestion was made that the genetic data of bycaught humpback whales could be of use for testing hypotheses on stock structure of this species in the western North Pacific.

In the Norwegian register, after discounting for duplicates, missing samples and laboratory problems, 100% of the North Atlantic common minke whale caught in 1997-2011 were screened for mtDNA and microsatellite (see Annex N, Appendix 3). The Committee **commends** the analyses on quality control carried out on the Norwegian DNA register (Glover *et al.*, 2011).

In the Icelandic registry, all common minke whales sampled under scientific permit whaling in 2003-07 were screened for mtDNA and microsatellites. The percentage for both markers is 6.1% for whales taken by commercial whaling in 2007-10. The percentage is 3.5% for whales taken by commercial whaling in 2011. All fin whales caught by commercial whaling in 2006-10 were screened for both mtDNA and microsatellites (see Annex N, Appendix 4). A question was raised on the low percentage for the commercial samples of common minke whale. In response, Víkingsson noted that while not required by IWC rules or regulations, tissue samples had been collected for the DNA register from all animals caught in the Icelandic commercial hunt. The delay in the laboratory analyses of samples collected since 2007 is due to funding restrictions but these will be completed before the *Implementation Review* of North Atlantic common minke whales scheduled for 2014.

The Committee appreciates the efforts of Japan, Norway and Iceland in compiling and providing detailed information on their registries in the new format. The Committee **agrees** that the information provided in the new format greatly facilitated the annual review.

16.5 Work plan

The Committee **encourages** the submission of papers in response to requirements placed on the Committee by IWC Resolution 1999-8 (IWC, 2000). Relevant information in documents submitted to other groups and sub-committees of the Committee will be reviewed next year. Results of the 'amendments' work on sequences deposited in *GenBank* will be reported next year.

17. SCIENTIFIC PERMITS

This Agenda Item was discussed by the Working Group on Special Permits in two late afternoon sessions to enable all Committee members who wished so to attend. Bjørge was elected Chair of the Working Group. Weller acted as Rapporteur, and the Working Group report has been directly incorporated here.

17.1 Review of results from existing permits

As in previous years, the Committee received short cruise reports on activities undertaken but spent relatively little time on discussion of the details. For long-term programmes the Committee has agreed that regular periodic detailed reviews (following 'Annex P') were more appropriate.

17.1.1 JARPN II

17.1.1.1 AUTHORS' SUMMARIES

SC/64/O3 presented the results of the 2011 Japanese Whale Research Program under Special Permit in the Western North Pacific - Second Phase (JARPN II) offshore component survey in sub-areas 7, 8 and 9 of the western North Pacific. There were three main research components: the whale sampling survey; the dedicated sighting survey; and the whale prey species survey. Two sighting/sampling vessels (SSVs), one research base vessel (NM whale sampling survey component), one whale prey survey vessel equipped with scientific echo sounder (PSV) and three dedicated sighting vessels (SVs) were used. The whale sampling survey took place from 11 June to 5 September 2011. A total of 5,156 n.miles was surveyed in 76 days (by the SSVs and NM) sightings included, 53 common minke, 476 sei, 149 Bryde's, 295 sperm, 66 fin and eight blue whales. A total of 49 common minke, 95 sei, 50 Bryde's and one sperm whale were sampled by the SSVs. Sampled whales were examined on board the research base vessel. In July, common minke whales fed mainly on Japanese anchovy near Syiriya and they fed mainly on walleye pollock around the east of Hokkaido. There were geographical changes of prey species of minke whales in sub area 7. Sei whales fed mainly on copepods and Japanese anchovy from June to August in sub areas 8 and 9. Bryde's whales fed mainly on krill in sub area 7 in July. Dominant prey species in the stomach of the sperm whale included mid- and deep-water squid. The dedicated sighting surveys took place from 28 April to 6 June 2011 in sub areas 8 and 9. During 4,060 n.miles surveyed three common minke, 51 sei, six Bryde's, 116 sperm, 31 fin and four blue whales were sighted. The prey species survey was carried out from 13 to 28 June in 2011. In parts of sub areas 8 and 9 by the PSV. Its objective was to estimate sei whale habitat and prey preference in relation to oceanographic and prey environments as well as productivity in early summer. Data obtained in this research will be used to elucidate the role of whales in the marine ecosystem through the study of whale feeding ecology in the western North Pacific.

SC/64/O4 presented the results of the 2011 JARPN II - coastal component - survey in spring. Usually the coastal spring survey is carried out in the locality of Ayukawa. On March 11 2011 the Ayukawa town, including all research facilities of JARPN II there, was destroyed by a large earthquake and tsunami. For this reason, the 2011 spring coastal survey was conducted in Kushiro, from 25 April to 10 June, using three vessels. Sampling occurred within 50 n.miles from Kushiro port, and animals were landed at the JARPN II research station. A total of 3,867.4 n.miles was surveyed and 36 schools (43 individuals) of common minke whales were seen and 17 common minke whales were sampled. Average body length was 6.70m (SD=0.84, n=9) for males and 6.29m (SD=1.02, n=8) for females. Dominant forestomach prey species were walleye pollock (*Theragra chalcogramma*) throughout all of the survey period, and krill (*Euphausia pacifica*) which was observed less frequently. Walleye pollock is one of the most important food items for common minke whales in Kushiro in both spring and autumn seasons. Distribution of common minke whales appears to differ between spring and autumn surveys in Kushiro, at least for some years.

SC/64/O5 outlined the results of the autumn survey of the JARPN II coastal component off Kushiro, northeast Japan (the sub-area 7CN) in 2011. The survey was conducted from 9 September to 30 October 2011, using four vessels. During 5,367.8 n.miles searched, 144 schools and 150 individual common minke whales were sighted and 60 whales were sampled. Average body length was 6.24m (SD=1.06, n=35) for males and 6.05m (SD=1.08, n=25) for females. Overall, 19 of the 35 males (54.3%) and three of the 25 females (12.0%) were sexually mature. The dominant forestomach prey species was Japanese anchovy (*Engraulis japonicas*) (61.7%), followed by walleye pollock (26.7%), and krill (8.3%). Pacific saury (*Cololabis saira*) and Japanese common squid (*Todarodes pacificus*) were not observed. The frequent sightings of whales in combination with the slightly higher ratio of mature and larger whales in the 2011 survey, as compared to the 2010 survey, as well as more whales comsuming Japanese anchovy suggested that the abundance and distribution of this prey item may have attracted whales to the coastal waters off Kushiro in autumn 2011. During the survey, no apparent impact due to the earthquake in March 2011 was detected in the distribution, density or catch composition of common minke whales. This implied that effect of the earthquake on the migration of common minke whales in the coastal waters off Kushiro might be negligible.

17.1.1.2 DISCUSSION

Following the cruise report presentations, there was some discussion of how the cruise tracks for the coastal survey off Kushiro were designed and if the intent was to obtain a representative sample or rather to increase the probability of encountering whales. The authors of SC/64/O5 explained that survey vessels used during the coastal component of the programme departed port each day following a number of predetermined lines with 15° radials that were selected on a daily basis after review of weather, oceanographic conditions and the distribution of whales. Survey tracks were concentrated relative to whale distribution and differed from standard line transect methods in that the first 30 n.miles were dedicated to survey search mode followed then by the vessels moving freely within the study area.

In further discussion, the Working Group was reminded that at last years meeting it was suggested that whales taken during coastal operations be examined for radionuclides, especially caesium-137, for use in stock elucidation (IWC, 2012f). The authors of SC/64/O4 stated that one of the three objectives of the JARPN II programme was to monitor environmental pollutants in cetaceans and the marine ecosystem. Data collection for radionuclide assessment is being undertaken and data are available on the website of the Fisheries Agency of Japan.

17.1.2 JARPA II

17.1.2.1 AUTHORS' SUMMARY

SC/64/O2 presented the results of the 2011/12 survey of the Second Phase of the Japanese Whale Research Program under the Special Permit in the Antarctic (JARPA II). Two dedicated sighting vessels (SV), one sighting and sampling vessel (SSV) and one research base vessel engaged in the research for 66 days, from 1 January to 6 March 2012 in Areas V (130°E-170°W) and VI West (VIW: 170°W-145°W). Unfortunately, the research activities were interrupted several times by the violent sabotage activities of an anti-whaling group. The planned dedicated sighting survey had to be cancelled so that the vessels could undertake security tasks. The research activity of the SSV was also interrupted several times. The total search distance by the SSV of 3,040.5 n.miles, was approximately one-third of the search distance in 'normal' years. Eight species including six baleen whales (blue, fin, sei, Antarctic minke, humpback and southern right whale) and two toothed whales (sperm and southern bottlenose whales) were seen. The most common species seen (284 schools, 684 individuals) was the Antarctic minke whale followed by the humpback (112 schools, 208 individuals) and fin whales (11 schools, 31 individuals). A total of 266 Antarctic minke whales (99 males and 167 females) and one fin whale (female) were sampled examined on the research base vessel. A total of five blue, six humpback and four southern right whales were photo-identified. Two biopsy samples were collected from humpback whales and four from southern right whales. In March, satellite tags were deployed on two southern right whales. Oceanographic surveys to investigate vertical sea temperature profiles were also implemented using XCTD. In summary:

(1) whale composition in the research area was stable compared to previous JARPA and JARPA II surveys in the same area;
(2) the ice-free extent in Area VIW was substantially larger than in previous seasons;
(3) high density areas of Antarctic minke whales were observed near the ice edge;
(4) mature female Antarctic minke whales were dominant in the southern part of Area VIW (66.8%); and
(5) Antarctic minke whales in the 'transition area between 130°E and 165°E (area of stocks mixing), were successfully sampled.

17.1.2.2 DISCUSSION

Following the presentation of the 2011/12 JARPA II cruise report, it was noted that the lack of discussion did not imply there is agreement on the issue of scientific whaling under special permits. Differing views on this activity remain and the Working Group was referred to the statements made in Annex P1 and Annex P2.

17.1.3 Planning for a final review of results from Iceland - North Atlantic common minke whale

The results from the Icelandic programme on common minke whales will be subject to final review during the coming intersessional period. 'Annex P' (IWC, 2009i) documents the review process. The only time this procedure has been used was to review the JARPN II Special Permit in 2009 (IWC, 2010b). While the process worked well in general (IWC, 2010d), improvements on some aspects of the implementation of the process have been agreed and are detailed in Annex P4 of last year's report (IWC, 2012t). One change in implementing the 'Annex P' procedure (IWC, 2009i) will be the presence of observers. The general outline of the Workshop includes an initial session where a restricted number of scientists associated with the proposal will present results of their research and answer questions. Then the main part of the review Workshop will be closed sessions where the expert panel evaluates the results. At the end of the Workshop there will be a short open session where the expert panel can ask scientists associated with the proposal questions for clarification. Observers will be allowed to the open sessions. In light of these modifications, the timetable to be used for the Iceland and JARPA II reviews is presented in Table 3 of Annex P4 (IWC, 2012t).

Víkingsson stated that Iceland will meet the requirements of the time schedule of Annex P4 (IWC, 2012t) for a review in 2013. The Working Group **agrees** that the review of results from Iceland will occur in February/March 2013.

SC/64/SCP1 addressed the data availability under Procedure B of the Data Availability Agreement. A small group was set up to consider this document. The Committee **agrees** the clarifications to 'Annex P' (IWC, 2009i) included as Annex P3.

17.1.4 Planning for a periodic review of results from JARPA II

The Working Group **agrees** that the review of results from JARPA II will occur in February/March 2014.

17.2 Review of new or continuing proposals

17.2.1 JARPA II

Japan reported that there was no plan to change the JARPA II programme.

17.2.2 JARPN II

Japan reported that there was no plan to change the JARPN II programme.

18. WHALE SANCTUARIES

The Committee received no new proposals for sanctuaries this year. The report of an international Workshop on Marine Protected Areas (SC/64/O20) was discussed in Annexes K and M.

19. SOUTHERN OCEAN RESEARCH PARTNERSHIP (SORP)

The Southern Ocean Research Partnership (SORP) was proposed by the Australian Government to the IWC in 2008 (IWC, 2008b) with the aim of developing a multi-lateral, non-lethal scientific research programme to improve the coordinated and cooperative delivery of relevant scientific information to the IWC. The Partnership now includes ten countries: Argentina, Australia, Brazil, Chile, France, Germany, New Zealand, Norway, South Africa, and the USA. A framework and set of objectives for SORP have been endorsed by the Committee (IWC, 2011f) and six SORP research projects were endorsed last year (IWC, 2012f). Progress of these research projects was reviewed this year. The IWC has a budget specifically related to the work of SORP established with a contribution from Australia in 2008 and supplemented by additional voluntary contributions from Australia and the USA in 2011. This budget is administered by the IWC Secretariat.

SORP was originally discussed in an open session, chaired by Gales and rapporteured by Bell. The report of that session is incorporated directly into the Plenary report here.

The Committee noted that in April 2012, Bell was appointed the Southern Ocean Research Partnership coordinator replacing Childerhouse and Wadley was appointed the Antarctic Blue Whale Project coordinator.

19.1 Review of progress since IWC/63

SC/64/O13 summarised the progress of SORP since IWC/63. Progress was made on the following major items.

(1) *Overall support and progress of the six SORP research projects* – progress reports for the 2011/12 period are available in SC/64/O13.
(2) *Provision of interim funding* – funding was provided for all six SORP projects to support research during 2011/12 (IWC, 2011f).
(3) *Further development of the* SORP Antarctic Blue Whale Project *(formerly known as the SORP Year of the Whale Project)*.
(4) *Planning and implementation of collaborative SORP Antarctic blue whale expeditions* – two expeditions led by Australia were undertaken in the austral summer of 2011/12 (SC/64/SH11) to develop and test methodologies that will be employed during the SORP Antarctic Blue Whale Voyage planned for early 2013 (SC/64/SH13). Further development of acoustic methods (SC/64/SH12) and survey design (SC/64/SH10, SH14, SH26) was also undertaken.
(5) *Completion of the core SORP project*: the Living Whales Symposium and Workshops, held in Chile in March 2012 (SC/64/O14).

These items are covered in more detail below. The Committee was **pleased** to note that SORP is being successfully implemented and **welcomes** the results.

19.1.1 SORP Antarctic Blue Whale Project

The title 'Antarctic Blue Whale Project' (ABWP) now replaces 'The Year of the Whale' (YOTW) to reflect the fact that the proposed research will require a multi-year, multi-platform, integrated and coordinated research effort. This became clear following discussions within the Committee and intersessionally, particularly given the extensive methodological development (IWC, 2012m; Kelly *et al.*, 2011; SC/64/SH10-14, SC/64/SH26) reported. A single season effort is not an appropriate strategy to deliver an estimate of circumpolar abundance, given logistical constraints and the preferred sampling regime under a mark-recapture approach.

The specific objectives of this initiative are to:

(1) provide a circumpolar abundance estimate for Antarctic blue whales;
(2) improve understanding of Antarctic blue whale population structure;
(3) improve understanding of connectivity between blue whale feeding and breeding grounds; and
(4) characterise foraging habitat of blue whales.

SC/64/O13, SC/64/SH10-14 and SC/64/SH26 were discussed in Annex H. The project was very well received as an investigation to determine the viability of ideas and methods. Gales welcomed the maturing ideas and methods under development and their implementation in the Southern Ocean during 2012/13. Results from the ABWP have been presented at international scientific meetings, including the International Polar Year conference in Montreal, April 2012.

The importance of SORP as a means to engender international cooperation was noted. There are encouraging signs that estimating the circumpolar abundance of blue whales will be possible.

19.1.2 Ways to expand Antarctic Blue Whale Project (ABWP) work

SC/64/O16 provided information about the South African Blue Whale Project (SABWP) and it was discussed in Annex H. Despite evidence of recent increase, the population of Antarctic blue whales remains severely depleted from commercial whaling. Both the high concentrations of sightings of Antarctic blue whales in the 0-20°E sector of the Antarctic in recent years (IDCR/SOWER sighting records) and the high historic catches of some 12,000 probable Antarctic blue whales off the west coast of South Africa, Namibia and Angola prior to 1930, suggest that the southeastern Atlantic Ocean and neighbouring Southern Ocean region should provide exciting opportunities for research on Antarctic blue whales. The South African Blue Whale Project (SABWP) has been recently funded by the South African National Antarctic Programme (SANAP) and the National Research Foundation (NRF) to investigate the seasonality, distribution and relative abundance of this species in these areas with the long-term aim of determining relative abundance indices to measure the population trend. Research efforts will be concentrated in two regions; 67°S to the ice edge and 0-20°E region in summer, and off the south-western Cape coast in winter. Autonomous Acoustic Recorders (AARs) will be deployed in both the high and low latitude regions to determine distribution and seasonality patterns of this migratory species. Line-transect surveys (incorporating photo-ID, biopsy sampling and ship-based passive acoustic monitoring) will be carried out in the Antarctic region during summer to provide abundance and call-rate measurements for 'broadbrush' ground-truthing of Antarctic AAR data. Low-latitude AAR data will provide information on where and when to concentrate future research efforts off the southwestern Cape coast. Data from this voyage will contribute to the ABWP and other SORP projects. A proposal for one of the team to receive training in AAR deployment during a cruise off Greenland this summer (SC/64/O17) has been adopted.

Norway joined SORP two years ago. Norway may contribute to SORP in the following manner.

(1) Financially: upon provision and favourable review of a budget and research proposal from existing or new SORP projects, Norway would be willing to fund research. Norway does not have to be involved in the research proposal.
(2) In kind support: annually, Norway sends scientists on fishing vessels that work in the Southern Ocean, in 2012/13 primarily around the South Orkney Islands. Biannually, the Norwegian vessel R/V *G O Sars* operates in the Southern Ocean I.A. in the area around Bouvet Island. This is a dedicated research vessel that can be directed to other areas. It will next sail in 2013/14 (to be confirmed). Berths on these vessels could be made available to SORP researchers.
(3) Personnel: the expertise of Norwegian scientists could be provided for collaboration on SORP research projects.

Particular interest was expressed in contributing to the Antarctic Blue Whale Project. The Committee **greatly welcomes** Norway's offer of monetary, in kind and personnel support for SORP and **agrees** that it will be resolved intersessionally how it will be managed and administered.

The Committee was informed of France's intention to use the R/V *l'Astrolabe* to carry out a photo-ID and sightings surveys of blue whales in Terre Adelié. Surveys will be carried out over the next two years and it is hoped it can be continued for up to four years. A marine science voyage is also being considered in the southern Indian Ocean, south of Kerguelen on the Marion Dufresne. It is hoped that time may be allocated on this to perform blue whale research but it is a highly competitive process.

The Committee was informed of Germany's intention to perform its fifth cetacean survey from January to mid-March 2013 in the western Weddell Sea. This will be a repeat of the 2006/07 survey. The aim is to relate krill abundance to hydrography and oceanography. Helicopters will be used as the survey platform.

The Committee was also informed of plans by the International Fund for Animal Welfare for a Southern Ocean voyage that may be able to contribute to the Antarctic Blue Whale Project through combined acoustic surveys and photo-ID.

It was noted that collaboration with the wider Antarctic community is underway with SCAR, COMNAP, IAATO and CCAMLR to pursue the objectives of the ABWP.

The Committee **encourages** international involvement in the SORP Antarctic Blue Whale Project in the form of research, ship time or personnel. The Committee also stressed the importance of standardised protocols and shared data access across a range of data types, and **encouraged** their adoption across international cetacean research programmes.

19.1.3 Killer whales in the Southern Ocean

The principal investigators once again participated as 'visiting scientists' on board the tour vessel M/V *National Geographic Explorer*, during four consecutive trips to the Antarctic Peninsula from 7 January to 15 February 2012; approximately 3,000 photo-ID images of over 200 individually-recognisable animals for future mark-recapture analyses were obtained; two skin biopsy samples were obtained (samples archived at SWFSC), and three individuals were satellite-tagged. Data are presented in the full project report in Annex 1 of SC/64/O13. Other tour ships operating in the Antarctic Peninsula area were also canvassed for killer whale photographs and thousands of images were obtained from over two dozen killer whale encounters. The principal investigators feel confident that within the next year or two they should have enough images to estimate population sizes for the three types of killer whales that are recognised in the Peninsula Area.

The Committee **commends** the work of the principal investigators.

The Committee was also informed of new killer whale photo-ID data from the Institut Polaire Française (IPEV) Cétacés Terre Adélie project that is available for 35 individuals in Terre Adélie, eastern Antarctica (SC/64/SM6).

19.1.4 Foraging ecology and predator prey interactions of baleen whales and krill

During the funding period, significant progress was made towards the overall goal of understanding the foraging ecology and predator-prey interactions between baleen whales and krill in the waters around the Western Antarctic Peninsula. Analysis was completed describing the diving behaviour of humpback whales from suction-cup tags deployed in 2009 and 2010. These results were presented at numerous scientific meetings including the Biennial Conference on the Biology of Marine Mammals (Tampa, FL, November 2011), and the recent SORP Workshop on non-lethal research techniques for studying cetaceans (Puerto Varas, Chile, March 2012). A full project report is included in Annex 1 of SC/64/O13.

The main findings of the project to date are summarised below.

(1) Humpback whales were found to feed almost exclusively during night-time hours in late autumn (May/June), spending daylight hours either resting or travelling. The initiation of feeding was often proceeded by deep exploratory dives that are hypothesised to sample the water column to determine where prey are distributed.
(2) Humpback whales appear to achieve or conform to ecological predictions of optimal foraging theory in two significant ways: by increasing the number of feeding lunges executed per dive with increased dive depth; and by targeting higher densities of krill as feeding depth increases.
(3) While both of these findings are significant, the fact that the principal investigators have been able to quantify increases in prey density concurrent to whale feeding is novel. The information provided from this relationship will be a substantial component of the manuscripts that are currently in preparation to be submitted for peer review.
(4) Humpback whales vary the depth of their feeding in relation to the diel vertical movement of krill in the water column.

The Committee **welcomes** these results and **encourages** further work to enhance understanding of humpback whales that overwinter in Antarctica. Gales noted that additional satellite and datalogger work on humpback and minke whales was planned.

19.1.5 Oceania humpback whale mixing
The focus of this project has been on preparing for the proposed 2013 satellite tagging work at the Kermadec Islands and American Samoa (Childerhouse, 2011). The Oceania humpback whale population estimate has been published (Constantine *et al.*, 2012) with a sex-specific POPAN super-population model, which accounted for residents and whales migrating through the survey areas, giving an estimate of 4,329 whales (3,345-5,313) in 2005.

In the winter of 2011, satellite tagging work was undertaken in New Caledonia (Garrigue in collaboration with Zerbini and Clapham) adding to the 2007 (Garrigue *et al.*, 2010) and 2010 tagging efforts. The general trend observed was for the majority (~75%) of whales to head in a south-southeasterly direction once they left the New Caledonia breeding grounds. Some whales stopped at seamounts or other undersea geographic features along the way for varying lengths of time.

The Raoul Island (Kermadec group) single day four hour survey conducted between 08:00 and 12:00hrs was conducted on the 8 October 2011. This adds to the previous three years of October surveys using a standard set of seven land-based locations (Brown, 2009; 2010; Potier, 2008)[30]. Previous whale-counts from these surveys have ranged from 62-153 whales and the 2011 survey counted 126 individual whales (Potier and Shanley, 2012)[30]. The consistently high number of humpback whales observed migrating past Raoul Island, peaking in October, confirms the Kermadec Islands as the southernmost location in Oceania with regular whale sightings and the ideal site to attach satellite tags as the whales migrate south. Constantine will visit the Kermadec Islands in August 2012 to consider this research site. Research in American Samoa conducted in the 2011 field season continued preparation for the planned satellite tagging in 2013.

Future work will focus on addressing two questions.

(1) What is the connection between the humpback whales from Area V feeding grounds and their migratory corridors and breeding grounds in Australia and Oceania?
(2) Do whales from Area V represent a single breeding ground or are they a mix of individuals from several distinct breeding grounds?

A full project report is included in Annex 1 of SC/64/O13.

19.1.6 Fin and blue whale acoustics
Understanding baleen whale distribution and abundance in the Antarctic, particularly blue and fin whales, is complicated by the pelagic distribution of both species, the difficulty of working in the Southern Ocean (SO) and the massive decline of both due to commercial whaling. After a half-century of protection, little is known about the present-day status of each species. Blue and fin whales are congeners that are the largest mammals on earth. Both occur in all oceans of the world with similar distribution patterns. In particular, each species occurs in high latitudes in the Southern Hemisphere. In the Antarctic, blue whales are generally thought to occur closer to the ice edge than fin whales. Blue whales are designated as different subspecies, i.e. Antarctic (*B. m. intermedia*) and pygmy types (*B. m. brevicauda*), and Chilean blue whales are also considered an unnamed subspecies, or at least a separate management unit. In the case of fin whales in the Southern Hemisphere, two subspecies have been considered: *B. physalus quoyi* for the Southern Ocean form; and the pygmy fin, *B. p. patachonica,* found in the northern parts of the Southern Hemisphere.

Both blue and fin whales were targets of commercial whaling, particularly from the early 1900s through the 1930s, leading to heavy depletion. Blue whales were protected internationally from whaling in 1966 and fin whales in 1985. At present, both species are listed as Endangered by the IUCN and there are no reliable population estimates for either species globally. A recent examination of almost 40 years of sighting data resulted in an estimate of 2,280 (CV=0.36) Antarctic blue whales, which is less than 1% of the original population (Branch, 2007). There are no equivalent estimates for Southern Hemisphere fin whales.

From 1978 to 2010 the IWC supported the annual IDCR/SOWER Antarctic cruises that consisted of three circumpolar sets of cruises over multiple years that focused primarily on minke whale abundance but that also provided an estimate of abundance for Antarctic blue whales (Branch, 2004). Only two of the recent cruises focused on fin whales (Ensor *et al.*, 2006; 2007). Given the amount of effort, ship time, high risk of poor weather and cost of sighting cruises, it is unlikely that the tremendous shipboard effort of IDCR/SOWER will be repeated. In order to continue to monitor Antarctic blue and fin whales, the use of a network of long-term passive acoustic recorders has been proposed *in lieu* of dedicated circumpolar visual surveys.

Passive acoustic monitoring is a robust means of monitoring blue and fin whales in remote areas over long time periods, including around the Antarctic. The present analysis of all the available data shows the geographic and seasonal occurrence of blue and fin whales around the Antarctic. However the lack of overlap in the years and

[30]Unpublished field reports.

locations monitored, the differences among instruments and analysis methods used, underlines the need for coordinated effort. To best exploit passive acoustic data long term, a pan-Antarctic monitoring system needs to be put in place and maintained. Thus far there has been a positive response from many countries regarding this project. In the near term the principal investigators need to find the finances and continue instrument development to facilitate a coordinated research effort. Further a single method either for each species or for both needs to be adopted for analysing the data. A review of existing methods for estimating relative abundance from passive acoustic sensors demonstrates that the scientific question of interest will drive the analysis methods chosen. The principal investigators suggest that the Australian Marine Mammal Centre, based at the Australian Antarctic Division, Hobart, maintain a database of the metadata and data from hydrophones and make these freely available if possible.

Acoustic data from a single hydrophone present unique challenges to density estimation: to overcome these, the principal investigators need to improve their knowledge of call rate, acoustic behavior and source level of whales; detection distance and sound propagation (environmental parameters and ambient noise level). Methodology to estimate the density of whales from acoustic data is advancing rapidly and it is anticipated that if understanding of the parameters above is improved, density estimation using passive acoustic data will become the state of the art for monitoring Antarctic blue and fin whales. A full project report is included in Annex 1 of SC/64/O13.

The Committee **commends** the work of the principal investigators and it was noted that this project addresses the research priorities identified by SORP to meet the overall objectives of the IWC.

It was highlighted that it will provide valuable data for blue whales and may provide the only practical way to obtain data about fin whale abundance, information that the scientific community currently does not have. From this data it may be possible to estimate trends in blue and fin whale populations over decadal scales.

This work is closely aligned with the objectives of the Antarctic Blue Whale Project. It was also noted that that the global economic situation is very likely to reduce the amount of ship time available to researchers in the future, therefore the development of acoustic methods such as these are essential for continued, non-lethal cetacean research.

19.1.7 Living Whales Symposium and non-lethal research techniques Workshops

SC/64/O14 summarised the SORP Symposium and Workshops entitled 'Living whales in the Southern Ocean: advances in methods for non-lethal cetacean research'.

The Symposium and accompanying Workshops were held in Puerto Varas, Chile from 27-29 March 2012, to discuss recent advances in methods for non-lethal research on whales in the Southern Ocean. The Symposium was attended by 124 registered participants from 16 countries and was also live streamed on the web, allowing 1,553 simultaneous viewers.

The first day was an open Symposium with invited experts who showcased new non-lethal research methods for whales in the Southern Hemisphere. The Symposium talks were divided across five sessions that covered an overview of the history of whaling, evolution of non-lethal techniques and the role of whales in Southern Ocean ecosystem. These were followed by sessions on molecular techniques, biologging, remote sensing and long-term non-lethal research. A PDF of the talks are already available[31] and videos of each talk, in English and Spanish, will soon be available.

The Symposium was followed by two days of Workshops that covered specific research areas. The Workshops were each one day in duration and covered the following topics:

(1) health assessment of live cetaceans;
(2) advances in long term satellite tagging techniques for Cetaceans;
(3) population dynamics and environmental variability; and
(4) estimation of diet and consumption rates from non-lethal methods.

The Workshop health assessment of live cetaceans reviewed several techniques obtained from blow samples, biopsy samples, collection of faeces, visual health assessment, photogrammetry, blow intervals and respiration rates, among others. The Workshop identified two main aspects:

(1) health assessment data and studies should be integrated with population dynamics data, where possible; and
(2) integration of live animal health assessment with studies on dead and stranded animals, particularly within the same geographical region, is highly informative and should be a priority. The priority areas for further consideration in health assessment include nutritive stress and body condition; feeding and fasting or starvation state; skin lesions; stress; emerging issues and exposures; and particularly, standardisation of methodologies.

The Workshop on large whale population dynamics and environmental variability explored which life history parameters can be connected with environmental variability and highlighted the need for researchers to collect data on body condition, mortality and reproductive output, among others. The Workshop also evaluated different analytical and simulation techniques to incorporate environmental variability into population models and recognised the need of long term data sets to detect such effects. The Workshop recommended that long-term studies, photo-ID and biopsy sampling be routinely collected and promoted the use of geochemical tracers (e.g. stable isotopes) and other 'eco-markers', including DNA, since this approach can help to identify foraging locations of populations.

The Workshop 'Advances in Long-Term Satellite Tagging Techniques for Cetaceans and their Application to Address Research Questions in the Southern Ocean' reviewed advances on tag development and dedicated studies to address possible physical and physiological effects of satellite tags on cetaceans. The Workshop highlighted that effort could be directed to minimise the size and diameter of body-penetrating satellite tags in order to minimise trauma of implant and water ingress and promoted the use of an alternative to body-penetrating tags, such as new designs with external electronics and a long anchoring system. It was agreed that new designs for cetacean tags ought to be developed and that priority should be given to accelerometer and dive/surface interval data and to the development of algorithms that can compress data for transmission via ARGOS. The Workshop also recognised that some devices have the potential to cause considerable tissue damage and that studies on carcasses derived from incidental mortality should be conducted, as well as monitor tagged animals. Finally, the

		Support for coordination and development activities	15,926	15,926
		Steering Committee meeting*	4,778	0
SORP5: humpback whales	Constantine	Photo-ID and tissue sampling	9,548	9,548
		Project assistant**	6,376	6,376
		Steering Committee meeting*	3,819	0
SORP 6: Symposium	Baker/Galletti	-	0	0
Total requested 2012/13			94,202	
Total allocated 2012/13				**66,608**

[#]The Committee requested clarification of the use of the money requested for consideration intersessionally. *No money was allocated to individual projects for Scientific Steering Committee meetings because of proposals to hold a SORP conference in 2013 (see work plan item 6). **The principal investigators also requested £182,748 GBP to support research in 2013/14. It was noted that SORP cannot support such large requests for money. Therefore, the Committee **encourages** that SORP funds allocated for 2012/13 be used in part to allow the project assistant to write proposals for additional project funding.

Workshop highlighted the need to create awareness on the use of these techniques within local communities, regulatory agencies and the general public prior to any tagging project.

The Workshop on 'Estimation of Diet and Consumption Rates' highlighted several techniques that might be used to achieve this difficult objective. Tagging studies could provide information about foraging effort, photogrammetric techniques about individual fitness and steroid-hormone samples (from faeces or biopsy) about reproductive status. Understanding interspecific differences in prey preference will help to predict how climate driven changes affect krill and, ultimately whales. The value of understanding how local oceanographic conditions and prey availability affect the foraging behaviour and distribution was highlighted. Also recognised was the need to improve understanding of foraging strategies, prey choices, feeding destinations, etc. and recommended the use of several dietary tracers, such as stable isotope analysis, and molecular techniques, for diet reconstruction alongside fecal sampling and fatty acid analysis.

In summary, the Symposium and Workshops were very successful. The event drew a large audience and the Symposium organisers recommend the use of live broadcast technologies alongside simultaneous translation as a means to reach a wider audience in future events. The Workshops gave an excellent overview of existing and new research techniques and contributed enormously toward setting guidelines and prioritising research needs for improving our current scientific understanding and techniques.

The Symposium organisers and the SORP Scientific Steering Committee thanked the sponsors of the Symposium and Workshops: the Ministry of Foreign Affairs, Chile; the directorate of Maritime Territory and Merchant Marine of Chile; the Australian Government; the National Oceanic and Atmosphere Administration of the United States (NOAA); Oregon State University; the International Fund for Animal Welfare; the South Pacific Research Whale Consortium; Altavoz; and the Cetacean Conservation Center Chile. The Symposium and Workshops represent a completed Southern Ocean Research project. The full report can be found in SC/64/O14.

The Committee **thanks** the Symposium organisers, in particular Galletti, Baker and their teams for their work and congratulated them on their success. The usefulness of the Symposium and Workshops for improving current non-lethal techniques for cetacean research was stressed. It was noted that some of these will be applied to research to be conducted in the coming field season, e.g. by Argentinean researchers. It was also noted that useful recommendations came out of the Workshops with regard to research on climate change impacts on cetaceans, e.g. southern right whales in the southwest Atlantic, in line with wider SORP objectives.

19.2 Budget

The IWC has a budget specifically related to the work of SORP established with a contribution from Australia in 2008 and supplemented by additional voluntary contributions from Australia and the USA in 2011. This budget is administered by the IWC Secretariat.

19.2.1 Budget overview

Bell presented a summary of the SORP money spent to date and remaining funds. A total of £76,947 remains unallocated and unspent. A figure of approximately £37,730[32] remains in the SORP budget allocated but unspent.

19.2.2 Request for funds from projects

Table 10 summarises the requests for SORP funds received from existing SORP projects for 2012/1.

SC/64/O17 requested £2,500 for the South African Blue Whale Project (SABWP; SC/64/O17) to support travel for one investigator, Meredith Thornton, from South Africa to Greenland to participate in a week-long cruise cruise in which five Autonomous Acoustic Recorders (AARs) will be deployed west of Disko Bay in August 2012. The cruise will be led by the Greenland Climate Research Centre and Applied Physics Laboratory of Washington University. The intention is that the investigator gain the necessary technical experience in deployment of AARs at sea, that otherwise might entail an experienced person accompanying a long supply voyage from Cape Town to the ice and back just for a few days' work. An official response from the organisers of the cruise has still not been received.

[32]This figure has not been finalised because of possible outstanding invoices from the 2011/12 allocation to SORP Project 6.

The Committee **approved** this request for funding.

Funding requests from existing core SORP research projects for 2012/13 are outlined in Table 10 alongside the agreed allocations.

19.2.3 Reallocation of funds

A small group was formed consisting of the SORP Scientific Committee and other interested parties to discuss reallocations of remaining SORP funds to projects in 2012/13.

A figure of £37,730 remains in the SORP budget allocated but unspent. The Committee **agrees** that £11,700 of this be reallocated to the Antarctic Blue Whale Project and the remaining £26,030 be rolled-over into the general SORP budget for reallocation in the future.

19.2.4 Allocation of funds

The Committee **agrees** to allocate SORP funds for 2012/13 as outlined in Table 10.

19.2.5 Seeking additional funding

Following the reallocations and 2012/13 allocations, £48,069 will remain in the SORP budget administered by the IWC Secretariat.

The Committee **thanks** the Governments of Australia and the USA for their generous contributions to the SORP and **encourages** support and voluntary contributions from other nations to ensure the continuation of this exciting initiative.

19.3 Requirements for formalising participation in SORP and development of new projects

The Committee is keen to promote continued and new involvement in SORP. Partners are **encouraged** to formalise their involvement in the form of a letter to the SORP Secretariat. If Partners require more formal protocols, such as a Memorandum of Understanding, this can be arranged by the SORP Secretariat. The Committee **encourages** the involvement of new and existing Partners in SORP scientific steering committees, working groups and technical committees.

19.4 Work plan

The work plan is discussed under Item 21. The Committee **agrees** that data management and sharing was an important issue to consider. Gales reiterated the importance of work plan item 7.

20. RESEARCH AND WORKSHOP PROPOSALS AND RESULTS

20.1 Review results from previously funded research proposals

Research results from previously funded proposals are dealt with under the relevant agenda items.

20.2 Review proposals for 2012/13

No unsolicited research proposals were received this year. Proposals for the voluntary fund for small cetaceans were discussed under Item 14.3 and those relating to SORP are discussed under Item 19.

Table 11 lists the proposed intersessional meetings and Workshops. Financial implications and further details are dealt with under Item 23.

21. COMMITTEE PRIORITIES AND INITIAL AGENDA FOR THE 2013 MEETING

As in recent years and with the Scientific Committee's agreement, the Convenors met after the close of the Committee meeting and finalised the following basis for an initial agenda for the 2013 meeting. The same criteria as previous years were taken into account and this was based on the recommended work plans developed by sub-committees and the general discussion of these within the Committee. The Committee **recognises** that it is the Commission who establishes the Committee's overall priorities. Thus priorities may have to be reviewed in light of decisions made by the Commission. Items of lower priority on sub-committee agendas will only be discussed if time allows. Therefore, the Committee **stresses** that papers considering anything other than priority topics will not be addressed at next year's meeting. This information will be included on the website when the information about document submission is published next year. Convenors will receive timely information on the titles of papers intended for the discussion within their groups, and may contact authors if they believe the papers are unlikely to be discussed.

Revised Management Procedure (RMP)

The following issues are high priority topics:

(1) review new information on western North Pacific Bryde's whales;
(2) conduct an *Implementation Review* for North Atlantic fin whales starting during a pre-meeting before SC/65 and continuing during the 2013 Annual Meeting;
(3) prepare for the 2014 *Implementation Review* for the North Atlantic minke whales; and
(4) review information available for North Atlantic sei whales in the context of a *pre-Implementation assessment.*

Western North Pacific common minke whales (NPM)

Complete *Implementation Review* (including hold inter-sessional Workshop).

Bycatch and other human induced mortality (BC)

The focus of the group will remain in estimating mortality due to bycatch and ship strikes. The work plan will include:

Table 11

Proposed Workshops for the intersessional period.

Subject	Agenda item	Venue	Dates
Review of MSYR Workshop and WNP common minke whale Second Intersessional Workshop	5.1; 6.6	La Jolla, CA, USA	Late Feb.-Apr. 2013
AWMP Greenland hunt *SLA* development	8.3	Copenhagen, Denmark	3 days within 12-18 Dec. 2012
Planning for the 2013 IWC-POWER cruise	10.8.1.3	Tokyo, Japan	25-27 Oct. 2012
Workshop on Arctic anthropogenic impacts on cetaceans	12.5.3	Anchorage, Alaska	Late Feb.-Mar. 2013
Workshop on assessing the impacts of marine debris	12.7	Korea (SC meeting venue)	4 day pre-meeting; mid-May-mid Jun 2013
'Marine bushmeat' Workshop	14.6	Korea (SC meeting venue)	2 day pre-meeting; mid-May-mid Jun. 2013
Icelandic Special Permit expert panel review Workshop	17.1.3	Reykjavík, Iceland	Feb.-Mar. 2013

(1) reviewing progress in including information in online National Progress Reports;
(2) estimating risk and rates of bycatch and entanglement;
(3) development of methods to estimate mortality from ship strikes;
(4) continuing development and use of the international database of ship strikes; and
(5) review of information on other sources of mortality.

Special Permits
(1) Review results of the expert Workshop on the Icelandic special permit programme;
(2) plan for expert Workshop on JARPA II; and
(3) review new and existing proposals as appropriate.

Bowhead, right and gray whales (BRG)
High priority items will include:
(1) perform the annual review of catch information and new scientific information for B-C-B stock of bowhead whales and eastern gray whales;
(2) review any new information on all stocks of right whales, especially results of assessments for southern right whales;
(3) review North Pacific gray whale stock structure and movement; and
(4) review any other new information on western and eastern North Pacific gray whales and other stocks of bowhead whales.

Environmental concerns (E)
(1) Receive the SOCER (focus: Atlantic Ocean);
(2) pollution issues;
(3) Cetacean Resurging and Emerging Diseases (CERD);
(4) impacts of anthropogenic sound;
(5) climate change issues;
(6) marine debris and cetaceans (including report from the marine debris Workshop);
(7) other habitat-related issues:
MREDs;
cumulative impacts; and
(8) unusual mortality events including Peru.

Ecosystem modelling (EM)
(1) Modelling of the direct relationship between baleen whale populations and the abundance of their prey; and
(2) coordination with CCAMLR's Ecosystem Monitoring and Management Programme will also be sought on its efforts to advance krill-predator models.

Aboriginal Subsistence Whaling Management Procedure (AWMP)
(1) Highest priority will be to work towards the development of long-term *SLA*s for the Greenland hunts:
   (a) develop trial structures and operating models for the Greenland hunts of bowhead and humpback whales to be presented initially at an intersessional Workshop;
   (b) develop an AWMP/RMP-lite program to assist developers of *SLA*s for the Greenland hunts of fin and common minke whales; and
   (c) review a full scientific paper on the work in Greenland related to the collection of information on conversion factors;
(2) present *Evaluation* and *Robustness Trial* results to the SWG of an *SLA* variant that corresponds exactly to the management plan proposed by the Makah Tribe to the US Government;
(3) review a revised document on the probability of a gray whale that regularly feeds in the western North Pacific being taken in a Makah hunt; and
(4) review a document that provides advice on the development of *SLA*s and their evaluation.

In-depth assessment (IA)
High priority will be given to:
(1) the development and application of the SCAA models to the agreed estimates and the most recent aging data;
(2) further work examining reasons for the differences between estimates from CPII and CPIII; and
(3) further development of the IWC simulated datasets, specifically to:
   (a) provide a testing framework for hazard probability models for internally-estimated cue rates from Antarctic minke whale schools; and
   (b) provide one realistic scenario for testing variance estimation.

Now that minke whale abundance estimates had been agreed, the main remaining issues are listed as follows:

(4) modify the Hazard Probability model to cope better with real diving patterns;
(5) improve remaining misfits, for example, to the way that the simultaneous/delayed duplicate fit changes with school size (linked to item 4 above); and
(6) embed refined Hazard Probability models into a spatial framework.

Lower priority items are:

(7) data management:
   (a) further validation of IDCR/SOWER data;
   (b) curation of experimental IDCR/SOWER data;
   (c) production of standard datasets for analyses of species other than Antarctic minke whales; and
(8) review of abundance estimation data collected during CPII and CPIII; their utility for estimating abundance of Antarctic minke whales; and review of data insights.

Southern Ocean Research Partnership (SORP)
Work plan items include:
(1) establishment of ABWP management structure and Committee;
(2) establishment of intersessional technical committees for methodological development;
(3) refinement of the ABWP survey plan for the 2013 ABW voyage(s);
(4) development of uniform sampling protocols for ABW sampling and voyage(s);
(5) continuation of five ongoing SORP research projects;
(6) planning and implementation of an intersessional SORP conference prior to the next annual meeting; and
(7) intersessional development of a paper on data management and legacy.

22. DATA PROCESSING AND COMPUTING NEEDS FOR 2012/13

The Committee agrees the requests for intersessional work by the Secretariat given in Table 12.

23. FUNDING REQUIREMENTS FOR 2012/13

Table 13 summarises the complete list of recommendations for funding made by the Committee. The total required to meet its preferred budget is £327,000. The Committee recommends all of these proposed expenditures to the Commission.

Table 12

Computing tasks/needs for 2012/13.

RMP – PREPARATIONS FOR *IMPLEMENTATION*

(1) Work with the Norwegian Computing Centre to modify the Norwegian CatchLimit program so that only standard FORTRAN-95 statements are used (Annex D, item 2.4).

(2) Work to specify and run additional trials for testing amendments to the *CLA* (Annex D, item 2.2).

(3) Work related to the *Implementation Review* for North Atlantic fin whales (Annex D, item 3.2)

(4) Run a full set of trials using the Norwegian 'CatchLimit' program for North Atlantic fin whales, western North Pacific Bryde's whales; and North Atlantic minke whales and place the results on the IWC website (carried over from last year).

NPM

Complete conditioning of the North Pacific minke whale trials and run a full set of trials (Annex D1).

AWMP

Work arising from the proposed workshop (see Annex E, item 4).

IN-DEPTH ASSESSMENT

Prepare a catch series for North Pacific sei whales including incorporation of additional information from Japanese log book records and a new analysis of Soviet North Pacific catch records (see Annex G, item 7).

Validation of the 2011 POWER cruise data (see Annex G, item 8).

Complete validation of the 1995-97 blue whale cruise data and incorporate into the DESS database.

WHALE STOCKS

Documentation of the catch data available for Antarctic minke whales in preparation for the *pre-Implementation assessment* (see item 10.1, carried over from last year).

However, it understands that the projected amount available for funding is about £315,000. Following some initial suggestions produced by the Convenors group, the Committee therefore carefully reviewed the proposed full list, taking into account its work plan, priorities and the possibility that some of the work requiring funding could be postponed to a future year or years. Such considerations are difficult and the Committee **stresses** that projects for which it has had to suggest reduced funding are still important and valuable. Should the Commission be unable to fund the full list of items in Table 13 the Committee agrees that the final column given in the table represents a budget that will allow progress to be made by its sub-groups in its priority topics. Progress will not be possible in some important areas, as outlined below and the Committee **strongly request** that the Commission or individual member governments provide additional funding in these areas. The Committee **strongly recommends** that the Commission accepts its reduced budget of £315,000.

A summary of each of the items is given below, by sub-committee or standing Working Group. Full details can be found under relevant Agenda Items and Annexes as given in Table 13.

Aboriginal Whaling Management Procedure (AWMP)

(1) DEVELOPMENT OF AN OPERATING MODEL FOR WEST GREENLAND HUMPBACK AND BOWHEAD WHALES

The Committee developed interim *Strike Limit Algorithms* (*SLA*s) for the minke, fin, humpback and bowhead whales off West Greenland. These *SLA*s need to be reviewed and perhaps revised, ideally by the 2017 Annual Meeting. Development of *SLA*s for the hunts of minke and fin whales can be coordinated with the *Implementation Reviews* for these whales which are being conducted by the RMP sub-committee. In contrast, the situations for humpback and bowhead whales are relatively straightforward (essentially single-stock situations), but without a fully-specified and coded operating model progress on these cases will be limited. The first step in the process of developing *SLA*s is constructing an operating model and associated trials, and this project aims to make sufficient progress that an AWMP Workshop (in late 2012) could finalise trials and initiate testing.

The key activities covered by the proposal:

(1) extend the single-stock gray whale trials so that trials can be conducted for humpback and bowhead whales;

(2) outline a set of *Evaluation* and *Robustness Trials* which could form the basis for the evaluation of *SLA*s for these two groups of whales;

(3) present the trial specifications and results for: (a) the interim *SLA*s; and (b) an alternative *SLA* at an intersessional AWMP Workshop; and

(4) develop an AWMP/RMP-lite to assist developers of *SLA*s for the cases of fin whales and common minke whales.

(2) WORKSHOP ON DEVELOPMENT OF *SLA*S FOR GREENLANDIC HUNTS

The existing interim safe procedure for the Greenlandic hunts agreed in 2008 (IWC, 2009c) was agreed to be valid for quota blocks up to 2018. The Committee has identified completion of the development of long-term *SLA*s for these hunts as high priority work. With the completion of the B-C-B bowhead and gray whale *Implementations* this year, the SWG on the AWMP will give highest priority to the Greenland work, particularly for the complex cases of common minke whales and fin whales. In addition to the proposal for work by Punt (Annex E, Appendix 6), to meet the proposed timeframe an intersessional Workshop is required. The objectives of the Workshop are to: (1) review the work undertaken by Punt to develop proposed operating models and trial structures for the relatively easy cases of the bowhead and humpback whale hunts with a view to finalising these at the 2013 Annual Meeting; and (2) review the work undertaken by Punt to develop simple (AWMP/RMP-lite programs) to facilitate initial work on developing potential *SLA*s to allow the development of *SLA*s for West Greenland fin and common minke whales in light of the current operating models used in RMP *Implementations*. The Workshop will be held in winter 2013 for four days in Copenhagen, Denmark and the costs are for IP travel.

(3) AWMP DEVELOPERS FUNDS

The developers fund has been invaluable in the work of *SLA* development and related essential tasks of the SWG. It has been agreed as a standing fund by the Commission. The primary development tasks facing the SWG are for the Greenlandic fisheries. As noted above these tasks are of high priority to the Committee and the Commission. The fund

Table 13

Budget requests (see text). Note that in addition, the budget request for SORP is given in Table 10.

	Title	Agenda Item	Full (£)	Reduced (£)
(1)	Development of an operating model for West Greenland humpback and bowhead whales	8. AWMP	5,000	5,000
(2)	Workshop on development of *SLA*s for Greenlandic hunts	8. AWMP	8,000	8,000
(3)	AWMP developers funds	8. AWMP	3,000	3,000
(4)	Ship strike database coordinator	7.8 Ship strikes	10,000	8,000
(5)	Right whale survey off of South Africa	10.5 SH right whales	21,730	21,730
(6)	Genomic diversity and phylogenetic relationships among right whales	10.6 N Pacific right whales	7,000	0
(7)	Photographic matching of gray whales	9.2 E Pacific gray whales	9,000	9,000
(8)	Contribution to the preparation of the State of the Cetacean Environment Report (SOCER)	12.1 SOCER	3,000	3,000
(9)	Pre-meeting Workshop on assessing the impacts of marine debris	12.8 Habitat related issues	20,500	20,500
(10)	Develop simulation of Southern Hemisphere minke line transect data	10.1 Antarctic minke whales	9,000	5,000
(11)	IWC-POWER cruise	10.8.1 IWC-POWER cruise	60,754	60,754
(12)	Preparation for the application of the statistical catch-at-age assessment method for Southern Hemisphere minke whales	10.1 Antarctic minke whales	4,000	4,000
(13)	'Second' intersessional workshop on the *Implementation Review* for WNP common minke whales	6.3 N Pacific common minke whale *Implementation Review*	20,000	18,500
(14)	Essential computing for RMP/NPM and AWMP	22. Data processing and computing needs	25,000	25,000
(15)	MSYR review Workshop	5.1 MSY rates review	5,000	5,000
(16)	Review and guidelines for model-based and design-based line transect abundance estimates	5.7 Abundance estimates	5,000	5,000
(17)	Modelling of Southern Hemisphere humpback whale populations	10.2 SH humpback whales	3,000	3,000
(18)	Antarctic humpback whale catalogue	10.1 Antarctic minke whales	15,000	13,000
(19)	Photo matching of Antarctic blue whales	10.3 SH blue whales	3,000	3,000
(20)	Southern Hemisphere blue whale catalogue 2012/13	10.3 SH blue whales	3,000	3,000
(21)	Expert Workshop for final review of Iceland's Special Permit programme on common minke whales	17.1 Review of existing scientific permits	30,000	24,000
(22)	Whalewatching guidelines and operator training in Oman	10.7 Arabian Sea humpback whales	3,500	3,500
(23)	Invited Participants (IPs) funds	All	64,000	64,000
Total			337,484	314,984

is essential to allow progress to be made. It now stands at £12,000 and a request of £3,000 is made to restore it to the initial target level of £15,000.

Bycatch and other human-induced mortality

(4) SHIP STRIKE DATABASE COORDINATOR

The ongoing development of the IWC ship strike database requires data gathering, communication with potential data providers and data management. The Working Group on Bycatch and Other Human Induced Mortality recommended a part-time post initially for three months a year to undertake the tasks described in Annex J. This includes:

(1) identify national contact points, organisations or groups that hold data on ship strikes that have not been contributed to the database and facilitate and encourage contributing data to IWC database;
(2) monitor and respond to emails addressed to the *shipstrikes@iwcoffice.org* email address, including reports of new incidents, giving feedback to data providers and dealing with requests for summary information from the database;
(3) keep IWC ship strike website pages up to date including updating publicly available summaries from the database;
(4) develop and document a communication strategy;
(5) provide an annual update to the Scientific Committee;
(6) data entry of new records including data presented in meeting papers and National Progress Reports at Annual Meetings of Scientific Committee;
(7) work with the data review group to ensure that all new records are appropriately reviewed including identification of potential duplicate reports;
(8) further development of database handbook including criteria for determining whether ship strike was a cause of death;
(9) ensure database documentation remains up to date; and
(10) maintain database and data entry system, making adjustments as appropriate in response to user problems and suggestions.

Bowhead, right and gray whales

(5) RIGHT WHALE SURVEY OFF SOUTH AFRICA

The southern right whale population visiting the South African coastline (arguably the largest in the Southern Hemisphere) has been monitored annually by aerial surveys since 1971 and since 1979 by a photo-ID survey. The results have been presented to several meetings of the Scientific Committee, such as the Buenos Aires Workshop in September 2011, where four papers were presented (Best, 2011; Brandão *et al.*, 2011; Butterworth *et al.*, 2011; Roux *et al.*, 2011). Since its inception the photo-ID surveys have concentrated on adult females with calves: the catalogue (at 2010) stands at 1,217 adult females, of which resighting rates average 70% annually, leading to very precise estimates of population size and growth rate, adult survival rate, age at first parturition and juvenile female survival rate. The application of an individual-based model has now allowed estimation of the probability of females calving at various intervals (SC/64/BRG24), which can be correlated in turn with the occurrence of oceanographic anomalies to determine the influence of environmental variation on reproductive success. The project has been funded domestically almost since its inception and has just completed a 3-year funding cycle. Unfortunately an application to the South African National Antarctic Programme for renewed funding was rejected as being geographically inappropriate, so interim funding is being sought to enable the 2012 survey to take place while an application is made for a new cycle commencing in 2013. The survey is scheduled to take place in mid-October. All images should be matched by 1 April 2013 and results ready for the 2013 Scientific Committee meeting.

(6) GENOMIC DIVERSITY AND PHYLOGENETIC RELATIONSHIPS AMONG RIGHT WHALES

The investigators request supplemental funding, as described in SC/64/BRG15, to do the following:

(1) assess genetic diversity and estimate N_{min} within the central North Pacific right whale population, represented by 27 individuals (including three from Russia), using complete mitochondrial genomes and sequence from 23 nuclear loci;
(2) compare mtDNA diversity in eastern North Pacific right whales with other oceanic populations based on complete mitochondrial genomes (16,386 base pairs), rather than the limited resolution currently based on control region sequences (286 base pairs); and
(3) confirm reciprocal monophyly and phylogenetic relationships among right whale species using sequence from complete mitochondrial genomes and 23 nuclear loci.

The primary funding for this project, provided by the Pacific Life Foundation, has support the development of the primary datasets but this funding is now exhausted. This proposal seeks supplemental support for two months for a postdoctoral fellow to complete analysis of the primary dataset and estimation of N_{min} for the central population of the North Pacific right whale.

(7) PHOTOGRAPHIC MATCHING OF GRAY WHALES

Results regarding mixing of western (WNP) and eastern (ENP) gray whales illustrate the great conservation and management importance of a more comprehensive examination of gray whale movement patterns and population structure in the North Pacific. The Committee noted that for such an effort to be successful it must be international and collaborative. To facilitate this, and noting the existing safeguards for collaborators provided under the Committee's Data Availability Agreement, it recommended that a collaborative Pacific-wide study be developed under the auspices of the IWC, recognising that *inter alia* this will contribute to the Committee-endorsed Conservation Plan for Western North Pacific Gray Whales and incorporate previous recommendations made by the Committee. Such a study should involve collaborative analysis and sharing of existing data as well as the collection of new data (IWC, 2011f). This is the second year of the project. The report of the results of the first year was presented in the document SC/64/BRG13. The funds requested for this year are to match gray whale photographs to photographs from Sakhalin and Kamchatka.

Environmental concerns

(8) CONTRIBUTION TO THE PREPARATION OF THE STATE OF THE CETACEAN ENVIRONMENT REPORT (SOCER)

SOCER is a long-standing effort to provide information to Commissioners and Scientific Committee members on environmental matters that affect cetaceans in response to several Commission Resolutions. The focus for 2012 will be on the Indian Ocean. Funds are for salaries, library services and printing.

(9) PRE-MEETING WORKSHOP ON ASSESSING THE IMPACTS OF MARINE DEBRIS

In 2011, the IWC agreed to: (1) endorse the Honolulu Commitment; (2) establish a standing item on marine debris on the Conservation Committee agenda; and (3) request the Scientific Committee continue reviewing potential threats to cetaceans arising from marine debris. It is proposed that a Workshop be held on marine debris and cetaceans where the primary aim is to develop tools that allow quantification of whether or how marine debris is affecting cetaceans and how best to monitor and mitigate for these effects.

The objectives of the Workshop are to:

(1) better understand the effects of debris interactions at an individual and population level;
(2) identify and classify key types and sources of debris that contribute to entanglements, or are ingested by cetaceans and examine the mechanisms by which they arrive in the marine environment, with the goal of identifying possible mitigation measures;
(3) design and develop a centralised database to collate cases of debris interactions to obtain more accurate estimates of the incidence of mortality and injuries, help detect trends over time and identify hotspots; and
(4) contribute towards a quantitative assessment of the extent of the threats for cetaceans.

The report of the Workshop will, in addition to providing the analyses, review and recommendations listed under item 2 above, develop: (1) a series of research and conservation actions that will include a rationale, actions required and proposed responsible persons/groups; and (2) a two-year work plan to be considered. The report will be submitted to the IWC and made publicly available on the website. It is proposed to publish the results of the Workshop in a peer-reviewed journal. Funds are to assist some of the expected 20 participants for a four-day pre-meeting held before the 2013 Scientific Committee meeting.

In-depth assessments

(10) DEVELOP SIMULATION OF ANTARCTIC MINKE WHALE LINE TRANSECT DATA

This year an abundance estimate for Antarctic minke whales had been agreed upon. As discussed this estimate had to use externally-estimated cue rates from a small sample of Antarctic minke whales, though an internally estimated cue rate would be preferred to estimate a more accurate and perhaps precise estimate. However, additional methodological development is needed to achieve this. To test these newly developed methods, it was proposed to use simulated line transect data where the true abundance estimate is known to validate the new methods are working correctly. These funds are proposed to further develop the IWC simulated datasets to: (a) provide a testing framework for hazard probability models for internally-estimated cue rates from Antarctic minke whales schools; and (b) provide a realistic scenario to test variance estimation methods.

(11) IWC-POWER CRUISE

The Committee has strongly advocated the development of an international medium- to long-term research programme involving sighting surveys to provide information for assessment, conservation and management of cetaceans in the North Pacific, including areas that have not been surveyed for decades. The finalisation for the integrated mid-long-term program (IWC-POWER; the Pacific Ocean Whales and Ecosystem Research programme) that will provide information on stock structure, abundance and ultimately trends has been completed. The focus of the 2013 cruise is defined as the area bounded by longitudes 135°W and 160°W, and latitudes 30°N and 40°N. Line transect sightings, abundance data collection, biopsy sampling, and photo-ID of cetaceans is planned. The cruise will last approximately 60 days between July and August 2013. By far the most important component of the cost, the provision of a research vessel, crew and fuel (up to US$1m) and that is generously being provided by Japan. The IWC funding will provide for international researchers, equipment and a meeting to finalise the details of the 2013 cruise.

(12) PREPARATION FOR THE APPLICATION OF THE STATISTICAL CATCH-AT-AGE ASSESSMENT METHOD FOR ANTARCTIC MINKE WHALES

This year the Committee received a full description of the statistical catch-at-age (SCAA) developed by Polacheck and Punt, along with initial suggestions for a baseline analysis and sensitivity tests (SC/64/IA1). This approach allows for errors in CAA data, more than a single stock, time-varying growth, multiple areas, environmental covariates, fleet-specific vulnerabilities, and changes over time in vulnerability. The SCAA can be used to evaluate various hypotheses regarding the reason (or reasons) for the change in abundance estimates from CPII to CPIII, as well as other questions regarding the dynamics of the Antarctic minke whale, such as whether growth and carrying capacity have changed. This proposal is to obtain the latest datasets and update the outputs and reference models to conduct baseline and key sensitivities. A final report will be presented to the 2013 Annual Meeting and the final code, data sets and documentation will be lodged with the Secretariat.

North Pacific minke whales

(13) 'SECOND' INTERSESSIONAL WORKSHOP ON THE *IMPLEMENTATION REVIEW* FOR WESTERN NORTH PACIFIC COMMON MINKE WHALES

The *Implementation Review* for western North Pacific minke whales is more complex than any previous *Implementation*. The Committee is one year behind the normal Schedule for *Implementations*. The Committee is not ready to undertake the tasks allocated to the 'second' intersessional Workshop according to its guidelines (IWC, 2012h). The priority tasks are to run and evaluate all trials in accordance with guidelines and present the results at the 2013 Annual Meeting to enable the Committee to complete its review in 2013.

Revised Management Procedure

(14) ESSENTIAL COMPUTING FOR RMP/NPM AND AWMP

The approach used to evaluate RMP variants during *Implementations* as well as candidate *SLA*s involves two main steps: (1) specification and conditioning of trials; and (2) projecting simulated populations forward under alternative RMP variants/*SLA*s. The complexity of the operating models on which simulation evaluations are conducted has increased in recent years. Unfortunately, the relatively simple optimisation methods included in current control programs (which was more than adequate in the past), combined with a complicated objective function, has led to problems producing conditioned trials quickly. This proposal will provide the Secretariat with the essential support required to complete this issue during the intersessional period. It will also continue the arrangement of recent years by which essential support is provide to the Secretariat, particularly in the key area of estimating stock mixing proportions in input to the trials, both intersessionally, and during meetings. Without this support it will be impossible for the Committee to undertake its present work on RMP *Implementations* and development of *SLA*s.

(15) MSYR REVIEW WORKSHOP

Since 2007 the Committee has been discussing maximum sustainable yield rate (MSYR) in the context of a general review of the plausible range to be used in population models used for testing the *Catch Limit Algorithm* (*CLA*) of the RMP. The Committee has agreed that it will finish work on this topic in 2013 whether or not the review can be completed. It has developed a work plan to try to ensure completion of the review. As part of this it is essential that a three-day intersessional meeting be held, with at least five participants, ideally back-to-back with another intersessional meeting, thus reducing overall costs of this Workshop.

All sub-groups using abundance estimates

(16) REVIEW AND GUIDELINES FOR MODEL-BASED AND DESIGN-BASED LINE TRANSECT ABUNDANCE ESTIMATES

The RMP's 'Requirements and Guidelines for Conducting Surveys' (IWC, 2012x) were written when the only realistic paradigm for planning and analysing good sighting surveys was the design-based approach. However, there is now potentially a legitimate alternative to design-based estimates; model-based estimates using spatial modeling (smoothers), which unlike design-based approaches, also give some basis for limited spatial extrapolation. In addition, many surveys resemble design-based surveys but do not strictly meet the design-based criterion, and in such cases there is a question regarding the adequacy of design-based estimates. The Committee has frequently considered model-based and quasi-design-based estimates, but without explicit criteria and not necessarily in the context of the RMP. This proposal will: (1) review statistical aspects of design-based estimators for surveys which do not strictly adhere to design-based principles; and (2) review past and current issues related to model-based abundance estimators, drawing on examples from experience with these types of models. Empirical and simulation-based diagnostics will be suggested, and a quantitative description of pitfalls when extrapolating estimates beyond the surveyed area will be given. The intended outcome of the project is: (1) propose a basis to assess the reliability of an abundance estimate either from a design-based analysis for which the statistical criteria are not met, or from a model-based analysis; and (2) provide draft text for inclusion in the 'Requirements and Guidelines for Conducting Surveys' document. The work will be presented to the 2013 Annual Meeting and the request is for salary to complete this project.

Other Southern Hemisphere whale stocks

(17) MODELING OF SOUTHERN HEMISPHERE HUMPBACK WHALE POPULATIONS

The project will focus on a combined assessment of Southern Hemisphere humpback breeding stocks D, E and Oceania using the model proposed at this year's meeting, SC/64. Methods used will be based upon the Bayesian methodology as developed and presented for breeding stock C and breeding stock B comprehensive assessments recently completed. Initial results will utilise the data agreed at SC/64, and results will be presented at the 2013 Annual Meeting. Further model developments and refinements in association with the final set of agreed data (and their sensitivities) would be presented at the 2014 Annual Meeting should the Scientific Committee decide to so request.

(18) ANTARCTIC HUMPBACK WHALE CATALOGUE

The Antarctic Humpback Whale Catalogue collates photo-ID information from Southern Hemisphere humpback whales. Increasing awareness of the project among research organisations, tour operators and other potential contributors has widened the scope of the collection; research efforts in areas that had not previously been sampled have extended the geographic coverage. This catalogue has grown by 25% in the last two years, adding 1,127 new individuals and increasing the time required to analyse photographs. In addition to these requested IWC funds will also be sought from other sources to provide the remaining funds required. Additional resources are provided by College of the Atlantic, including equipment, student assistants and time donated by principal investigators of this proposal. As a result this catalogue is in an excellent position to make a substantial contribution to SORP and other research and management initiatives.

(19) PHOTO MATCHING OF ANTARCTIC BLUE WHALES

The goal of this project is to compare the existing IWC-SOWER Antarctic blue whale catalogue (about 160 individuals) and the existing photo-ID material collected from JARPA which are already digitised. This project may add new individuals to the Antarctic blue whale catalogue and provide new data on the movements of Antarctic blue whales both within and between years. The Committee has requested for several years that this work be undertaken.

(20) SOUTHERN HEMISPHERE BLUE WHALE CATALOGUE 2012/13

The Southern Hemisphere Blue Whale Catalogue is an international collaborative effort to facilitate cross-regional comparison of blue whale photo-ID catalogues. Results of comparisons among different regions in Southern Hemisphere will improve the understanding of basic questions relating to blue whale populations in the Southern Hemisphere such as defining population boundaries, migratory routes and model abundance estimates. In 2008, the Committee endorsed a proposal to establish a central web-based catalogue of blue whale identification photographs, known as the Southern Hemisphere Blue Whale Catalogue (IWC, 2008e).

Currently this catalogue holds photo-ID catalogues of researchers from major areas off Antarctica, Australia, eastern South Pacific and the eastern Tropical Pacific (IWC, 2011i). Comparisons among catalogues off Chile found one match over ten years (Vernazzani and Cabrera, 2011). Preliminary results of the 2011/12 catalogue comparisons between the eastern South Pacific Ocean, Eastern Tropical Pacific Ocean (ETP) and Southern Ocean found no matches (SC/64/SH20).

During 2012/13 it is expected that comparisons between Australian catalogues and with the ETP, southeast Pacific and Antarctica will be finalised. Results of these comparisons will be presented to the 2013 Annual Meeting.

Special Permits

(21) EXPERT WORKSHOP FOR FINAL REVIEW OF ICELAND'S SPECIAL PERMIT PROGRAMME ON COMMON MINKE WHALES

Activities under Article VIII of the Convention should be reported to the Committee for review. The Committee has agreed a procedure for periodic and final reviews of results from Special Permit research (IWC, 2009i). This procedure outlines an intersessional review meeting by an expert panel. The report from the intersessional expert meeting will be reviewed and discussed at the 2013 Annual Meeting, SC/65. The Icelandic Special Permit progamme on common minke whales is complete and thus is subject to a review by an expert panel during the 2012/13 intersessional period. The experts to the review Workshop will be identified by September 2012 and the expert Workshop will be convened during four days in February/March 2013. The requested funds are for travel for the invited experts.

Whalewatching

(22) WHALEWATCHING GUIDELINES AND OPERATOR TRAINING IN OMAN

Oman's whalewatching industry has experienced gradual growth over the last 10 years reflecting a steady increase in tourism in the country and a growing awareness of the rich and accessible cetacean fauna, especially around the capital city of Muscat. Currently, dolphins are the main target of the industry, whilst sperm whales and other large whales are increasingly sighted as operators become more knowledgeable of their presence and distribution. The Arabian Sea humpback whale has recently become a target of opportunistic whale watching by a SCUBA dive operator in southern Oman. The precarious status of this species, represented by a resident and discreet sub-population numbering fewer than 100 individuals, and the identification of escalating anthropogenic impacts and threats has led to expression of serious concern by the IWC and recommendation for the development of a Conservation Management Plan (work in progress). Unregulated whale-watching represents another potential threat to Arabian Sea humpback whales.

Most operators are currently unaware of (unofficial) guidelines for whalewatching in Oman. Recognising the need to complete the drafting of new guidelines for Oman with appropriate technical assistance, and to train operators to enable interpretation and implementation of guidelines, this proposal includes a request for funding to complete the revision of whalewatching guidelines in Oman and to hold a training workshop for operators on the interpretation and implementation of the guidelines to promote best practice in the industry. Travel for relevant experts to Oman has already been secured and expert and other participant time will be donated and/or covered by other on-going projects.

All groups

(23) INVITED PARTICIPANTS (IPS) FUND

The Committee **draws attention** to the essential contribution made to its work by the funded IPs. The IWC-funded IPs play an essential role in the Committee's work, including the critically important role of Chairs and rapporteurs. They represent excellent value as they receive only travel and subsistence costs and thus donate their time, which is considerable. As was the case for previous meetings, where possible, effort will be made to accommodate scientists from developing countries.

24. WORKING METHODS OF THE COMMITTEE

24.1 Reducing the costs of Committee meetings

In 2011 the Commission asked the Secretariat to continue exploring opportunities for cost savings. One source of cost savings is to reduce freight charges and increase use of electronic documents at Annual Meetings of the Scientific Committee and Commission. A review of expenditures in 2011 indicated the costs of maintaining a paper based infrastructure for the meetings was around 5% of the IWC core budget. Particular costs arise because of packing and air freight of the pigeonholes and pre-prepared documents which are both heavy and bulky and also the hire of high volume copiers which are usually dramatically more expensive than low volume copiers.

The Committee discussed the advantages and dis-advantages of moving to electronic distribution of primary papers, working papers and reports. If there was to be electronic distribution of paper, then the memory sticks with the primary documents will need to still be available in a timely manner. Members would be encouraged to submit meeting papers as soon as possible to allow other members to make their own copies at home before the meeting. There would also need to be a number of modern desktop laser printers available to members and especially a local high bandwidth secure wi-fi network and document server that would be available to only the Committee members and so would be independent to local internet access and thus be robust to local IT issues.

After much discussion, the Committee **agrees** that primary documents should be distributed wholly electronically both on the IWC website and on memory sticks. In contrast, the Committee **agrees** that draft and final reports of sub-groups and plenary should be distributed by paper to ensure these reports are properly edited. The Committee also **agrees** that working papers should, at least for a trial period, be distributed mostly by paper, with the option of some working papers, particularly very long ones, be distributed mostly electronically. To reduce freight costs of the pigeonholes, the Committee suggests the Secretariat consider having pigeonholes for sub-groups as a means to distribute working papers rather than having personal pigeonholes.

24.2 Clarifying information on data availability for Procedure B requests

The present description of the process for obtaining data for issues that fit under Procedure B is described in the Data Availability Agreement (DAA; IWC, 2004c). SC/64/SCP1 described a recent incident where it became evident that the DAA process needed additional clarification. The Committee notes that the DAA process has generally worked well and especially so when the Committee has been able to properly specify the data request during the Committee meeting. Procedure B is designed for cases where the Committee itself believes that particular analyses (whether completely new analyses or revised analyses) are important in providing advice to the Commission. In such cases, it is important that the Committee takes the necessary time to complete and explicitly including the following within the report: objectives of the data request; details of the data required addressing the objectives; broad overview of the methods; and the principal investigators recommended by the Committee. With such report text, the Data Availability Group (DAG) can then complete and endorse a DAA request following the appropriate protocol in a timely manner. This would have, for example, removed the ambiguity that arose out of interpretation of the recommendation made last year on the blubber thickness analysis (IWC, 2012n).

As the requests under Procedure B relate to Committee recommendations, it also seems appropriate that all correspondences between researchers and data holders are channelled through the DAG until a request has been granted. It should also be emphasised that DAG involvement in data requests applies only to requests based on recommendations by the Committee. Requests by individual scientists should occur at the bilateral level without DAG involvement.

In addition, there appears to have been some uncertainty over what is meant by collaboration and offers of co-authorship under the DAA. This has also been considered under Item 17, Special Permit reviews and 'Annex P'.

The Committee has always encouraged collaboration in all research projects. In the context of Annex P this was clarified in a footnote. For a more formal clarification, the Committee recommends an additional point be added to the DAA Procedure B text as follows, where the text under Item 2 is new:

Procedure B

This applies to data required for analyses deemed important in providing advice to the Committee other than catch limits (e.g. on the status of stocks not subject to whaling). For data not subject to Procedure A, the data owners shall produce, in collaboration with the Committee, a published protocol for data access that applies to requests generated by the Committee, to ensure clarity and a mutual understanding of the process.

(1) The Committee shall specify the nature of the work and the data required during the meeting at which the recommendation is made, to the fullest extent possible in the time available at the meeting and in accordance with the published protocol. It should also name the appropriate scientists to undertake the work and designate an appropriate timeline.
(2) The Committee encourages collaboration between the data requestors and data providers, although this is not mandatory. As a minimum, data requestors and providers should discuss the data sufficiently to avoid misinterpretations over the nature of the data themselves. When the data requestors send their draft paper to the data providers in accordance with the timetable, they must provide an offer of co-authorship to them. The data providers may or may not accept this offer. If data requestors and data providers do not agree with the contents of the paper then they may present separate analyses or comments to the Committee. This then allows the Committee to review all analyses. The Committee will then get a balanced single conclusion from the analyses for advice to the Commission. This is in line with the spirit of collaboration the Committee encourages.
(3) Applications to the data owners following the published protocol referred to above, should be submitted by the Data Availability Group assisted by a nominated member of the relevant delegation or institute. The Data Availability Group will consult with relevant members of the Committee if further explanation or clarification is required.
(4) If the above process is followed, then the data owners will normally approve the applications within a specified time period in accordance with the published protocol.
(5) Applications shall only be granted under the conditions given above.

24.3 Updating the Committee's guidelines and Handbook

After discussion last year, the Committee agreed that the Chair of the Scientific Committee should develop a review document for consideration at this year's meeting that discusses whether or not there is a need to expand on the guidelines related to Convenors, in particular with respect to further details about the roles of Convenors and co-Convenors, time frames of service etc., as well as the roles of Heads of Delegation and, if so, to provide proposed text. This review document provided background information that clarified some of these issues and suggested additional text to be considered by the Committee that could be added to the Scientific Committee's Handbook (SC/64/SCP2).

This year the Committee discussed this review document and **recommends** the basic responsibilities of Convenors and co-Convenor's as described in the Handbook did not need changing. However, it **recommends** that the full Committee should receive the list of proposed projects to be funded by the Commission in a timely manner to allow everyone to fully consider the prioritised list. Following this recommendation, the guidelines on the role of Convenors should include a new item 'f' and move the present 'f' to 'g', where the new item 'f' should read:

'To develop with other members of the Convenors' Group a prioritised list for funding that should to be made available to the full Committee at least by 6pm on the penultimate day of the Scientific Committee Annual Meeting.'

Co-Convenors were created three years ago to assist some of the busier sub-groups and provide an opportunity to create a pool of experienced people that could become future Convenors. This concept has worked well, so the Committee recommends the following text on the eligibility of Convenors and co-Convenors be added to the Handbook:

'All Committee members are eligible to become Convenors or co-Convenors. A co-Convenor may be appointed to assist the Convenor of a sub-group, gain experience in chairing and learn Committee procedures. Requirements include appropriate scientific background and/or chairing experience, knowledge of Committee procedures and appropriate communication skills.'

The Committee discussed at length the time frame of Convenors' service. Some members suggested a general, though flexible, time frame could be added to the Committee's guidelines, where this time frame would not a fixed length and would not be mandatory. However, other members considered the existing guidelines were sufficient and have worked effectively in the past and so did not need to be modified. Consequentially no changes to the Committee's guidelines were recommended this year. However, as noted in the existing guidelines, it was agreed that the Chair of the Committee would take carefully into account the length of service when choosing Convenors. If necessary this issue can be revisited in future years.

The roles of Heads of Delegations were also discussed and the Committee agrees that the present guidelines are adequate as provided in the Handbook. The Committee also agrees that the Handbook, when updated, will also be available as a pdf file.

24.4 Assistance to new members on the working of the Committee

In order to assist new members, the Committee recommends that an introductory lecture should be given during the first or second day for new (and indeed any) members that would cover primarily practical issues including: methods of working; background history of the sub-groups; and commonly used acronyms (the latter will also be added to the Handbook). In addition, the Committee **recommends** that all attendees are reminded of the website location of the Scientific Committee's Handbook when registering for the Annual Meeting.

24.5 Other

Galletti noticed that while management recommendations are widely given in some sub-committees, especially when addressing whaling issues, in other sub-committees and/or standing working groups, the attention seems to be more focused on scientific recommendations and only a few conservation recommendations arise. She believed that his was particularly true for small cetaceans, where there have been differences throughout the years. In this sense, the practice of the Scientific Committee should be reviewed and when there is concern over the status of any cetacean species or threats are identified, there should also be a focus on providing conservation recommendations.

Given the limited time available at this meeting, the Committee **agrees** that this matter should be placed on the agenda for discussion at next year's meeting.

25. ELECTION OF OFFICERS

This is the third and last year in the terms of the Committee's Chair (Palka - USA) and Vice-Chair (Kitakado - Japan). Kitakado has agreed to assume the position of Chair of the Scientific Committee at the end of the 2012 Annual Meeting. To fill the vacant Vice-Chair position, the Heads of Delegations were happy to unanimously nominate Caterina Fortuna (Italy). Fortuna accepted the Vice-Chair position. The Committee stood in acclaim to thank Palka for her great contribution to the Committee's work during the past three years and congratulated Kitakado and Fortuna on their new positions.

26. PUBLICATIONS

This had been a difficult year for the *Journal* with staff limited by maternity leave, reduced hours, illness and a change in staff. Despite that the department produced:

(1) the 520 page *Supplement*;
(2) 3 issues of the *Journal* (two are at the printers) with one more almost complete; and
(3) the Special Issue on Southern Hemisphere humpback whales.

Illness to Donovan resulted in less progress than anticipated on the Special Issue devoted to the RMP but the timetable for its publication has been finalised and it should be available in early 2013. Most of the chapters written by Hammond and Donovan are nearing completion and will be ready for formal review in autumn 2012. These include: (1) an introductory guide to the RMP; (2) a history of the scientific approach to whale management within the IWC prior to the RMP development; (3) a history of the RMP development process including the development of various Requirement and Guidelines; (4) a history of the *Implementation* (and *Implementation Review)* process summarising the cases for western North Pacific common minke whales, western North Pacific Bryde's whales, North Atlantic common minke whales, and North Atlantic fin whales; and (5) a concluding overview. In addition, the volume will include the papers from all of the original developers summarising their work in the format determined by Kirkwood. Allison is preparing the appropriate graphs and tables in the new format, including the results of the cross validation trials developed after the *CLA* was adopted.

The special volume commemorating the IDCR/SOWER cruises will be undertaken under an Editorial Board under Bannister as reported elsewhere.

The testing and trial process for the online submission, review and finalisation process has been recently completed and has recently become operational – thanks are due to those members of the Committee who kindly acted as 'guinea pigs' and have helped shape the site and develop the online instructions.

All of the *Journal* volumes are now available as pdf files and the *Journal* will become available in that format either directly via the new IWC website or through an existing company; we are in the process of examining the practical and financial implications of this and will report back to the Committee next year, after consultation via a questionnaire by email. This issue has become particularly important given the difficulties with printers that have occurred over the past two years and the recent news that the Cambridge University Press printing division is likely to be taken over by another company.

The Committee thanked Donovan and his team for the excellent work on publications. It **reiterates the importance** of these to its work as well as providing outside scientists the opportunity to benefit from the Committee's work and to encourage co-operation.

27. OTHER BUSINESS

No other business was discussed.

28. ADOPTION OF REPORT

The report was adopted at 17:00 on 23 June 2012. As is usual final editing was carried out by the Convenors after the meeting. In closing the meeting the Chair thanked the Secretariat for carrying out its duties in its customary friendly and efficient manner, as well as once again thanked the Government of Panama and other Panamanian contributors for their hosting of the meeting and for providing snacks and lunches for us, which greatly enhanced productivity and mental health.
